Bursting of grindstones was a common occurrence under these circumstances, happening sometimes soon after the stone was hung, but frequently after being weakened by wearing away a part of it. Grindstones are generally hung at nail works by means of two heavy cast iron plates with square holes and a heavy square boss cast on the outside. Four holes are bored through the stones near the corners of the eye, corresponding with the four similar holes in the plates, through which four bolts pass and fasten the plates securely to the sides of the stone by means of nuts. A square shaft passes through the center of the plates, and the stone is adjusted by means of eight set screws passing through the boss, and resting against the sides of the square shaft. This relieves the eye of the stone from any strain, but the tendency of the four holes in lines with the corners of the eye is to weaken the stone in these directions. A case occurred of grindstones having been burst by using cast iron plates with a square boss four inches long, cast on the inside of the plates and tapering toward the end which was fitted snug into the eye of the stone and the plates being pressed against its sides, the tapering boss acted as a wedge, and two stones were burst in this way before the cause was discovered.

TASTE IN CHANDELIER MAKING.—Perhaps the most prominent piece of metal work seen in our rooms is the chandelier. The various devices used to torture this material into outrageous forms, without taste or method, are commendable only for the versatility of genius which originated such designs, and remarkable chiefly for the absence of all art in their production. That thiness which is one of the legitimate conditions to be observed in the artistic treatment of this material seems utterly lost sight of, and heavy castings, apparently strong enough for an anchor of a 74, are continually produced. To invest metal with forms which might as well be executed in stone or wood is equally absurd; and some went so far a few years ago as to make gas fixtures and standards of these materials. The idea that these are simply tubes for conveying gas is apparently forgotten, even by those who are considered in advance, and huge pedestals are placed on top of the stair newels, which seem to groan beneath their weight.—*Harper's Magazine.*

How Large Metal Coils are Made.

To give our mechanical readers an idea of what the English consider the magnificent in metal working we give an account of forging the immense coils from which the heavy guns are made at the Woolwich arsenal. We condense from the *Colliery Guardian*:

A 12 cwt. pile was brought splendidly hot from one of the heating furnaces, and rolled down to a bar of about 14 feet long with dimensions of about 7¼ by 7 by 6, the bar being so shaped to permit of its coiling; when welded to others making one whole bar, measuring 170 feet, and weighing 12¼ tons, it has again passed through a furnace 100 feet in length. The bar was coiled around a revolving mandrel with comparative ease. The mandrel affixed at the mouth of a furnace of the above great length was worked by hydraulic power, and in revolving drew the bar out of the furnace with an easy determination, which for force was only excelled by a subsequent operation. The first grip of the bar was obtained by hooking its nose, through which, before it was put in the furnace, a hole had been punched, on to a stud affixed to the mandrel. With only little apparent effort bars of much larger dimensions are coiled by the same process—bars weighing 56 tons. One such bar was manipulated into a trannion coil. The coil was brought out of the furnace where it had been heating for 50 hours, at a cost in coal of some 25 tons. Aided by two cranes, each capable of lifting 100 tons, and a pair of tongs, weighing about six tons, a corps of fine-built workmen, who, however, at such work seem dwarfed to Lilliputians, swung the coil on to a 750 ton hammer block, that had in turn for its foundation one hundred 50 foot piles, 14 inches square. The hammer head weighs 40 tons, and with steam behind it has a force equal to 2,000 foot tons (foot-tons mean tons possessing a force given to them by a one foot fall.) The hammer stood there at an elevation from the ground of some 56 feet. Most delicately, like Poe's raven, it came tap, tap, tapping, for those blows, mighty though they were, seemed but as taps upon this huge coil, so firmly erect did it stand beneath the oft-descending hammer. The coil had not only to be compacted into a tube with comparatively solid sides, but it had to be kept perfectly true in its center; from the opposite side of the hammer there was therefore at this juncture reared by the aid of the cranes and another pair of gigantic tongs, a steel mandrel, which was soon forced into the center of the coil by the hammer. The 56-ton coil, now heavier by many tons, was next rolled over upon its side upon the hammer block, to have the coils beaten around their external circumference and the interstices between the coils wholly closed. The trunnion coil, it need hardly be explained, is the heaviest portion of the 81-ton gun. Upon the coil which surrounds the inner steel tube this trunnion coil, after it has been turned to an exactness which experience has demonstrated will accomplish the purpose is heated to a black heat over a wood fire, and the shrinking of the monster coil in becoming cool clips the rest of the gun with a firmness which makes the whole virtually one solid mass.

USING STEAM BOILERS.—The London *Mining Journal*, after reviewing the causes of boiler explosions, says that in the use of boilers two great fundamental principles may be taken for granted—*i. e.*, that to purchase one simply because of its cheap price is the worst policy that can be adopted, because in almost every case the article will be sure to be a useless one; and, secondly, every explosion is invariably preceded by due warning, which cannot be misunderstood by those accustomed to steam and which if disregarded, will inevitably prove disastrous. If the makers and the users of boilers would continually keep these two great essentials in view there would soon be a palpable and praiseworthy diminution of accidents, and the loss of life would be reduced to a minimum. For our part we think that every boiler should be made to bear a pressure of at least 70 or 75 pounds per square inch, nor do we think any great hardship would result if it were rendered compulsory that makers should only use iron of such a brand as guaranteed to stand such a pressure. If to this were added a requirement that every boiler should undergo periodical inspection by the properly qualified person in charge of the boiler, and that the result of such inspection should be recorded in a book kept for such purpose, and which could be produced in case of accident, then we think that both the maker and the user of boilers would have done all that could be reasonably required of them in the "interests of public safety."

AN AXLE TO EACH WHEEL.—A new car truck is at present being constructed at the car shops of Billmeyer & Smalls, in York, which is said to be the invention of a gentleman named John M. Brosius. Each axle under this truck is severed in the center, instead of extending from wheel to wheel. The inner ends of the axles each work in a box, and are independent of each other, so that in running around a curve each wheel will run the exact length of the track, and thus prevent slipping.

AN ICE BOX.—A huge refrigerator at Brussels can contain 50,000 pounds of meat; there is room for 1,000,000 tons of ice. It covers 18,000 square feet, and contains nine compartments of 30,000 cubic feet each. The walls are double, and filled with moss and sawdust.

SCIENTIFIC PROGRESS.

The Preservation of Timber.

During the last 20 years, several methods have been tried for making timber more durable, the principle of which consists in expelling the sap remaining in the ligneous fibres, in order to replace it by chemical solutions, such as sulphate of copper and creosote; but these processes, comparatively costly, and only partially successful, do not entirely accomplish their object. Starting from the fact that oak, chestnut, and certain American trees resists the action of air and damp better than others, and they owe this property to the tannin which they contain, a chemist proposes to tan the timber by substituting for the sulphate of copper and creosote a compound of tannic acid and iron. The object of injecting various substances into wood is to poison them, so that germs and microscopic growths may no longer live and propagate either on the surface or in the interior. Now tannin is one of the most active and certain destroying of germs both vegetable and animal, which in fact accounts for its preservative agency. Besides, it is to tannin that is due the almost indefinite preservation of leather. One peculiarity to be noticed in this process is that timber treated with this compound of tannin and iron, that is to say a composition similar to ordinary writing ink, is turned black.

The process of injecting timber with tannate of protoxide of iron is due to M. Hatzfeld; the Eastern railway company of France has experimented with it on some sleepers, and the telegraph department on some poats.

M. Boucherie has denied, in a note to the *Academie*, the efficacy of this process, contending that the attempts already made to preserve timber from dry rot by injecting it with iron salts have yielded only partially successful results, while sleepers treated by sulphate of copper have lasted 25 years and more. Reply is made to these objections by quoting—not the experiments of the laboratory or workshop, but those made by time itself. It is not a rare circumstance to encounter in earth of a ferruginous nature the trunks of very old oaks, blackened and perfectly preserved; at Rouen, in 1830, some old oak pailing was discovered as black as ebony, and dating back to the Middle Ages. Not very long ago, too, a Norman vessel built of oak was discovered in an almost perfect state of preservation in the neighborhood of an iron mine in Norway. It is more than probable that the preservation of the oak under these circumstances is due to the tannin contained in the wood; it follows, therefore, that by introducing a substance rich in tannin into timber that does not naturally possess it, its resistance to decay is increased.—*Jour. Society of Arts.*

LIGHTNING IN STEAM.—It would startle many people who happen to see a locomotive blowing off steam in a railway station, if they were told that there is electricity enough generated in the discharge of steam to blow the whole train of carriages to atoms, if instead of being dissipated they were collected. The fact was first accidentally noticed by an engineer at Newcastle, who perceived sparks, which proved to be electrical, among the escaping steam. The discovery was confirmed by the construction of a hydro-electric machine in the shape of a boiler set on glass legs. The steam as it rushes out of the escape valve is received on a series of metallic points, by which it is gathered and accumulated in the conductor, as in an ordinary electric machine, in which the electricity is generated by the friction of a glass plate or cylinder. Will engineers ever come to appreciate the fact that every locomotive carries the means of lighting itself far better and more cheaply than any lamp?—*Ex.*

MEIDINGER'S BATTERY.—In a recent number of *Dingler's Polytechnisches Journal*, M. Meidinger gives a description of what he considers the best form of his battery, as now used on the Baden lines. It is different in several points from that constructed by Siemens and Halske, and it is said to be more durable, economical, etc. On the bottom of a cylindrical glass pot rests a short conical glass vessel, with broad plate foot. A lead ring lines the wall of the latter vessel and serves as a negative pole, a strip of lead rising from it to the top of the outer vessel. Round the interior of the latter is a zinc cylinder reaching to near the top and a copper strip rises from it to the exterior. Above, a glass balloon is supported on the edge of the outer vessel, having its mouth below stopped with a cork, through which passes a little glass tube. The mouth is at about the middle of the inner glass vessel. The lower vessels are filled with dilute Epsom-salt solution; the balloon with sulphate of copper.

ELECTRICAL CONVERSATION.—Professor Bell, of Boston, and Sir William Thompson, the celebrated electrician, have lately made some interesting experiments in the transmission of vocal sounds and instrumental music by telegraph. An organ in the Atlantic and Pacific telegraph company's office in Boston was played, and the different tunes were easily distinguished by the operator in New York, and conversation was carried on between two Boston offices. A few days ago conversation was carried on between Boston and Rye Beach, New Hampshire, which are sixty-nine miles apart.

Magnetism in Steel.

Some important observations respecting the magnetic force contained in different kinds of steel have been made by Herr Fromme. In his treatise on this subject, published in the *Nachrichten der Gottinger Gesellschaft der Wissenschaften*, he points out the influence which the tempering of steel has on the remaining magnetism. Passing over the well-known fact that steel is a body more retentive of magnetism than any other with which we are as yet acquainted, he proceeds to say, that science has proved its magnetic properties to be regulated by two conditions, namely, its chemical composition and its mechanical treatment. The former varies according to the amount of carbon contained in the steel; the latter is regulated by the slow or quick method of tempering the metal. The magnetic properties of steel are regulated by these two conditions, and vary in accordance with them. Since Coulomb's experiments in regard to the influence of tempering on the magnetism of steel, various scientific men have, according to Herr Fromme, pronounced annealed steel to be most retentive of magnetism; others, again, have asserted chilled steel to be superior in this respect. Ruths was the first to throw light on the subject by discovering that the power of retaining magnetism differs with the dimensions of the magnetized bars of steel. Cylindrical bars, in which the length stands in a proportion of 30 to the diagonal, retain least magnetism when in a hardened state, more in a yellow annealed one, and most when the steel is blue annealed. The same is the case with thicker bars, as long as the inducted current is small; a change takes place with the induction of a greater current, so that, in general, bars in which the length stands in a smaller proportion than 30 to the diagonal—the hardened ones show the greatest retentive power. In short, with less magnetising power, an annealed steel bar accepts more magnetism than an ordinary hardened one. But as the magnetism in the hardened steel bars increases in a greater proportion than in the annealed ones, a greater magnetic power is evenly attained in the former. The thicker the bar is in proportion to its length the less is this indifferent magnetic power.

TECHNICAL SCHOOL AT ROUEN.—A knowledge of the art of dyeing is a matter of great importance to a large number of people. Not content with the rough and ready plan, usually followed in England, of taking a lad from school and putting him into a dyehouse to learn "practically," as it is supposed, the mysteries of the trade, the Rouennais have a School of Industry, to which is attached a chemical laboratory. In this are received pupils who for two years study not only elementary chemistry and ordinary reactions, but make a really practical and intelligent acquaintance with the dyeing and printing of textile fabrics. In a course of 250 lessons specially addressed to this end, supplemented by independent manipulation, the pupil learns all the details of the business for which he is being trained; to colorists are explained all that is known concerning dye drugs, grinding machinery and the apparatus needed for preparing colors or using them afterwards.—*Iron.*

FORCE EXERTED BY GROWING PLANTS.—About four or five years ago the platforms at our station here (Mitcham Junction) were laid down with a thick coating of asphalt. Nevertheless, such is the force of growth and endurance existing in the roots of the coltsfoot (*Tussilago farfara*) that every year it forces its way through the asphalt, despite the hardness of that material. The asphalt is pushed up into little hillocks, which gradually crack; very soon the young leaves make their appearance, and afterwards the whole plant. The common thistle I have also noticed doing the same. Let any one take a cake of asphalt and try to push a stick through it; he will then be able to realize how great must be the vital force exerted by the plant-roots in question, which, by adding particle after particle to their structure, are enabled to upheave and displace such a hard, compact material as asphalt.—*London Garden.*

AMBER.—Reboux states that at the eocene epoch the bed of the Baltic sea was occupied by an immense forest, which spread over nearly the whole northern continent. Dredging carried on at a depth of 6.4 feet below the sea bottom has brought to light thereby two species of conifers, a poplar, a chestnut, and various other trees. From the conifers, the author thinks, ran the resin which, through being buried in the earth, has become changed into amber. The largest quantity of the gum appears to have been derived from the *Pinussuccinus*. More than 200 specimens of objects have been found imbedded in the gum, including insects, reptiles, plants, leaves, grains, shells, fruit, etc. The density of natural amber varies from 1.09 to 1.11. Its analysis, according to Schrotter, is: Carbon, 78.82; hydrogen, 10.23; oxygen, 10.90.

LARGE SOLAR PHOTOGRAPHS.—M. Janssen writes that daily photographs of the sun are now made at the Montmartre observatory. The solar disk has been photographed 8.5 inches in diameter, with great clearness. The spots, faculæ, and granulations are distinctly marked, and are of sufficient size not to be obscured by the grain of the paper. The solar surface at the present time is completely free from spots, this being the epoch at which the same are at their minimum.

The Mining Share Market.

Business at the Stock Boards remains in a quiescent condition, and some of the sessions during the past week have been as dull as ever experienced. It is supposed that a good many of the sales are "washed" ones so as to keep up a semblance of brisk business. The record of sales for the week will be found in another column.

Accounts from the mines continue good and bullion comes in freely from some of them, as will be seen by the item in another part of this issue. Northern Belle is the mine which seems to have attracted the most attention from the stock dealing community of late, and a brisk business has been done in these shares this week.

The Assessor's quarterly roll shows the gross proceeds of the mines of Storey county, for the three months ending July 31st, to have been as follows:

Mine.	Value per ton.	Gross Yield.
Belcher	$21	$ 887,010 00
Crown Point	15	344,082 00
Chollar-Potosi	20	94,289 00

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

Mining at Volcano.—Cor. Amador *Dispatch*, Aug. 12: The Volcano gold gravel mining company commenced the work, and broke ground for the tunnel on the 31st of July, and the work has been pushing an as rapidly as possible ever since, and will continue to be pushed on until the great enterprise is completed. The people of Volcano are waking up—they see the vast amount of good that will be accomplished when the tunnel is completed. It will open up a large mining country that has been idle for years, and millions of gold reclaimed from its bed of long seclusion. Now this enterprise will open up and drain this flat at a depth of 44 feet below the old works. The agent of this company was up from San Francisco, and at a called meeting at the town hall gave the views and explanations in regard to the enterprise, which appeared to be satisfactory to a large number of the citizens. The bright prospect of Volcano's future glory is radiating the hitherto forlorn looking countenance of nearly all her citizens. Volcano will soon be one of the best and richest mining camps in the county.

Big Clean-Up.—Cor. Amador *Ledger*, Aug. 12: The Amador Consolidated mine, of Sutter creek, as the result of last month's operations cleaned up $25,000—the best yield they have realized in many months.

CALAVERAS.

Quartz.—Calaveras *Chronicle*, Aug. 12: Saturday last we visited a few of the principal quartz mines in this vicinity, and found that operations are being industriously forwarded. At the Quaker City mine, near the Junction, work is still confined to running the 200-ft level. At the distance of 80 feet from the shaft the ledge shows as good as ever, with no indications of approaching the terminus of the pay chute. There is evidently an immense body of rich ore in the mine, the full extent of which is not yet determined. At the Lamphear mine everything has been got in tip-top shape for working, and labor upon the contract for sinking the shaft an additional 100 feet was commenced yesterday morning. The shaft has recently been put in good repair, and work is to be pushed energetically. At the Boston mine work is confined to getting the mill in running order. It will probably be ready the latter part of next week.

Gwin Mine.—The Gwin mine continues its regular gold product. The sinking for the 1200-ft level is completed. The new machinery for the lower or Alexander mill will be finished about the middle of the month, which will increase the crushing capacity and at the same time materially reduce running expenses by permitting the water purchased for motive power to be used twice. Everything connected with this mine is looking first-rate.

Specimen.—We have been shown a very pretty gold specimen, by Mr. Schlund, of this place, who deals in this article. The *chispa* weighed about four ounces. It was taken from the mine of Jackson, Miller & Co., near Central hill.

Upper Country Mining Jots.—At West Point there has been but little change since our last report. Work is progressing favorably at all the mines. Champion still sinking. A crushing of rock is on the dump, which is to be hauled to the mill shortly. The Josephine mill is finished, but has not been started yet. Mina Rica still running the 300-foot levels and getting good rock. San Bruno, at Mosquito, still pumping water.

Mount Tmolus Mine.—The contract taken by the Messrs Rigney for sinking the shaft in the Mount Tmolus mine, Jesus Maria district, is completed. The shaft is now 82 feet in depth, all the way in fair grade ore. Water was struck in the shaft just as the last sinking was completed. Mr. C. J. Nelson, superintendent of the mine, informs us that the company owning it are not yet fully determined upon the next step in its development.

A Good Clean Up.—Veith, proprietor of the big hydraulic on Tunnel ridge, cleaned up lately after a short run. Two thousand dollars were netted, averaging a yield of $200 for every day water was run. It will bother hydraulics anywhere to beat that, and it is a steady thing in the Veith claim. Calaveras hasn't got through supplying the world with gold yet.

CONTRA COSTA

Empire Coal Mine.—Antioch *Ledger*, Aug. 5: A recent visit to this newly opened coal mine convinces us that, beyond a question of doubt, the Empire will, when fully developed, prove one of, if not decidedly the most profitable of the numerous Diablo coal bonanzas. It is true that the quality of coal thus far taken out for shipment has been severely criticised, and that in quality it is probably not equal to the best of the Black Diamond or Central products, yet when it is remembered that the coal now being extracted is taken out at a depth of only 160 feet from the surface, the fact is apparent that no vein of coal yet opened on the coast ever produced as good a quality at the same depth—virtually croppings. Examination of the mine also shows that at the present depth the quality of coal now being extracted from the east side of the slope, which brings it at a greater depth from the surface—the breast running under a hill—will compare favorably with that of the Somersville or Nortonville mines. For several weeks past the owners have shipped about 50 tons daily, but with the completion of the contemplated railroad from the mine to Antioch, a distance of five miles, and the opening of the middle vein by running a drift 240 feet southward from the bottom of the slope, the work of which has already been commenced, probably between 400 and 500 tons will be shipped daily.

EL DORADO.

The Kelsey Mine.—El Dorado *Republican*, Aug. 10: During the past three or four months, under the superintendence of Mr. B. C. Hodge, the tunnel in the Kelsey has been extended about 75 feet along the ledge, making the entire length of the tunnel about 150 feet. At the end of the tunnel the ledge was cut, and looks exceedingly fine. The ledge is four feet thick and well defined. The rock is of the same character as that taken out of the old Pacific, in this city, and the Kelsey is doubtless on the same vein. Millions of dollars were taken out of the Pacific, and the general belief of those who are familiar with it is that it can be made to give up millions more. The Kelsey has the most promising outlook of any partially developed mine in the county, we think, to-day.

The Robinson mine, at Prospect flat, is again looking up, a rich bed of gravel having been struck recently, and gives promise of a yield greater than has heretofore been produced. This, for several years, was one of the best paying mines in the county.

FRESNO.

Placer Mines.—Fresno *Expositor*, Aug. 9: We learn that a considerable excitement prevails at Centerville and vicinity over the reported discovery of rich placer mines on Mill creek. We understand that L. A. Clarke exhibited some large specimens of gold that he found. A number of persons have visited the mines and located claims. Mill creek is a tributary of King's river, and rises in the eastern portion of the county. Rich copper and gold-bearing quartz has been discovered in the vicinity. We hope the newly discovered mines will prove as rich as reported.

LAKE.

The Eclipse Quicksilver Mine.—Lake County *Democrat*, Aug. 12: The company organized last week for the purpose of working this valuable mine have a gang of four men at work. There is every indication from the appearance of rock already uncovered that this mine will prove one of the richest in Lake county. It is located between the Uncle Sam mine and Thurston lake.

MENDOCINO.

The Gold Region.—Mendocino *Democrat*, Aug. 12: We hear that J. St. Robertson, with several men, came up last Sunday from San Francisco to work in the supposed gold region near Calpella, and it is said a large additional force may be expected in ten days or so. The first move is to look out and procure the most practicable route for the conveyance of water, and this is what Mr. R. will start on. We are told Calpella lots are being applied for. By the way, anyone wishing to confer with Mrs. Captain DeWolf, can find her address at the office of Dr. Barnes, Ukiah; at the Calpella hotel, Calpella; or by calling on Mrs. E. R. Worth, Worth house, San Francisco.

MONTEREY.

Coal.—Watsonville *Pajaronian*, Aug. 10: We understand from good authority that the coal mine is now being developed by Slader & Co., on Ford & Sanborn's property, near Corralitos, is giving very encouraging indications. The coal now being taken out is of excellent quality and promises well in quantity, and better as a greater depth is reached. A good deal of interest is felt here in the perfect success of the mine.

NEVADA.

From the Ridge.—Cor. Nevada *Transcript* Aug. 12: The Weaver dam, at the head of the Miner's ditch, gave way on Wednesday afternoon, and an immense body of water came down the river, carrying everything before it. Every flume and wing down the middle Yuba was washed away, and quite a number of Chinamen barely escaped drowning in their cabins, one mile below here. The rush got down here at 11 o'clock last night. The Weaver dam is one of the oldest of the Eureka lake company's dams. The company have been repairing and raising it up some time. I have not been able to find out the amount of damage that has been done, but as there is no water in the Milton or Miners' ditches to-day, I suppose considerable damage has been done to those two ditches. The Chinamen have lost everything, and are cleaned out cleaner than a shotgun. No lives were lost, as the dam broke after quitting time last night.

A very rich ledge was struck last week in the northern part of Washington township, in the vicinity of the Yuba mine. The ledge is four feet in width and is literally speckled with free gold and galena sulphurets. That is the most promising field for prospectors in the county.

The Gold Run mine, of this place, produced $5,500 in gold bullion last month.

Milton Tunnel.—*Foothill Tidings*, Aug. 12: The Milton tunnel, at French Corral, is now running and using 1,000 inches of water, the company will be able to make a full work of sending through the rich gravel of the ancient river channel owned by them, which is said to be 3,000 feet long by an average width of 1,000 feet. The tunnel has cost the company nearly $175,000, and occupied over four years' time in its construction. About once a month hereafter a big clean-up may be expected from this work.

Kentucky Rhoe.—We hear this mine well spoken of and should judge it had a bright prospect. Rock from the croppings milled $18 per ton, and when cut by the tunnel, which must be about this time, about 80 feet of backs will be at hand. The mine is on Deer creek, about a mile below Newtown, and being so situated as to be opened by tunnel and the rock worked by water power, has many advantages.

The Union G. & S. M. Co., running a tunnel for the Alta gravel channel, over on Warner's ranch, beyond Alta hill, are progressing favorably with the work. About 200 feet more will, it is expected, bring them to the pay channel, where the reward of all their labor lies. High hopes are entertained by posted ones, of the result of this enterprise.

PLACER.

Coarse Gold.—Dutch Flat *Forum*, Aug. 10: A few days since we were shown a lot of genuine coarse leed gold from the Badger claim; it was taken out from a crevice, overlooked by the parties who drifted here in years gone by. One mouth waters to see the beautiful pumpkin seed shaped pieces of pure yellow gold, just as nature deposited it, and to listen to the miners tell of the enormous amount taken from this and adjoining claims in that way, suggests the reflection, what may not the Cedar Creek company expect when the tunnel reaches the ground that has not been drifted.

Colfax Items.—Although this place is not at present as prosperous as prior to the introduction of the narrow gauge railroad, yet it is a town of no common importance. The quartz mines in its immediate vicinity are being gradually developed, and rock which shows a rich sprinkling of free gold is found in several different ledges. We were shown two specimens by Mr. E. Webster, taken from the Meda ledge, at the depth of 75 feet, which is encouraging if not flattering. The company are now negotiating for the Montana mill, and if they succeed they will soon test the paying qualities of the ledge.

Mining Items.—The Yankee tunnel is being driven with the usual vigor. For the five days preceding Saturday evening the tunnelers worked nine shifts, but owing to some necessary repairs only fired six face shots, advancing 25½ feet. The Baker shaft is being worked by three shifts of men. It is the intention of the superintendent to have this shaft to cradle by the time the Yankee tunnel reaches that point. In order to do so, however, no time is to be lost, for should the tunnel continue to progress at the present rate of speed it will reach that point about the middle of October. The Polar Star claim continues washing. The Elmore Hill and Yankee claims are cleaning up bedrock. The Franklin and Lacamp claims continue washing a few hours each day. The Pacific claim was cleaned up on Monday after a short run, realizing satisfactory returns for the water used. This claim is now hung up for the season. The Southern Cross claim is being rapidly fitted up. The sluices in the tunnel are about completed, and the claim will be ready for washing as soon as the new string of pipe leading thereto is finished. The Indiana Hill claim, at Gold Run, recently fired a blast of about 300 kegs of powder. The powder was placed in drifts, run from the shaft, where the gravel and bed-rock vault. An immense amount of hard cemented gravel was thus loosened up like ashes, and is now ready for successful washing. As a natural consequence, however, the shaft was filled to the surface, but water has been turned on, so the shaft and tunnel will soon be clear again. This claim is procuring the surplus water from the Yuba ditch company, and expect to complete another successful run this season. The Cedar claim, adjoining, is washing. So far Mr. Stone, the energetic superintendent, has only been enabled to wash the poor intermediate gravel, which on this claim is of great depth. It is expected that the present run will clear sufficient space to enable him to reach the bottom and run powder drifts in readiness for next season. All miners in this vicinity are anxious for the result of a run on this bottom gravel, it being the general impression that it will equal anything heretofore reported in the State in proportion to the amount of water used.

PLUMAS.

Green Mountain Mine.—Plumas *National*, Aug. 12: Mr. Charles Rodgers, superintendent of the Green Mountain, which is located above Crescent, called on us Thursday. He says the prospects of the mine are flattering in the extreme. The prospecting tunnels have developed an immense ledge, and the header of the lower tunnel is 800 feet under ground. The rock is "pay rock" in every sense of the word. The new 20-stamp mill will be ready to run in a few weeks, and with the old Dixie mill will give the company 28 stamps to operate with. "Charley" says they have got ten years' pay rock in sight. He seems to think the chance for the quartz mines in all the Greenville section better than ever.

Golden Enterprise.—We had a talk with Mr. Richard Jacks, of Meadow Valley, the other day, regarding his flouring claim, and found him in high spirits—in fact elated with his prospects. His flume has a grade of only 1¾ inches to 12 feet, and it was an open question with the miners—many doubting it—whether it would operate successfully. The past winter has thoroughly demonstrated the practical success of the project, and with plenty of water the flume works like a charm. His main cut is now 720 feet in length, and the head of it—120 feet wide—now shows two feet in depth of blue gravel, which prospects splendidly, and in which Mr. Jacks says it is safe to say that a man could make $10 per day with a pick and shovel. "Uncle Dick" says that he will get a "boot-box full" of gold dust out of the Golden Enterprise, and we are inclined to think he will—hope so, anyway.

A 170 pound boulder, lousy with gold, was recently taken from Gard & Orr's hydraulic claims at La Porte, and it is reported that this company are rolling out the gold in a manner calculated to make the owners happy.

SAN BENTIO.

Strike.—San Benito *Advance*, Aug. 12: A. L. Smith informs us that he saw the rich strike of the Salinas company quicksilver mine on Sunday last. Their ledge connects with the Queen Victoria ledge of the Wonder company. Their tunnel is in about 150 feet, and a solid body of rich antimony and quicksilver a foot thick and of unknown extent is visible.

SIERRA.

Sierra City Items.—Cor. *Mountain Messenger*, Aug. 12: Prospects look a little better up here now, the Keystone has put a small force of men to work, and if they succeed in keeping the water in check with the power machinery they have, there may be a chance for some of the idle men around this camp to obtain work. Ginvollo & Co.'s claim, at Loganville, is doing as well as ever. There are are always eight or ten men at work, and to all appearances the owners get handsome pay out of it, Sam Hartley's celebrated Centennial claim could not do better; last week they took out of it two pieces that weighed respectively 13 and seven ounces. I am almost positive that the two men working there don't average less than $15 per day. J. Beerd & Co. are the extensive of the Centennial are also progressing splendidly, I hope they will soon realize their expectations.

Splendid Ore.—Superintendent Hodge brought several sacks of quartz over from the Kelsey mine last Friday, for shipment to San Francisco. He has driven his new tunnel in to a distance of about 70 feet, when he again cut into the ledge, which at that point is of immense proportions, the full extent of which he has not yet ascertained. We carefully examined many samples of the ore. It is very handsome, beautifully ribbonded, shows free gold and abundantly loaded with fine looking sulphurets. Mr. Hogde, and Seneca Davis, who owns an adjoining claim, are greatly elated, and we make no question but that their sanguine expectations are fully justified.

TRINITY COUNTY.

A Deserted Region.—Trinity *Journal* Aug. 12: Business led us down the Trinity river on Monday, and to one who has seen that portion of the stream lying between Douglas City and the Arkansas Dam in its palmy days, the sight is by no means one of pleasure. Ten years ago this section of the this river spoken of was one of the most thriving and prosperous in the county. At the present time it is almost wholly surrendered to Chinese. Leaving Douglass City, the claims of Wallace and Gruthis can be seen toward the Graveyard Point. They have paid well this winter, notwithstanding the many interruptions occasioned by the big slide back of Douglas City, which kept settling more or less all winter, rendering it a dangerous proceeding to turn water into Tourot's ditch, which runs across it. With the exception of this one claim there is no mining being done in the vicinity of Reading's Bar, the place where gold, was first found in Trinity county. Down this river a little are the claims of Charley Tourot, very deep banks and but little dumpage, but they, too, have paid well considering the difficulty in keeping water upon them. At Buckeye Bar, A. W. Hubbard has found fair prospects on which we understand he intends to put a hand, and we know there is a fine scope of country between Reading's and Brown's creek which will pay splendid if properly worked. At Steiner's, Swift and John Hurst are working, and we have reason to know they are well satisfied with the result of this winters' labor. They are the only white men mining at this once flourishing camp. From this point down, the river is given up to the Chinese who are to be found on every bar though not in such great numbers as formerly. From Douglas City to the Arkansas Dam, a distance of nine or ten miles, but three companies of white miners are at work.

At Evan's Bar, one of the richest on the river, the Chinese who had built out the McGovern claims are going back to the primitive style of mining and have the foundation and frame work up for a large side water wheel. Time was when there were twenty and thirty of these wheels in operation on the river, but at present, so far as we are aware, there are none. Report says the Chinese have struck very rich dirt in the bar, hence the outlay. Evan's Bar was formerly worked by water conveyed across the river by two flumes, which brought Dutch and Maxwell's creeks to the mines. The flumes were swept away by the great flood of 1861; were rebuilt, but a few years ago yielded to the inroads of time and now scarce a vestige of them remain. The Chinese who took out the land have called to obtain the material for the flumes in the successive buildings, and with the increasing expense which would have occurred, their owners did not feel like replacing them. Chinese enterprise will hardly be equal to the task of rebuilding, and the country would be very little benefitted if it should.

TUOLUMNE.

Marka & Darrow.—Tuolumne *Independent*, Aug. 12: This mine is now having a prospecting shaft (No. 6) enlarged for a main hoisting shaft, divided into two compartments, but of sufficient dimensions to make a third compartment at any future time. Beyond this (290 feet to the north), Discovery shaft No. 7, three weeks ago sent some rich ore to San Francisco, which milled nearly $700 per ton. Recently a lot was sent showing no visible color, that by mill process yielded at the rate of $189 30 per ton.

Daniel Hennessy and Patrick King took about $1,000 from a quartz pocket recently, at Sawmill flat. The claim is situated in the hill, back of Mr. Donnegan's old house, where a number of rich strikes have been made by parties at different times.

A Connection.—Union *Democrat*, Aug. 12: We are informed by the managers of the Soulsby mine, in this county, that the statement in regard to the payment of the miners in silver coin is incorrect. They state that under the present management it has been the invariable custom to pay the men in gold, and that silver is only used to pay the fractions of the gold pieces. It is asserted that the company is so punctilious on this point that they have had $1,000 in silver on hand for months, which might have been paid to the men, but which has been withheld in favor of gold.

TULARE.

New Placer Mines.—Cor. Visalia *Delta*, Aug. 10: Now I will sum up by that the diggings look well, but the other side of the picture is: it is a very hard creek to work; boulder strewn upon boulder, and the bed-rock up and down. It is too level for sluicing to advantage. When there is water in the creek it cannot be worked; when there is no water, how can they wash? The only way is to work with rockers, or use dump boxes in connection with sinices, and use those large pumps such as stock men have, and pump the water from the holes on to the dirt in the dump boxes, and wash the dirt in that way. The diggings are wet, and it is hard to prospect on account of water, and no way of draining; but it could be opened with pumps, and once a race opened, perhaps the pumps might be dispensed with. Now I would tell my friends who have large muscle and small employment, that perhaps the mountain air and a trip to Mill creek might do them good, but those who have legitimate business had not better neglect it to "see the elephant." It will be a herd piece to serve the Lord in. I don't want any of it. The miners have met and made laws to govern the workings. Three hundred feet on gulches constitute a claim.

Arizona.

Rich.—Wailapai *Enterprise*, July 29: One ons-half tone of ore from the Laport mine, near town, recently worked $580. Several tons of ors from this mine worked a short time previous panned out $534 per ton. They have on the dump over a tou of the same kind of ore, and six tons of what they call second-class ore, which is worth $300 per ton. It is a blind ledge but has been traced for 1,000 feet, several shafts having been sunk and the ledge shows a uniform thickness.

James F. Reilley has sold to Robert Upton, for the sum of $6,000, a half interest in the Mocking Bird lode, near Stockton, in this district; and John P. Reilly has sold the Laura Shomo, the first south extension on the Mocking Bird, to James Milay. We have not learned the price paid for the latter.

Local Matters.—Arizona *Citizen*, July 29: Another load of provisions was taken to the Trench this week. A new and better furnace has just been built and everything working well. The Ostrich mill company has sent to E. N. Fish & Co. two more pieces of silver weighing 30 pounds evoirdupole—the result of a clean-up of $6,000, a half interest in the Mocking Bird placer gold from Santa Rita this week, and sold the same to E. N. Fish & Co. Herman Welisch and others came from San a Bita this week with various lots of gold. Over 100 people have come into these mines within a short time, and all there are making or can make something. Some rain has fallen in the mines, but much more down the Sonoita valley.

Idaho.

Atlanta Items.—Idaho *Statesman*, Aug. 10: The mining prospects of Alturas are commencing to show up grandly. The amount of ores shipped since the roads have been opened up to travel, is favorably impressing on the minds of capitalists and men of speculation, that there is something in these Alturas mountains that may be invested in with profitable results; the weekly average of snipping ors from these mines to the reduction works is somewhere in the neighborhood of from 10,000 to 15,000 pounds. None shipped less then $300 per ton, and assaying as high as $10,000.

Mining in the Basin.—Owyhee *Avalanch*, Aug. 12: Placer mining has about closed for the season, except some of the claims supplied with water from the main or long ditches. We believe there has been no total failures this season in the placer mines. All seem to be satisfied with the season's operations. Our great trouble is our money all leaves as soon as it is taking out. We are a non-producing people. Nearly everything we consume has to be brought here at a heavy cost for transportation. This is not as it should be, and until the evil is remedied we shall be poor. Our quartz interests are encouraging and the future looks bright for all concerned.

The Ida Ellmore.—The movement looking to future operation in the Ida Ellmore is regarded with hope and favor by all interested in the welfare of the camp. When operations were suspended in this mine several months ago, there was a general feeling of regret, as it was known that the ledge in the vicinity of the 12th level gave promise of the existence of a bonanza that was calculated to make every man interested in this mine feel hopeful for its future. A few weeks labor in removing the water and in prospecting operations would bring the Ellmore to the front again as the key to the situation, and if the gentlemen of San Francisco who are interested in the property will study their interests they will not allow the season to pass without making another effort at development. If honestly worked, there would not be a better paying mine on the Pacific coast.

Oregon.

New Ditch.—Oregon *Sentinel* Aug. 9: Jack Leyton is now having a ditch dug for the purpose of mining Whisky and Farris gulches, in Josephine county. The water will be taken from Williams creek and the ditch is to be 16 miles in length. He expects to have it completed for next season's work.

Foundry Started.—Bedrock *Democrat*, Aug. 2: On last Tuesday morning, M. Hyde, superintendent of the Virtue mine, started up the foundry at our city. The machinery, furnace and every thing connected with this new and useful manufactory worked to a charm. The casting done was of the best. Everyone present, of whom there were several of our citizens, were well pleased with the workings of the Baker City foundry. James King, foreman of the foundry, understands his business and has made a complete success in his management of the workings of this foundry. Those wanting castings can now send in orders and have their work done at short notice, and as good as the best.

Mining Items.—*Oregonian*, July 29: Prospecting for gold, silver, mica, etc., is being done extensively by the people of Jacksonville in the hills and gulches adjacent to that town. Several Chinamen are making from $1 to $2 per day by taking dirt from the streets in Umatilla and washing it through rockers at the river.

Nevada.

WASHOE DISTRICT.

Imperial Con.—Gold Hill *News*, Aug. 10: Daily yield, 30 tons of ore. This ore is being mostly taken from the winze while sinking and the prospecting drifts being run from the winze sunk below the 2000 ft level. The face of the east cross-cut from the winze below the 2000-ft level is again showing some fine ore.

Julia.—The main south drift on the 1600-ft level is steadily advancing, the face still in quartz of a fine character, portions of which give excellent assays. On the 1800 ft level the face of the main south drift is in very favorable ground, with excellent indications of soon finding pay ore. The face of the east drift on the 1800-ft level has cut through a streak of clay, and is just entering what appears to be a fine body of quartz, with every appearance of pay ore. This is no doubt a continuation of the ore vein struck east of the shaft on the 1700 ft level.

Bullion.—Every effort was still being put forth up to last evening to complete the air connection between the winze below the 1400 and the upraise from the 1700-ft level. At that time the men in each shaft could distinctly hear each other's voices through the intervening space, and it was confidently expected that the connection would be made some time to-day.

Alta.—Sinking the shaft is being pushed with all possible energy, four shifts of men of six hours are being employed. It is confidently expected that with this force of men the shaft will be sunk 100 feet deeper per month, a rate of speed unprecedented on the line of the Comstock.

Amazon & Glasgow.—Sinking the joint shaft is going rapidly ahead, the bottom in rock which shows signs of gradually softening, with some indications of water ahead. New and more powerful machinery is now on its way from San Francisco.

Yellow Jacket.—Retimbering the main shaft below the 1030-ft level is finished. Timbering the connecting

(Continued on Page 127.)

(Continued from Page 122.)

far removed from the coast, the iron interest became so fully established that no nation accessible to her ships could successfully engage in the same pursuit, until by following her example its own mines and resources could be fully developed." In 1810 the amount of

Pig Iron Produced in the United States

Was 54,000 tons, in 1828 this had increased to 130,000 tons, in 1842 to 240,000 tons, and in 1870 to the enormous result of 2,052,881 tons, this vast quantity being the product of 3,210,918 tons of iron ore. It may be well for me to add that fully one-half of this was mined in the State of Pennsylvania alone, though large deposits of ore exist in Ohio, New York, Missouri and Michigan; in fact there are no States in the Union, with the exception of Florida, Texas and Louisiana, which do not contribute their quota to this priceless branch of industry. Year by year the yield of iron in the United States, as well as in Europe, is constantly increasing, and from the most reliable statistics at my command, the total product of the year 1874 amounted in round numbers to about 9,000,000 tons, the value of which, taking the average price of pig iron at that time, was not less than $200,000,000. The mind almost staggers under these tremendous figures, and did we not know how universal was the use of this metal, we should hesitate to accept such statements. But the purposes to which it is applied in our social economy are all but infinite, and as civilization advances with giant strides, "iron, more iron" is the cry forever upon her lips, as the grandest need of our progressive path. It is away from my present purpose to talk to you of the

Chemical Composition of Iron.

I would not if I could, and I could not if I would, but it may be well for me to state that iron is never in a state of nature found absolutely pure, but exists in combination with other substances, forming oxides, carbonates, phosphates, silicates and iodides of iron, which are again subdivided into various specific metallic forms and compounds. Probably the richest of all known ores, containing I believe nearly 73 per cent. of pure iron, is that technically known as the black oxide, a variety for which Sweden is especially famous, the metal produced from it being generally esteemed the best in Europe. The mines of Dannemora, in Sweden, have been constantly worked since the 15th century, while large deposits of this variety (known also as magnetic iron) are found in the Ural mountains of Russia, and in this country in Canada, New Jersey, Pennsylvania and Virginia. "The rock formations in which magnetic iron ore occurs contain no coal, hence it is almost always smelted with wood-charcoal, which, as it contains no sulphur, is one great cause of the superiority of the iron produced from it." With regard to the process of smelting, I find in the authority of *Chambers' Cyclopedia*, that "charcoal was constantly used for this purpose up to 1618, when Lord Dudley introduced the use of coal, but the iron-masters being unanimously opposed to the change, Dudley's improvement died with him, and was not re-introduced until 1713, when Abraham Derby employed it in his furnaces at Coalbrook Dale, About 1750 the introduction of coke gave renewed vigor to the iron trade, and then followed in rapid succession those

Improvements in Its Manufacture

Which give to the history of iron all the interest of a romance. The steam engine of Watt, the process of puddling and rolling invented by Henry Cort in 1784, the employment of the hot blast by Neilson of Glasgow in 1830, and the well known Bessemer process of later days, were grand discoveries in this branch of industry, and worthy pioneers of the more extended knowledge of the reduction and utilization of the metal which year by year is made to dawn upon the horizon of mechanical science. Indeed, the energy and intelligence bestowed upon the subject of iron throughout the world, are in themselves sufficient to prove its extreme importance to the race, did not its multifarious uses come hourly beneath our notice and testify to its existence as a necessity of our being. Who can over-value its worth? Who can attempt to sum up the comforts we derive, the blessings we enjoy from a knowledge of

Its Uses and Its Power.

The miles on miles of railways which stretch themselves like a net-work over the surface of our planet, binding continents together in a bond of fellowship, and linking distant nations hand to hand, would have no existence but for iron. The pumps which draw the sparkling water for us from the depths of the earth; the pipes which convey it from distant reservoirs for our cities' use; the fleet of white-winged ships which stud our seas like messengers of love, carrying blessings from one land to another, exchanging the fruits of the earth and cementing the whole world in one compact and universal brotherhood; the grand and complicated machines which attract the attention and move the wonder of mechanical minds; the lofty structures which rise around us on every hand, sublimely reaching up to heaven, as if in meek but earnest praise to the grand creative mind whence all has sprung—attest in trumpet tones the precious boon which iron has been to man, the most important want and blessing of his race. Turn where we will its worth is seen, examine where we may its power and its uses are experienced and known. There is no position in life or rank in society which is independent of its assistance. Not only in those mighty works which assert man's claim to the gratitude of coming ages, but in the minor details of our daily life, in all the countless relations which go to make up the sum and comfort of our being, the value of this marvelous product is enforced upon our attention. The surgeon's instruments, and the bridge which spans a cataract, the dainty needle, and the hammer which can crush a ton, the scythe of the mower, and the lever which can stir a palace, the fearful war guns before whose fire whole armies sink as puppets, and the wire which cages the imprisoned bird, the lighthouses which protect our coast, throwing their beacon lights far across the deep as the wanderer's warning and his sign, and the pen which writes our messages of love, the delicate mechanism which guides the movement of our watch, and the stupendous columns which lift themselves far up into the eternal and bare their brows to God—these are but a few of are varied purposes to which it is applied, and for which it claims our recognition and regard, and let us ever remember that for it

No Substitute Can be Found.

No metal known to us can take the place of iron in its controlling and multifarious uses. For gold, silver, copper, lead or tin, something may be found to supply the place; for iron nothing! It is terrible to contemplate the utter blank which the world would become, if it were possible that by

Some Sudden Convulsion

It could be withdrawn from us, and banished from the earth. As if by the touch of the magician's wand, a desolation, vast and awful, to which the most fearful earthquake that ever devastated the world would be but the falling of a house of cards, the plaything of a child, would come upon us, a desolation so stupendous and so crushing in its immensity as to suggest the day foretold by the prophet, "a day of darkness and of gloominess, a day of cloud and of thick darkness," a desolation which would send our planet with its 1,300,000,000 of souls drifting backwards and ever backwards to her primitive condition, the intelligence of her inhabitants fading with the lapse of the ages, and her surface becoming gradually unfitted for the abode of man.

The mind can hardly realize the change—the paralysis of all endeavor, the destruction of the mighty aids to labor, the uprooting of all social and business institutions, and the total annihilation of commerce in all its forms which would follow such a vast and overwhelming catastrophe! Our grandest edifices would crumble into dust, our noble ships would fade into shapeless masses, and go down rotting to the sea's extremest depths; our telegraph would no longer waft its messages with lightning speed, putting "its girdle round about the earth," our mighty engines which now with almost a living voice proclaim themselves the emperors of force and power, which carry us with such rapidity from place to place, making the once unknown corners of the earth but pleasant visiting spots for a summer tour, would pass forever from our sight—our printing press would cease its holy labor—our fields would become choked with weeds, and the furrows of the plough would be seen no more! The civilization of which we now so worthily boast would have run its course, would lapse into the barbarism out of which it sprung, and

"Like an insubstantial pageant faded,
Leave not a rack behind."

This may be a melancholy picture, but it by no means exaggerates the endless evils we should suffer could the iron of the earth be at once eliminated from its products, and the contemplation of such an appalling wreck should at least help us to be grateful for so powerful an adjunct to our social wants. And looking down the vista of the coming years, do we not with our more interior vision see the possibility of a still wider application to the cravings of a succeeding race than any we have known? Does not the

Daily Growth of the Arts and Sciences

Which occupy man's attention to-day, and the cultivation of which adds hourly to his refinement, and brings his nature nearer to the Divine—does not this suggest the existence of uses for this metal even greater than those we already know, uses as yet but dimly seen even by the speculative and far-seeing mind? Perhaps we are but yet upon the threshold of the temple, and the secrets beyond the vestibule may yet be hidden from our gaze. In the more refined arts of life—in engraving, in photography, in the polishing of various substances, in the cutting of glass and in the structure of ornamental designs our knowledge may be fairly said to be in its infancy, and turning from the peaceful and purifying arts of life to considerations of an opposite character, do we not with a thought perceive how of late years, at least within our present century, iron has been employed by man to meet one of the exigencies of his nature in the construction of those vast and fearful implements of war which are one of the most striking features of our age.

The Iron-Clad Ships,

Which in their present and more perfected form at least, had their origin in America, and which to the number of nearly 400, with the aggregate equipment of over 3,000, are now employed by all the warlike nations of the globe, are due to the existence of iron. The perfect immunity of these vessels to the discharges of cannon in vogue among our fathers suggested heavier artillery, and more powerful guns were needed to penetrate the armor of this mighty fleet. Those of modern times have attained such sizes and such power that we stand aghast at the marvelous amount of ingenuity and constructive genius which men have devoted to the destruction of each other, and wonder if that glorious period spoken of by Tennyson—

"When the war drum throbbed no longer, and the battle flags were furled
In the Parliament of man, the Federation of the world;"

Lives but in a poet's dream.

The Guns Made by Krupp,

Of Prussia, who was one of the pioneers of this branch of industry, challenge our admiration, at the same time that they excite our awe. One of these stupendous weapons, made for the Russian Government in 1868, had a total weight of 50 tons, the diameter of the bore being 14 inches, and the length of the barrel 210 inches. This gun would carry a shot weighing 1,212 pounds, the propulsion of which would require a charge of not less than 115 pounds of powder. The price of this gun, with its carriage and turn-table complete, amounted to $150,000 of our currency, the time occupied in construction being 16 months of unremitting labor. How terrible the expenditure of all this skill and power for the one purpose of destruction! But as in the physical world we see that earthquakes, hurricanes and volcanoes subserve a useful purpose, and prepare the earth for the culture and use of man, so it is held by many thinking and philanthropic minds that with the improvement of our weapons of war the era of peace will more speedily come, that era of which Elihu Burritt, the learned worker in iron, who was "transplanted from the anvil to the editor's chair by the genius of machinery," triumphantly says: "War shall die, and all things that love the face of man and the face of nature; that love to look up in the pure and peaceful sky; that commune with the silent harmonies of the great creation and listen to the music of reasoning things—all these shall fill the heavens with one grand jubilate that the great cannibal is dead." But however this may be, certain it is that through these mighty engines of destruction the strife of nations will no longer be decided in close contact upon the blood-stained deep or on the crowded battle-field. "The sword may not be turned into a plowshare and the spear into a pruning-hook," but the horrors of war will be rendered more short-lived, even if more devastating, and more decisive, if apparently more cruel in their operation, and while we sorrow over the deadly feude which agonize our race, let us remember that the destinies of nations are in wiser hands than ours, and that we in our impotence can but look on, wonder and revere!

I feel that I have already detained you too long, but I must, before I conclude, say a few words as to the existence upon

Our Own Coast

Of the metal we have had under consideration, and the probability of its one day becoming an object for the employment of capital. It may be already known to you that in several portions of this State deposits of iron ore exist, which need only increased enterprise to render them of immense value and importance. In Sierra valley, near Marysville, and near Colfax, large beds of ironstone have been discovered, and when it is known that, according to a statement recently made in the *Mining and Scientific Press*, "the quantity of iron annually used upon this coast cannot be less than 60,000 tons, worth in the rough about $3,000,000, and in a manufactured state not less than $10,000,000," it must be allowed that the development of the iron resources of California and the neighboring States is at least worthy of consideration. In Oregon, some excellent mines, producing ore of the very finest quality, have long been profitably worked, and in British Columbia, a whole island in the Gulf of Georgia, known as Texada island, waits but the energy of a few determined men to give to the world iron ore sufficient to keep employed hundreds of laborers for many decades to come.

The City of San Francisco

Alone has within its limits no less than 47 iron foundries, machine shops and boiler factories, employing upward of 3,000 hands, expending annually for wages not less than $1,000,000, and yet it is safe to say that not more than 2,000 tons of the iron used by these establishments is the product of our own region. It would appear that there is something wrong here, when we consider that the deposit on Texada island, to which I have just alluded, contains on a rough estimate nearly 12,000,000 tons of ore, and that the cry of dear coal and scarcity of wood for the purpose of making charcoal, which may have some weight in California, cannot prevail there, abundance of both coal and wood being close at hand for the purposes of smelting, while nature affords every facility for shipping the result of the enterprise, and carrying it to its markets in other lands. And surely it cannot be deemed Utopian to believe that the day is not far distant when this production of a metal in so general demand all over the world, will become one of the most attractive industries of our coast, and that we may supply our numerous foundries with the

Basis of Their Labor,

Mined and smelted within the limits of our own boundary. At the close of the first century of her independent existence, America has no reason to be abashed at her condition among nations, and when we think that California has hardly completed her first quarter of the same period we may well be proud of the progress which she displays to-day. States, like children, must have time to grow, and expanding into maturity, to shake off the weaknesses of their early growth, and if we are now passing through a stage of fast life, too eager for the sudden acquisition of wealth, and neglectful of the opportunities which lie within the reach of our hands, the day is not far distant in which we shall cast off the too feverish excitement which surrounds us now, and with more sober judgment, and tha experience none the less valuable because purchased in the market of failure, direct our energies and our power to the grandest foundations on which the prosperity of a country can be based, the enlightened cultivation of her soil, and the industrious and intelligent development of her mineral treasures.

The Mechanics' Institute Library.

The Mechanics' Institute of San Francisco was organized March 29th, 1855, and has, like other enterprises of similar character, passed through many vicissitudes before it reached its present standing. Thanks, however, to those who put their shoulders to the wheel at different times, it has now long been established on a substantial basis and in a flourishing condition. In March, 1856, the library consisted of 487 volumes, all told. It now contains upwards of 30,000 volumes. The association procured its own building in 1863, and has since occupied it. The lower floor of the building is occupied by stores, and the upper portions are devoted to the use of the library, reading rooms, etc.

By recent additions of valuable books, the whole second floor is now used for library purposes. The reading room is now on the third floor, one story higher than it should be for comfort, but unavoidable under the circumstances. The library now contains a greater number of books of real practical value than any library west of the Rocky mountains. The recent additions made have been of a substantial character, and in books of reference in particular, the library is rich.

At the time of the last annual report of the President of the Institute, there were on the shelves 27,206 volumes. The number drawn from the library averages 7,840 per month, or 94,080 during the year.

Among the recent valuable additions is a complete set of *Dingler's Polytechnic Journal*, 116 volumes in all; also 218 volumes of *Poggendorf's Annalen*—a work on natural sciences. Another very interesting work for scientific men is that published by the Royal Society of London, which is a catalogue of scientific papers published from 1800 to 1875. This gives a complete list of scientific papers on different subjects, in all languages and all countries, between the dates mentioned, with names of authors, etc.

The most valuable set in the library, probably, is that comprising the British Patent Reports. There are about 3,300 volumes in all, about 250 volumes of which are in large folios. They are bound in half morocco, the expense of binding the whole set in England being $6,735. The set is complete, running back to the earliest dates, and, as the gift of the English government, includes those to be published in the future as well as those already received. A separate room has been set aside for these and the American Patent Reports, access to which is free to all. It was originally when the set of British Patent Reports was presented to the Institute, that they should be free to the public. The Institute is now the official depository of both the American and English Patent Reports.

The value of this set to the mechanic and inventor is beyond calculation. Reference is continually made by our patent office to these reports, and heretofore it has been impossible for our applicants to find out whether the reference really met the case or not. It happens that in a great many cases inventions have originated in England and have been improved upon here in many ways. Accordingly any mechanic or artisan who wishes to follow up the progress of any particular machine must have access to the records of the English patent office to get reliable data. No more valuable works of reference than these could have been provided for the library, and it is a matter of congratulation to the mechanics of San Francisco that they are now able to examine the books at their leisure and free of cost. There are only four other sets in the United States—one at Washington, one at St. Louis, one at Chicago and one at Philadelphia. The Institute now have the whole set, as well as the abridgements and the indices. The indices are very complete, referring to date, subject matter and name of inventor.

It would be, of course, impossible to enumerate more than a few of the valuable books in this large library. Besides the books of reference, the usual books of fiction, travel, general literature and essays, history, poetry and drama, etc., are to be found on the shelves. The association is in a sound condition, the net assets at the time of last meeting being $157,258, the lot and building being estimated at $130,000.

A BLAST FURNACE FALLS IN.—Shortly after midnight on Saturday morning, June 24th, one of two blast furnaces at Swede's ford, below Norristown, on the Schuylkill river, owned and operated by Mr. James Lanigan, fell in while filled with molten iron. The furnace was built about 15 years, and was built of sand-stone. It had been in constant operation lately, and some apprehensions of danger being felt among the workmen when it was filled to an unusual extent, the proprietor thoughtfully ordered that the molten ore be drawn off. While this was going on the accident happened. The loss sustained is estimated to reach $20,000. No one was dangerously hurt, one man being slightly hurt by a stone.—*Iron Age.*

[Continued from page 125.]

drift between the north and east winzes on the 2040-ft level is making good progress and will soon be completed.

Hale & Norcross.—The pumps and columns are in place and the attachments all complete to the surface. The engine is all in complete readiness to start.

Mint.—The shaft has reached a depth of 1200 feet, at which point a station is now being opened. As soon as the station is completed, sinking the shaft will be resumed and the shaft sunk to a depth of two feet before commencing to drift.

Mexican.—The face of the west cross-cut on the 1465-ft level is nearly all in ore, which is steadily improving in quality as the drift progresses westward. The north drift on the same level is showing strong stratums of good ore, dipping steadily to the eastward.

Centennial.—Considerable progress has been made during the past week in grading for building and hoisting works.

Ophir.—Daily yield, 300 tons of ore. The ore breasts are looking well and yielding good ore. The new east ore body on the 1600-ft level is opening up splendidly. It has been opened at three different points on the mill floors, and affords ore that will yield from $100 to $150 per ton. This body of ore was struck after passing through 43 feet of porphyry east of what was supposed to be the principal ore vein. It does not have the broken appearance of the west ore bodies, and has the regular Comstock dip to the eastward, fully supporting the opinion that the vein is again assuming its regular course and dip, having passed the break or upheaval which occurs in it on the levels above. The rich ore in this new discovery is 30 feet in width, and has been struck and is now being opened on in a drift at the bottom of the east winze at the 1650-ft level, where it is fully as strong and rich as on the level above, with every indication of extending downward to the 1700 ft level. The north drift on the 1700-ft level is within 80 feet of the Mexican line, and is showing good ore prospects. The west cross-cut from the north drift on the 1600-ft level, 200 feet south of the Mexican line, is also showing well.

Con. Virginia.—The main shaft has been completed to the 1500 ft level sufficient to admit of supplying the timber for the use of both the Consolidated and the California mines on the lower levels. The ore stopes on both the 1400, 1500 and 1550-ft levels are looking finely as usual. The ore body south on the 1400-ft level is proving much richer than has been expected, and now ore of a rich quality is also being opened northward on the same level. The usual monthly dividend of $2 per share, aggregating $1,080,000, was declared on the 4th inst. The mine, down to the 1550-ft level, never was as well ventilated and in as good condition for the rapid extraction of ore as now.

Lady Washington.—An important and valuable change has taken place in the quartz and ledge matter in the shaft during the week. The shaft is now down a little over 800 feet, the last 200 feet having been sunk the entire distance in ledge matter. At the point where the country rock ceased and the ledge matter set in, a heavy clay wall, with all the characteristics of the Comstock, was encountered. After penetrating this wall a soft species of porphyry mixed with clay slips and occasional stratas of quartz was passed through, which lasted for nearly a distance of 150 feet, when the streaks of quartz became more frequent and the general character much improved. Four days ago the quartz changed to a much firmer and still more favorable description, carrying a large amount of sulphurets of iron, giving favorable assays and bearing the general appearance of antimonial silver ores. This body of quartz still continues in the bottom of the shaft, pitching at an angle of 45 degrees to the eastward, and bears the appearance of being a genuine portion of the Comstock. If the quality of ore continues to improve for the next 50 feet as it has through the past 50 feet, the Lady Washington will, without doubt, open up a paying mine.

California.—Daily yield, 700 tons of ore, keeping the mills steadily running. The yield of bullion for the month of July was $2,062,000, and will not be far from the same amount for August. The ore stopes, wherever they have been opened on the 1500 and 1600-ft levels, are showing just as richly as ever. Beyond this there are no changes to report of the mine. The usual monthly dividend of $2 per share, aggregating $1,080,000, was declared on the 8th inst., and the mine never looked as prosperous in the past as it does today. The pumping machinery of the C. & C. shaft is working splendidly, and sinking the shaft has been resumed. The new stamp mill is about completed, and will be ready to steam up by Sunday next. It will then take some three or four days to turn down the pulleys and regulate the machinery, when everything will be in readiness to commence crushing ore. This mill will add a crushing capacity of 300 tons to that already now in use, which will increase the amount of ore extracted and crushed to about 1,000 tons per day, and the yield to nearly or quite $3,000,000 per month.

Justice.—Daily yield, 75 tons of ore, keeping the mills steadily running. The ore breasts and stopes show a steady improvement. The east cross-cuts on the 800-ft level are showing finely; in fact the general appearance of the mine exhibits a gradual improvement in almost every quarter.

Sierra Nevada.—Opening the 1700-ft station in the shaft is going steadily forward and soon be completed.

Belcher.—Daily yield, 300 tons of ore. The erection of the new pumping machinery is being finished as fast as the nature of such work will permit. The hoisting engines are used daily in lowering the immense pumps and pump columns into place.

Crown Point.—Sinking the main incline is making excellent progress, notwithstanding the extreme hardness of the rock. The main south drift on the 1700-ft level is being steadily pushed ahead to connect with the bottom of the Belcher air shaft, the face still in a fine character of quartz. This quartz is all low-grade ore, but none of it will pay the expense of extraction and milling.

Superior.—Owing to a necessity for some repairs to the boilers the sinking was suspended during the greater part of the week. During the time the sinking was stopped the water rose nearly 100 feet in the shaft. Last evening, however, the water had been drained.

Gould & Curry.—The old machinery has been taken out and the heavy stone foundations are being put in place for the reception of the new and powerful pumping machinery soon to be erected.

Savage.—The old pumps are being taken out, the shaft repaired, and the new one put in as rapidly as such work can be done well. The engine and other machinery is all ready to start up as soon as the pumps are in.

North Con. Virginia.—The new pump bob is in place. The engine is on its bed, and the erection of the entire machinery is being forwarded at as rapid a rate as such work can be done consistent with its durability and completeness.

Ward.—Sinking the shaft is making the same excellent progress as heretofore. It is now down 425 feet, the bottom in good sinking ground.

Caledonia.—The rock in the bottom of the shaft is of the hardest, toughest character possible, it being difficult for the best of workmen to sink over a foot a day.

Prospect.—The drift at the 400-ft level is in 18 feet, and is now being enlarged for a station. When this station is properly opened out, sinking the shaft will be resumed.

Utah.—Sinking the main shaft is going steadily forward 25 feet per week.

Silver Hill.—Sinking the main incline is progressing at the rate of 2½ feet per day. Driving the north drift on the 444-ft level is making progress at the rate of 25 to 30 feet per week.

Union Con.—The face of the north drift on the 1300-ft level has greatly improved during the past week. The drift from the bottom of the winze below the 1300-ft level is also showing a much better quality of quartz and ledge matter.

West Belcher.—The two up-raises to connect with the ore body are making good progress. The mine is being steadily opened.

Nevada.—Face of main drift west, cross-cutting through the ledge in solid quartz, or low grade ore, which shows improvement.

Leviathan.—The north drift on the 600-ft level is steadily advancing along the west wall of the ledge, the face in good running ground. Occasional streaks of quartz and ore are encountered, affording a very favorable prospect.

Baltimore and American Flat.—Sinking the main incline is making good progress, considering the amount of water to contend with.

Chollar Potosi.—Daily yield, 100 tons of ore, keeping the mills steadily running.

Sutro Tunnel.—Excellent advancement is now being made, the face of the header being in easy working porphyry, soft limestone and clay. Total length of tunnel this morning, 13,900 feet.

East Justice.—Sinking the shaft is being energetically pushed ahead.

Florida.—Material in the face of the north drift works easy. Good assays continue to be given by the stringers of quartz coming in.

Herald.—The ore vein in the bottom of the main shaft, although not so wide as it was supposed to be, is still strong and the ore of a very rich character.

Best & Belcher.—Repairing the drifts and winzes on the 1700-ft level and getting ready for steady and active cross-cutting operations.

Buckeye.—Driving the north and south prospecting drifts on the 550-ft level, with very favorable prospects.

Mitchell.—Bottom of winze continues in very favorable vein matter, streaks of which assay well.

Useful Information.

On Packing Flowers.

The following practical suggestions on packing flowers for transportation by mail are condensed from an article on the subject in the London *Florist:* Always cut the flowers early, in the cool of the morning, and when in their prime. Take a piece of cotton-wool, wet it and wring it out, and twist it about the stalks. If tin boxes are used they must not have sharp corners, or they will be rejected at the post-office, but when properly made they excel all others for the purpose in question. At the bottom of one of these place a piece of stout brown paper (if thin, double it); let this be well dampened, then lay the flowers carefully in, placing a piece of silver or tissue paper between each to prevent their bruising each other. Over all place a piece of the same paper, and on this a little cotton-wool. Cover the box with paper, and the flowers will reach their destination in good condition.

Let us add the modes of faulty packing to warn our friends against their adoption: 1. Placing the flowers in contact with dry cotton-wool, which clings to them and abstracts their moisture. 2. Putting them in thin boxes which invariably get crushed in passing through the post-office. 3. Putting the cotton-wool about them too wet, the moisture from which gets shaken over the flowers, and spoils their colors. 4. Cutting the flowers after exposure to the sun, which ensures their falling to pieces on the journey; this also occurs if the blooms are stale.

Some persons in sending flowers think it best to cut them when not fully open, knowing that they will expand in water; but they should learn they do not show their true character either in shape or color under such circumstances. A better plan is to cut off the pistil as soon as it can be done; this will insure the flower lasting a considerable time.

Nickeling Small Articles.—Many unsuccessful attempts have been made to nickel small articles by boiling, just as pins, hooks and eyes, etc., are silvered or tinned. A Nuremberg chemist named Dr. Kayser, has succeeded in coating metals with an alloy resembling German silver, thus giving them a handsome finish, and making the surface more durable and permanent than that of tin or silver. He first melts together one part copper and five parts pure tin—preferably the Australian, which has recently come into commerce, almost absolutely pure, yet cheaper than Banca tin. The alloy is granulated as usual, but not too fine, and then mixed with water and tartar, as free from lime as possible, into paste. To each 200 parts of the granulated alloy is added one part of nickel oxide of nickel, and the articles are laid in it. After boiling a short time they become beautifully silvered. Some fresh oxide of nickel must, of course, be added from time to time. Brass and copper articles can easily be silvered in this manner without previous preparation; those of iron must first be copper plated. By adding some carbonate of nickel to the above bath, or to a common white bath, and boiling, a coating richer in nickel is obtained, and darker, varying in color from that of platinum to a blue black, according to the amount of nickel salt added.

Lightning and Petroleum. — Lightning plays sad havoc with the oil interest of Pennsylvania. The following is a statement, in barrels, of the oil destroyed by lightning since April 12th, 1876: Parker, April 12th, 46,000; Sligo, April 13th, 1,000; Oil City, June 3d, 44,000; Petrolia, June 8th, 300; Petroleum Center, June 13th, 300; Bradford, June 13th, 25,000; Troutman, June 17th, 3,000; Fairview, June 26th, 24,000; Rynd Farm, July 2d, 200; Pittsburg, July 9th, 12,000; Millerstown, July 11th, 22,975; Pittsburg, July 12th, 7,500; Beaver City, July 12th, 1,200; Dilk Station, July 20th, 64,869; minor fires, 4,000. Total, 256,354.

On railway car axles, 20 pints of oil lubricate eight journals of care for 5,000 miles, or one pint for 250 miles.

Varnish for Paper.—An elastic flexible varnish for paper, which may be applied without previously sizing the article, may be prepared as follows: Crush transparent and clear pieces of dammar into small grains; introduce a convenient quantity—say 10 grains—into a flask, pour on it about six ounces of acetone, and expose the whole to a moderate temperature for about two weeks, frequently shaking. At the end of this time pour off the clear saturated solution of dammar in acetone, and add, to every four parts of varnish, three parts of rather dense collodion; the two solutions are mixed by agitation, the resulting liquid allowed to settle, and preserved in well filled phials. This varnish is applied by means of a soft beaver hair pencil, in vertical lines. At the first application it will appear as if the surface of the paper were covered with a thin white skin. As soon, however, as the varnish has become dry it presents a clear shining surface. It should be applied in two or three layers. The varnish retains its gloss under all conditions of weather, and remains elastic; the latter quality adapts it especially to topographical crayon drawings and maps, as well as to photographs.

Facts About Machines.—Velocity of circular saws at periphery, 6,000 to 7,000 feet per minute. Rate of feed for circular saws, 15 to 60 feet per minute. Velocity of hand saws, 3,500 feet per minute. Velocity of gang saws, 20-inch stroke, 120 strokes per minute. Velocity of scroll saws, 600 to 800 strokes per minute. Velocity of planing machine cutters at periphery, 1,000 to 6,000 feet per minute. Travel of work under planing machine 1-20 of an inch for each cut. Travel of molding machine cutters, 3,500 to 4,000 feet per minute. Travel of squaring up machine cutters, 7,000 to 8,000 feet per minute. Speed of wood carving drills, 5,000 revolutions per minute. Speed of machine augers, 1¼ inches diameter, 900 revolutions per minute. Speed of machine augers, ¾ inch diameter, 1,200 revolutions per minute. Gang saws require, for 45 superficial feet of pine per hour, one horse power indicated. Circular saws, for 75 superficial feet of pine per hour, one horse power indicated. In oak or hard wood, three-quarters of the above quantities require one horse power indicated.

To Test the Strength of Vinegar.—The strength of vinegar is determined by the number of grains of bicarbonate of soda a troy ounce will completely neutralize. For instance, to test the strength of vinegar, weigh out one ounce, then find how many grains of bicarbonate of soda the vinegar will neutralize or dissolve. If thirty grains are neutralized, the vinegar is said to be thirty grains strength. To test the purity of the vinegar, pour out half a wine-glassful and add ten or twelve drops of the solution of muriate of barytes. If the vinegar is pure it will show no change. If it contains acid it will gradually turn to a milky hue, according to the quantity of acid it contains.

Estimating the Value of Coal.—In an exchange we read the following conception of the display of coal from the Cape of Good Hope, at the Centennial: The display of fuels, though occupying but little space, is entertaining and instructive, for quite a variety of coals are exhibited, each accompanied by its coke and ash. To us this means of exhibiting fuels is remarkably appropriate, and is worthy of imitation; for by an examination of the physical properties of coals, their cokes and the resultant ash, an intelligent opinion of the commercial value of the fuel can be formed.

Good Health.

Personal Care of Health.

A manual of health issued by the "Society for Promoting Christian Knowledge," (an English organization), contains many very valuable hints, some of which are given herewith to our readers. This volume is the last literary labor of the lamented Dr. Parkes, and is one of the most useful of the many useful books the society alluded to has yet published.

Dr. Parkes regards the diseases so widely spread among us to a great extent self inflicted, and even those which we are powerless to prevent often controllable by man. By legislative enactment very much has been done in providing pure air, pure water, and food free from deleterious adulterations, to ameliorate the conditions of city and village residents. But legislation cannot deal with those conditions which belong to the individual. Amelioration here can be the result only of an intelligent understanding of the laws of life and health. The frightful difference between the infant mortality of the rich and the poor is chargeable chiefly to the ignorance and carelessness of the latter. If by any means the masses can be taught the simple and almost self-evident laws of health, the rate of mortality among children would decline and approximate to the rate which is found in healthy districts.

The critical period in the life of men and women Dr. Parkes places between the ages of 14 and 21. During that period not only is the mental character formed and developed, but also the physical constitution on which so much of the after life depends. Strength and activity of body may be cultivated or neglected, while the mental character, though it may to a certain extent be influenced by the training of earlier years, is mainly developed and determined by personal action. During this period eight hours, and preferably nine of the 24 should be devoted to sleep. Of the remainder, three to four might be occupied with meals and rest during the day, and the others should be given up to exercise, equally divided between mental and physical, but in such a manner that the two kinds of exercise are alternated. Two hours of real study is quite sufficient at a time for the growing brain. Young women ought to be physically trained as carefully as men. They ought to have strong, firm muscles, and be well developed. Five or six hours of daily exercise, involving real bodily labor, is not too much for even "young ladies." Much of the exercise which is taken by young people is of too violent a character to be of any permanent benefit. What is wanted is a steady, progressive cultivation of the muscles, such as is attained by walking, running, rowing, swimming, when those exercises are carried on quietly, and without the strain which too often occurs in their daily practice. Young people should never feel that they have a stomach; they should eat when hungry till hunger is gone, and should feel neither weight nor uneasiness, nor sleepiness after meals. Nitrogen enters into the construction of every nerve, every muscle of the body. Both the animal and vegetable kingdoms supply nitrogenous foods which man can use, and with any of which he can attain his highest bodily and mental development. Where pecuniary circumstances permit it is best to let meat supply a considerable portion of the nitrogen required; but the laboring man, by ringing the changes on oatmeal, maize, peas, beans, rice, and macaroni, to which may be added occasionally cheese and bacon, may bring up his children as well nourished as those of the richest people at a small cost. As to drink, young men and women are strongly advised to abstain from alcohol, for it is certain that it does harm to the growing body; and with regard to persons of adult years, the uncertainty which prevails as to the value of alcohol turns the scale in favor of total abstinence instead of moderate drinking. Dr. Parkes is decidedly in favor of early marriages—seeing, as he has, that much ill-health among both sexes would have been prevented by the occupations and even by the cares of married life.

Grapes as Food.

We have on former occasions, says the *Journal of Chemistry*, referred to the value of fruits as articles of diet, both in health and in sickness. Grapes may deservedly claim a high rank among the fruits in this respect. They contain a considerable amount of hydrocarbonaceous matter, together with potassium salts, a combination which does not tend to irritate, but on the contrary to soothe the stomach, and which is consequently used with advantage even in dyspepsia. According to Dr. Harteen, of Cannes, in France, who has recently contributed an article on the subject to a foreign medical journal, the organic acids in the grape, especially tartaric acid, deserve more consideration than they have generally received. Their nutritive value has, he thinks, been much underrated. It is known that they are changed to carbonic acid in the blood, and possibly careful research may show that they are convertible into fats. Dr. Hartsen thinks that they should be ranked with the carbo-hydrates as food. They have been found a valuable diet in fever, and the success of the "grape cures" in the Tyrol and other parts of Europe appears to show that they are positively beneficial in other diseases. No doubt the good results of a residence at these establishments are in a measure to be ascribed to the climate and the general hygienic discipline adopted. The advantage does not wholly consist in the fact that so many pounds of grapes are eaten daily, but partly in the fact that other less healthful things are *not* eaten; and pure air and exercise are also important elements in the curative treatment. But after giving all due weight to these allied influences we must allow no small fraction of the beneficial result to the grapes.

Bodily Weight and Nutrition.—Professor C. Voit in a lecture at the Public Health Congress held at Munich, remarked: "The weight of the body has often been assumed as no infallible proof of the maintenance of the condition of the body, or of a deposition of tissue, and the food which keeps up a man's weight has been regarded as on that account satisfactorily nutritious. But the weight of the body is no criterion of the value of the food taken, because while the weight remains constant, or even increases, water may increase in the tissues and albumen and fat diminish; or there may be an increase of weight and deposition of fat while there is also at the same time a diminution of the albumen of the body. Badly nourished people are usually not lighter than others, but their bodies contain more water and less albumen and fat than those who are well nourished. Every cattle feeder knows that cattle which are being fattened do not at first increase in weight proportionately to the food they take. And yet people commonly regard weight as of great importance in the case of men, though a butcher will not buy a carcass on the merits of its weight alone. He must know the quality of the meat. The subjective feeling of satisfaction is equally deceptive. The Irish peasant who consumes 10 pounds of potatoes in the day feels quite satisfied, and yet is badly nourished. The bad effects of an improper dietary are often seen only after a considerable period has elapsed."

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Why Not; The Golden State Rotary Pressure Blower; Facts About Peat, 121. Hard Times Among Miners; The Eleventh Industrial Exhibition; Notices of Recent Patents; Comstock Papers, 128-9. Mechanical Ore Concentration and Separation; The Centennial at Philadelphia, 129-132. Mines About Carson; Patents and Inventions, 132.

ILLUSTRATIONS.—Rotary Pressure Blower, 121. Diagram of Agricultural Building, 129.

CORRESPONDENCE.—Alpine County—Its Mines and Resources, Past, Present and Future, 122.

MECHANICAL PROGRESS.—How to Hang a Grindstone; Taste in Chandelier Making; How Large Metal Coils are Made; Using Steam Boilers; An Axle to Each Wheel; An Ice Box, 123.

SCIENTIFIC PROGRESS.—The Preservation of Timber; Lightning in Steam; Meidinger's Battery; Electrical Conversation; Magnetism in Steel; Technical School at Rouen; Force Exerted by Growing Plants; Amber; Large Solar Plants, 123.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 124.

MINING SUMMARY from various counties in California, Nevada, Oregon, Idaho and Arizona, 125-127.

USEFUL INFORMATION.—On Packing Flowers; Nickeling Small Articles; Lightning and Petroleum; Varnish for Paper; Facts About Machines; To Test the Strength of Vinegar; Estimating the Value of Coal, 127.

GOOD HEALTH.—Personal Care of Health; Grapes as Food; Bodily Weight and Nutrition, 127.

GENERAL NEWS.—General news items and Miscellaneous Paragraphs, on 132 and other pages.

MISCELLANEOUS ARTICLES.—Iron and its Relations to Civilization, 122-126. The Mechanics' Institute Library; A Blast Furnace Falls In, 126.

NEW ADVERTISEMENTS.

Paul's Dry Process, Almarin B. Paul, S. F.; Mariposa Land and Mining Co.—Sale; Antilles Mining Co.—Sale; Mariposa South Mining Co.—Assessment; Tintic Milling and Mining Co.—Meeting.

"A PRACTICAL TREATISE ON TESTING AND WORKING SILVER ORES."—The work under this title, by Chas. H. Aaron, published by Dewey & Co., will be ready for sale in a few days. No work of equal interest to practical miners has yet been issued. Although a small volume, it contains hundreds of practical hints which are available in every-day work to those miners who have not unlimited capital at their command, as it describes so many simple things to take the place of costly ones. The processes referred to are described in a clear and unmistakable manner, and in an easily comprehensive style. We shall in our next issue give a more extended notice of Mr. Aaron's work, which will give an idea of its contents to contemplative purchasers.

OLD MINES IN THE BLACK HILLS.—The *Deadwood Pioneer* says: On claim No. 12, Cape Horn district, 14 feet below the surface, in a boulder weighing about 3,000 pounds, was found a perfectly drilled hole, proving conclusively that mining has been done in this locality at some previous day, and it is not unreasonable to suppose that the party who came to the hills some forty years since and were never heard of afterward, were the same who mined some in this locality and met their death at the hands of Indians at the cave, where bullet-marks on the trees are plainly visible to this day.

THERE was a terrific rainstorm in Elgin county, Canada, on Saturday, with immense destruction of roads, bridges and crops. Twelve bridges were swept away in a radius of three miles. The streams were never known so high. Pails, etc., exposed to the weather, were found to contain seven inches of water.

NOTICE is hereby given that J. M. McArthur is no longer agent for this paper in Arizona or any other sections. The paper will be sent to all who have subscribed through him previous to this notice.

Hard Times Among Miners.

Although times are not so flush among the miners on this coast as usual, and, perhaps, more of them are out of employment than has been the case for a long time, they have little to complain of compared with their brethren in other parts of the world. Wages here remain at their usual standard, and, although, in one or two instances attempts have recently been made to reduce them, they have not been successful in any case. The only fault to find now, is that in many of the large camps the force of miners has been reduced, and those thrown out of work have found it difficult to find employment, as most of the local papers in the different camps contain frequent warnings for men not to come there, as there are more men than there is work for. It is to be hoped that this state of things will not last long, and that a fresh revival of interest in mining will return with the increase in value of silver.

All over the United States and England a bad state of affairs exists in its mining community. In the middle and northern coal fields of Pennsylvania, the situation is very bad, and is becoming worse every day. There never was a time in the history of coal production in which labor was so poorly paid as now. In many parts of the middle fields last month, skilled miners averaged about $12 during the working period, and the same was the case in other parts of the coal regions, and how they have managed to keep the wolf away from the door is difficult to imagine. Those who have been unemployed have suffered severely, and instances of actual starvation are recorded in the Wyoming and Lackawanna regions. Cases have come to the knowledge of the authorities of families subsisting for several days upon the flesh of domestic animals that have been butchered.

The mining and transportation companies have been fighting amongst themselves, and an extended suspension of operations has been the result. It is said that the general suspension which occurred on the 8th inst. threw 30,000 miners and laborers out of employment. The colliers are still struggling against the schemes of the monopolists and the oppressive "company store" system, for it must be understood that the companies not only cut the wages of the employees, but they also force them to buy at the stores owned and managed by them; and very frequently a miner, after he receives his "hook" from the "company store," has nothing left. The combined impositions of the great coal ring—particularly the continued suspensions—while heavy and increasing prices are demanded from wholesalers, retailers and consumers, are exciting the colliers, and serious trouble is apprehended at the close of the month. Many persons who testified in the recent Molly Maguire trials have received "coffin notices," cautioning them to quit the region within a specified time, and there is proof that the murderous spirit of the terrible organization has not yet been crushed. What the end of all this will be of course no one can tell, but it is greatly to be hoped that operations will again be resumed shortly and the men given employment.

It is stated that the effect of the great depression in the mines of Cornwall, England, has been to reduce not only the working miners, but the small shop-keepers in the mining districts, to the borders of starvation, and all who can raise money by any means are emigrating. The working-men are leaving the country by hundreds, and leaving the women, children, old and infirm to be supported by the parishes. It is reported that in one parish alone there are 500 women and children thus left. Groups of emigrants can be seen almost daily at the railway stations on the Cornwall and West Cornwall lines. This is more or less the case all over England. It will be seen from what we have said, that, although the times may be considered hard among the miners on this coast, they are nothing like so bad as elsewhere.

The Eleventh Industrial Exhibition.

The Mechanics' fair is now in full running order and the attendance continues to be quite large. Our home industries are all pretty well represented with the exception of machinery, which department does not make the showing it should. There are, however, a number of interesting articles in this department, one of which is described on our first page. We give also on another page considerable space to the oration of Henry Edwards, Esq., delivered at the opening exercises. The subject is "Iron and its Relation to Civilization." It will amply repay perusal to even those to whom the subject is familiar.

The displays made at the fair this year are characterized by being somewhat more elaborate than usual, and with the decorations of the building, combine to make a spectacle of excellent general effect. The display of agricultural machinery by different firms makes an attractive feature. So also does the exhibit of the different carriage and furniture manufacturers. The latter in particular shows both taste and skill in our artizans. The manufacturers of glassware, woodenware, rope, pottery, etc., etc., all make creditable displays in their lines. We shall, during the continuance of the fair, take occasion to mention in detail those things which have the merit of novelty or superiority.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

IMPROVED BOILER.—A. J. Stevens, Sacramento. Mr. Stevens' invention consists in the employment, in return tubular boilers, of two chambers situated one above the other, and at some point between the ends of the boiler, so that four fine sheets are provided for receiving the tube and flues which are thus made correspondingly shorter, while the elasticity of these sheets allows for the difference of expansion and contraction between the tubes and the shell of the boiler much better than when the flues extend the full length, and thus reduces the danger of breaking the flues off at the point where they are secured to the sheets. The chambers give more room and time for the combustion of gases and a larger amount of heating surface, while by connecting the upper and lower chambers by short tubes flame is allowed to pass from the lower to the upper one so as to ignite and keep up the combustion of the gases which have passed through to the back connection and returned to this point. A further advantage of Mr. Stevens' arrangement is that he is enabled to make the flues and tubes in four sets, less than half the usual length, and with a correspondingly less contraction and expansion by heating and cooling. The walls of the chambers receiving the ends of the tubes in the same manner as the flue sheets, provide an elastic support at each end of each set of flues, which will easily compensate for the difference of expansion and contraction which takes place between the tubes and the shell of the boiler, and the inventor is thus enabled to entirely prevent the breaking of the tubes at the neck or point where they are secured to the sheets, a common difficulty where flues extend the full length of the boiler.

ORE FURNACE.—Henry H. Eames, Oakland. The patent covers certain improvements in that class of furnaces for roasting fine or pulverized ore, in which a series of horizontal shelves or partitions are placed at intervals one above another, inside of an upright stack or shaft, and in which the ore is caused to drop from one shelf or partition to another by arms or sweeps attached to an upright rotating shaft. The chief feature of the invention relates to a novel arrangement for supplying a constant stream of cold water through a hollow shaft, one end of which is permanently closed so as to terminate inside of the furnace. Such a shaft is used for carrying the arms or sweeps in the class of furnaces above mentioned, of which the furnace described in the letters patent, No. 152,943, issued to Eames and Walbridge, July 14, 1874, is a sample. When a simple iron shaft is used for this purpose the intense heat to which a portion of it is subjected causes it to warp and soon become useless. It is therefore necessary to devise some means for keeping the shaft cool when the furnace is in operation, in order to work the furnace successfully. If the shaft passed entirely through the furnace it could be made hollow, and a stream of cold water passed through as has frequently been done heretofore, but as it terminates inside of the furnace a special device is necessary for cooling it. This is done by Mr. Eames by extending the water pipe into the hollow shaft from the outside of the furnace, until its extremity is close to the closed bottom of the hollow shaft. The stream of water will then be discharged into the bottom or closed end of the shaft and will flow back through the annular space between the two pipes to the outside, where it is discharged. The invention also relates to an improved device for protecting the shaft and its arms or sweeps from the corroding action of the fumes of sulphur, which are generated in the furnace; including also an improved device for securing the arms or sweeps upon the shaft; and an improved arrangement for feeding the fine ore to the furnace so as to render its operation continuous.

FAIR LEADER.—James Sampson, S. F. This invention relates to certain improvements in that class of devices known as fair leaders for running rigging in vessels, and it consists in so constructing the leader that while the inventor retains a block containing a number of leading holes or openings through which ropes from different parts of the rigging may be led to the proper points, he is still enabled to reduce it materially in size and secure it to a shroud without its being in any way clumsy.

KITCHEN ACCOMMODATION CHEST.—George McIntyre, S. F. This is an improved kitchen chest or cabinet, which is not only useful for holding articles used in cooking, but which is also provided with drawers and shelves for containing napkins, towels, cutlery, and other articles used in kitchens or dining-rooms. It contains a bread board, flour bin, dough box, salt box, etc.

ABOUT fifty English miners arrived at New York on Sunday in the *City of Chester*, from mining districts in Westmoreland and Cornwall, England. They leave for Virginia City, under contract with some English mine owners.

A SCHOOL is to be established in the Black hills.

Comstock Papers.

NO. 4.

Mineral Wealth of Western Utah—Early Traditions and Opinions on the Subject—First Silver Ore Found in '49.

It is an error to suppose that the discovery of silver mines east of the Sierra Nevada was to the people of California wholly a surprise. Antecedent to that event, many people in this State had, for various reasons, entertained the idea that deposits of this metal existed in the expanse of country laid down on the early maps as the Great American desert, and latterly known as the Utah basin. First, the region lay contiguous to, and, following the trend of the great mountain chains, directly in the path of the silver producing belts of Mexico. Then there were Spanish legends ascribing to it a great wealth of this kind, stories of successful expeditions thither in search of the precious metals having come down to us from former times. Many intelligent persons, more especially those conversant with Mexican history, cherished the belief that important discoveries would some day be made off that way. Among this number was Judge James M. Crane, an early settler in California, but who, impressed with this opinion, passed over the mountains in 1857, and took up his abode at Genoa, then the principal town in Western Utah, to represent which section he was afterwards chosen delegate to Congress. Crane, who had made himself familiar with the mining chronicles of Northern Mexico, was an enthusiast on the subject, and after traveling much over Western Utah, now the State of Nevada, predicted that it would soon become conspicuous for its production of the precious metals, and even outrank California in this respect. As this was before the discovery of the Comstock lode, the expression of this opinion may be supposed to have been due to some mental prevision of these after events. What was then foretold has already come to pass; the gray deserts of Nevada produce to-day more than twice as much bullion as the "Golden State."

The venerable pioneer and eminently good man,

Peter Lassen,

When crossing the Black Rock country, in northwestern Nevada, observed there such signs of silver bearing lodes as induced him to return in 1858 and prospect that region, and but for his untimely death at the hands of the Indians, while out on that expedition, it is probable enough that he would have attained the object of his search.

Nor was the existence of the precious metals in these desert lands to the east a mere matter of opinion or conjecture founded on traditious and theories alone. The survivors of the immigrant party, so many of whom perished in Death valley in the fall of 1849, while making their way over the mountains into California, found and brought with them some pieces of very rich silver ore. So rich, in fact, was this ore that it attracted the attention of all who saw it and led to many parties going afterwards to search for the place where it was found. Associating the locality with the scene of these immigrants' sufferings, the most of these parties sought for it in the vicinity of Death valley, going, as recent experience has shown, much too far east. Last year some miners prospecting in the Coso mountains, Inyo county, came upon the exact spot where this ore was obtained, its identity being established by the most ample and unmistakable proofs. It is situated in what is now known as the Lee district, the ledges from which this rich ore was broken off being at present owned by the Emigrant company, who are working them with capital results. The finding of this rich ore by these immigrants ante-dates the discovery of the Comstock lode nearly ten years, during all which time the attention of prospectors and explorers was more or less occupied with the subject of mineral discoveries off in that direction.

Brewing of the Washoe Excitement.

With the public mind this somewhat prepared for an event of the kind, it is not at all strange that a large number of Californians were ready to credit the report and to take their departure for the "Eastern Slope," the name by which this trans-Alpine region had come to be known immediately upon the announcement being made of this rich metaliferous find over there. Only the year before many thousand miners had precipitately left the State for British Columbia, but meeting with only disappointment there, the greater portion of them had already returned to their old haunts. Once on the wing, however, the most of these men remained uneasy and ready for a new flight should anything occur to set them in motion. Being in this condition of industrial disorder and mental unrest, the discovery of these silver mines opened to this class a new and inviting El Dorado, the evidences of whose wealth rested not, as in the case of Frasier river, upon dubious rumors and the statements of interested parties, but on the more substantial proofs of ore shipments and bars of bullion.

As already stated, Judge Walsh had before the end of 1859 brought to San Francisco, ore that yielded nearly $120,000 worth of gold and silver. In addition to this other parties had shipped to the city some small lots of rich ore,

and as there had been a considerable number uf arrastras kept ranniug at the miues, with some gold dnst gathered from the placers, the total bollion product of these Washoe mines for the year mnst have exceeded $200,000; the whule of it produced with a comparatively small outlay of labor, and in the course of ahout six muath's working time. There was no gainsayiug this sort of evidence. Here were ocular and tangible proofs such as any reasoaable mind would accept as conclusively establishing the great valae of the mines. Sach, at least, was ths views that the mssses were pleased to take of the matter, and by the time that winter had set in these facts, growing as they spread, had become widely disseminated throughout the State, creating a great excitement amoag all classes, aad inspiring multitudes everywhere with the purpose uf aa early emigration to a region that promised an easily gaiaed fortnne to all, and the opening up to capital aad enterprise of a new aad profitableindastry. Alresdy, thea, by the end of the year there had been laid the foandation for a miniag stampede of more formidable proportions than aay that had preceded it, the movement having been partially restraiaed for two or three months uatil the snow had settled on the Sierra Nevada, these mountaias, before the constrnction of wagon roads over them, having been difficalt of passage during the winter.

Meantime, the adventurers whu had already gathered on the

"Easlern Slope"

Had not beea idle. Before the winter set ia, though it commenced that year with much rigor, on the 2d of November, these wide-awake and active men had taken up every thiag in the shape of qaartz croppings along and adjacent to the line of the main lodo. The surrounding coantry for a distance of fifty miles or more had been prospected aad many new miaing districts laid ont, ia each one of whioh a great many company claims had been located and upon some of the latter mnch work had been done. Foreseeiug the urgeat necessity that wonld soon arise for the employmeat of propulsive power the waters of the Carson river had for many miles been claimed for this purpose. All the more available creeks, spriags, wood aad farming lands had been taken up, the latter having in maay iastances been sarveyed and partially secured by enclosure or other improvements. Some water driven arrastras had been put np aloag the Carson, and steps taken for the construction of moro exteasive and efficient reduction works at the miaes. Virginia City had been laid ont and several substantial stoae buildiags, with a much larger number of wood, canvas or other temporary structnres, erected on the spot. The hamlet at Gold Hill had doubled its size, while Carson City, which the summer before had drawn to it most of the basiness from the old Mormon town of Genoa, had grown from some half dozen houses into a good sized village. Namerous town sites had been selected at other snpposed eligible points, npon all of which cities of magnificent proportions had been projected. Notwithstanding the difficulties aad great cost of transportatiou over the monatains several traders were able to sh ow very respectable stocks of goods, and not had the following winter proved to be one of nnnsual severity, there wonld have been provisioas enongh in the country to have subsisted the popnlation until spriag with comfort. As it was, maay were forced to forego the ase of most of their accustomed lnxuries at the table, not a few haviag been content before the winter was over to accept for ratioas a short allowance of beans and bacon.

It might prove interesting to the public of today to say something here of the history of this Washoe country, prior to the period of which we are now speaking, when it was as yet occapied by an almost evenly divided population of Mormons or Gentiles, whose religious aad social differences lead to animosities that made these remote aad secluded valleys the scenes of perpetual turmoil and strife, converting them not nnfrequently into the theatres of fearfol tragedies and revolting crimes, and we should feel inclined to devote a chapter to the narration of these strange and little known events, did not this involve such a wide departure from the original purpose of these papers as to forbid the nadertaking.

Unemployed Men in New York.—The New York *Herald* says: Our nnemployed workmen number not fewer than forty thousand, and it is only natural there should be mntteringa of discontent and portents of a terrible fntnre. What is the worst featnre of this problem is the fact that the suffering and agitation come at a time when retrenchment is absolutely necessary. While municipal bankrnptcy would result from inaugurating public works merely to fill so many mouths, it ought to be known that the Department of Public Works employs barely five hundred men, while the salaried officials annually take about eleven millions of dollars ont of the city treasury.

Mining Superintendent.—In onr advertising columns will be fonnd the card of Mr. E. B. Smith, miniag superintendent. Mr. Smith has been for many years connected with mining enterprises on this coast, and for some time past has been engaged in Mexico. He has had great experience, particularly with the "Sonora process," so-called, with which he has been very snccessful on what are termed rebellious ores. An opportnnity ia here offered to thoee who need one, to secure the services of an experienced and intelligent man as superintendent, competent to open or work mines, construct mills, etc.

[Copyrighted.]

Mechanical Ore Concentration and Separation.—No. 4.

(Written for the Press by Francis F. M. Cazin, M. E., Santa Fe, New Mexico.)

Specific Gravity the Principle Qually Acted Upon for the Mechanical Separation of Minerals.

The specific gravity of a miaeral is its weight compared with that of some substance, taken as a standard. For solids and liquids, *distilled* water uf 60° Fahrenheit, is the standard ordinarily used; and if a miaeral weighs twice as much as water its specifio gravity is two; if three times, it is three. It is then necessary to compare tho weight of the mineral with the weight of an equal bulk of water.

The Process

Is as follows: First weigh a fragment of the miaeral in the ordinary way, with a delicate pair of scales; next saspend the mineral by a hair or fiber uf silk to une of the scales, immerse it thus suspended in a tambler of water, (keepiag the scales clear of water), aad weigh it again; sabtract the second weight from the first, to ascertain the loss by immersion, and divide the first by the difference obtained; the resnlt is the specific gravity. The loss by immersion is equal to the weight of the same bulk of water as the mineral.

Another and better, because more simple method than the above for determining the specific gravity, and which will be sufficient for all mineral dressing purposes, becanse applicable to porous material also, is the following:

Select a glass vessel of not too large a size, an d fill it with di.tilled water. The correct weight of the vessel empty and of the distilled water in it must be determined, and a mark should be made of the surface line of the water, best on a narrow neck of the vessel. Take out from the vessel, best by sucking through a glass pipe, a portion of the water, mark the lower surface now on the narrow neck again and weigh the entire vessel again so as to ascertain the difference of weight, or the weight of the water taken from the vessel between the two marks on the narrow neck of the vessel.

Reduce some of the mineral, whose specific gravity is to be determined, to powder, and ponr as much of it in the water as will make the surface of the water rise to the first and upper mark. The powder shonld be weighed in total, and the remaining part after the required quantity be submerged in the water, in order to ascertain the difference in the weight of the powder, snbmerged. Divide the weight of the powder submerged by the weight of water whose place it took (between the two marks) and the resnlt (quotient) is the specifio gravity sought for.

The United Sons of Vulcan and the Heaters' and Rollers' Assooiation have been merged in the National Amalgamated Assooiation of Iron and Steel Workers, comprising all the iron and steel-makers in the United States and Canada, and formed for their protection in strikes.

The Centennial at Philadelphia.—No. 11.

We give herewith a ground plan view of the great exhibitiun building of the farmers, known as

Agricultural Hall.

Last to be completed, but chief in importance to all is this great hall of the farmers. From the delay in the commeacement of the structure, the idea got abroad that the farmers were to be igaored in this grand exposition of our Centennial progress; that they were tu be crowded into some corner uf one of the other buildiugs, and not brought prominently forward as a distiactive class. We have no evidence, however, that such was the inteat, yet the idea, beyond a doubt, had the effect to detract much from the enthusiasm which, had their eventaal position been fully understood at the start, would have animated the farmers of the country. In the early months of preparation, appeals were made for the farmers to help on the graad project; but the reply went back that they were promised no exhibition building, aotwithstaading the fact that they represented a majority of the real wealth of the coantry, aad out-nnmbered ia popnlation all other indnstries combined. There is ao

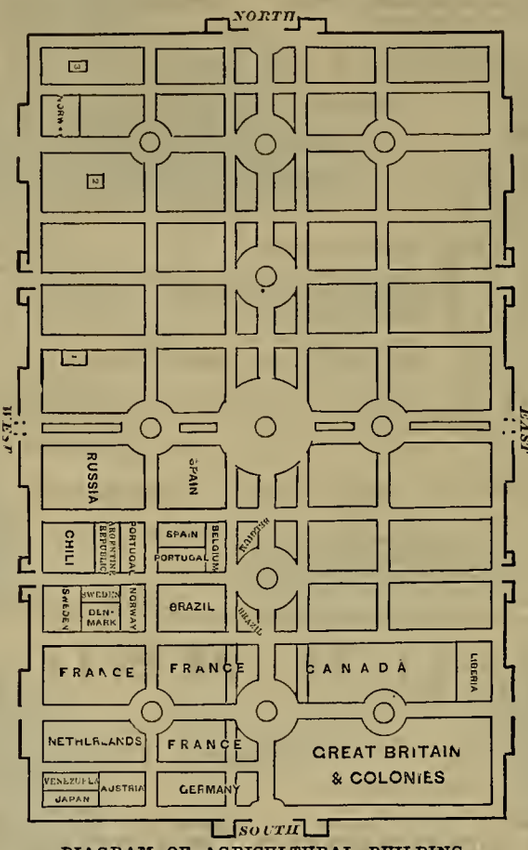

DIAGRAM OF AGRICULTURAL BUILDING.

doubt bat the commissioners did an nnwise thing in putting off to the last the construction of an agricultural building; and then in placing it on the most distant portion of the grounds, and finally in so limiting it in size that two or three important annexes have had to be added to accommodate exhibitors in that department. This combination of circumstances has caused this really most important feature of onr American international exhibition to appear as a matter of merely third-rate importance; and the wonder is that so creditable an exhibition has been made. The building appears, to one looking at it from a distanoe, as a mass of green roofs, scarcely distingnishable from the green hills above and beyond.

It consists of a nave 826 feet long by 100 wide, oro sed by three transepts, each 472 feet long and 80 and 100 feet wide. The spaces between the transepts and nave and at the corners is roofed over, so that the interior presents an enclosed and covered area, 826 feet long by 465 wide—about 10 acres—with vistas broken at intervals by the tall, timber bases of high pointed arches which rise to the hight of 30 feet or more. Overhead and above these colnmns the eye rests upon a bewildering network of trusses and beams, where bnt little ornamentation has beeu attempted, and where whitewash has been employed instead of paint to cover the nakedness of the work and throw light npon the exhibits below. The principal archway which covere the nave rises to the hight of 75 feet.

What is to be Seen Here.

Within this struotnre are exhibited, or were intended to be exhibited, all the processes of agricultural machinery and the prodacts of the farm, the orchard, the garden and the sea. Snch was the intention; but the narrow limits of the building have crowded the great interest of cheese makiag iato one "annex," and the still greater interest of pomology into another. With a proper management and an earlier annouacement of iateations in this direction, the farmers of the United States, and those from other lands, would have filled to its ntmost capacity, a building equal in area to that of the main building—21 instead of 10 acres.

With all its short-comings, however, this department of the exhibition may be considered one uf its most interesting and important featares. Never before has such an exhibition of all that pertains to agriculture been made. The United States occupies considerably over one-half of the entire space. Twenty-two foreign nationalities are represented, and the relative proportions of space which they occupy may be readily learned by refereace to the accompanyiag diagram. No Americaa can help feeling proud of his cuantry while passing through the aisles of agricaltnral hall. No other oae coaatry on earth could make such a display uf the industries that feed the world as is there shown by onr people. With the exception of the Caaadian exhibit, two ur three graia separators from Fraace and a portable engine or two, neither Eagland nor any other country has sent us an agricaltural implement to place in competition with onr own. The Caaadian exhibition is decidedly creditable, most unexpected aad yet most welcome; bnt it is scarcely in any sense of the word a foreign exhibit. The Canadians have takea all their lessons in agricaltnral machinery from the United States; nothing from England. They have learned the absardity of bnildiag heavy, and an American in passing from the United States into the Canadian department, which immediately adjoias, would never suspect he had crossed the border were he not reminded of the fact by the labels which accompaay the varions exhibits.

English Regrets.

The Eaglish appear to regret that they have been so negligent in seading over their machiaery, and are earnest in their tirades against our system of protection as the canse of such neglect—they could not have sold their machiaes here if they had bronght them. But the presence here, later in the day, uf nnmerous representatives from other conntries, where no protective tariff exists, aad the fact that snch persons have come here to examiae and parohase was a possibility that onr English cousins had not thoaght of—and heace their regrets, but too late. It is now becoming evident that onr agricaltnral implement makers will reap a rich harvest from the varions coantries of South and Central America, India and some other foreign conatries. Indeed such a trade has already commeaced. Brazil and Paragnay, in particnlar, are leaviag numerous orders, and a gentleman who owns some 12,000 acres in the Argentine Republic, has said that he shall bay largely, and American machines only. These two adjoining and growiag countries are entering extensively into improved farmiag, and it is quite evident that an immense trade in this line mnst spring up from that quarter in the early fnture. This is oaly one of the many evidences of the vast impetus which this exhibition mnst give to our trade abroad ia manufactured articles.

The English, of course, are making great efforts to contest this foreign trade with our mannfacturers. They are not at all inclined to yield the palm of excellence, and, failing ia this are very anxions to seonre a recogaition of the superiority of their work in some other direction, when they *do* exhibit. They are also industrious and earnest in proclaiming their superiority in agricultural machinery—particularly in plowe, mowing machines and harvesters. They claim that at a recent competitive trial before the Royal agricaltnral society, at Tannton, in Somersetshire, England, the American mowing machiaes did not compare favorably with the English; the same claim is set np for threshers. But our Yankee farmers and those from the Southern portion of this contiaent, as well, seem inclined to take all such representations with many grains of salt, especially in view of the opportunity which has been here presented to repeat and verify such experimental trials. The English general claim is that their work exceeds ours in solidity, strength and durability. Their Caaadian brethren, judging from their exhibits, and they are an eminently practical people, and one which still venerate the "mother oonntry," do not appear to see it in that light.

French Rejoicing.

The French, who, by the way, are equally earnest advocates for free trade with the English, seem to take a sort of quiet pleasure in this nnexpected disoomfiture of "perfidious Albion." In reference thereto they say: "Look at her exhibit. See, she is as surely losing her pre-eminence over the industries of the world as her power among the nations, and her hopes for the future are being sadly interfered with by the progress of the 'Great Republic.' The time is fast approaching when her power and prestige will disappear beneath the very ocean over which she has so long held supreme control." However nnjust such implications of decay against England may be, in fact there can be no donbt but there is a quiet but strong nndercurrent of feeling, among the French, in favor of the United States at the expense of England. The situation is becoming so apparent that Englishmen are beginniag to avoid the subject with a "yes—but" and sudden change of conversation to some other topic.

A General View.

Entering the building by the south or main entrance, we find, as in the other two build-

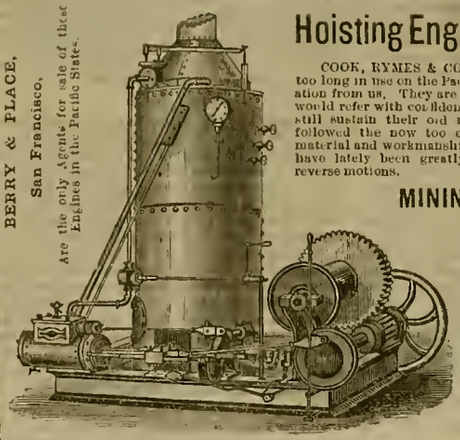
BERRY & PLACE,

San Francisco,

Are the only Agents for sale of these Engines in the Pacific State.



Hoisting Engines. Mining Engines.

COOK, RYMES & CO.'S celebrated Hoisting Engines have been too long in use on the Pacific coast to require any special recommendation from us. They are well known from Alaska to Mexico. We would refer with confidence to any one of the hundreds in use. They still sustain their old reputation, the manufacturers not having followed the now too common practice of reducing the quality of material and workmanship to compete with cheaper engines. They have lately been greatly improved by adding large drums, and reverse motions.

MINING HOISTING ENGINES.

(Manufactured by the same parties.)

Our new Mining Engine is built from plans and specifications of several of our MOST SUCCESSFUL MINING ENGINEERS, and the result is the most complete

Double Drum Hoisting Engine

Ever built. Their advantages will be seen at a glance by any one familiar with the necessities of a mine. These engines may be seen in use in Ophir, Con. Virginia, Chollar, Europa, Niagara, Leviathan, Phil Sheridan, and several other mines on the Comstock Lode. For sale only at

BERRY & PLACE,

(Succesors to Treadwell & Co.)

San Francisco Pioneer Screen Works,

J. W QUICK, MANUFACTURER,

32 Fremont Street, San Francisco.

Several first premiums received for quartz mill Screens, and perforated sheet metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 426 California street, Room 1.

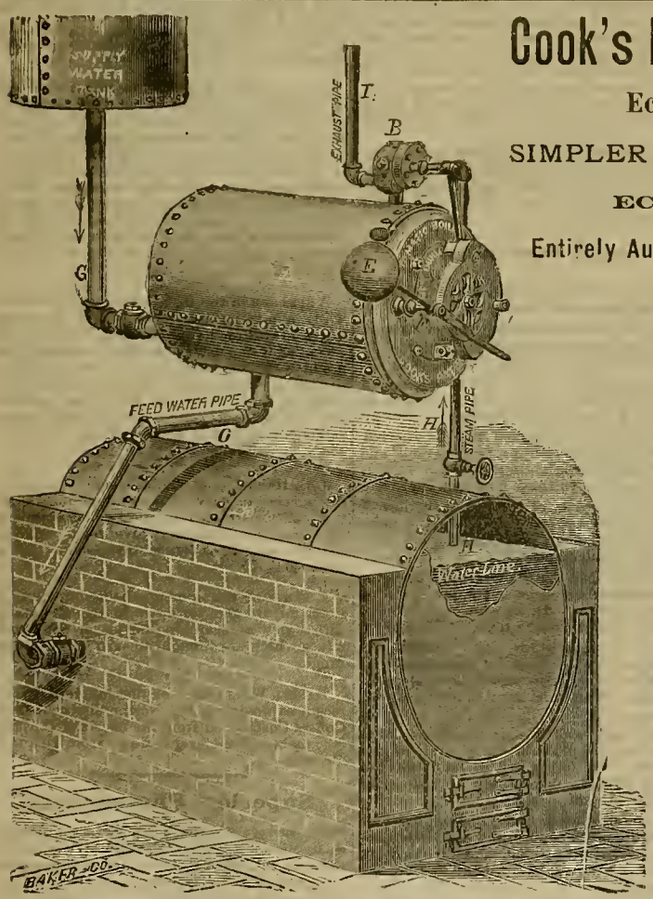
Cook's Patent Automatic Boiler Feeder & Regulator.

Economy in Operation. Absolute Safety from Explosion.

SIMPLER THAN A PUMP, AS IT REQUIRES NO ATTENTION.

ECONOMY IN FUEL.

Entirely Automatic, Reliable & Durable.



Cook's Automatic Boiler Feeders

WERE AWARDED THE HIGHEST PREMIUM OVER ALL MACHINES EXHIBITED AS BOILER FEEDERS AT THE CINCINNATI EXPOSITION AND THE ST. LOUIS FAIR.

The cuts show the operation of the Feeder. It was described in detail in the MINING AND SCIENTIFIC PRESS of May 20, 1876.

This Feeder will discharge from 40 to 200 gallons of water at one movement, where a pump would require hundreds of strokes to do the same work.

The water is kept exactly at the proper line, whether running fast or slow, without attention from the engineer.

Feeders, Heaters and Regulators Combined are made on this principle. Simple and economical.

The control of feeding water to the boiler is taken out of the hands of the engineer and left to unerring natural laws.

These Machines are now introduced on this coast for the first time, although they are extensively used in the Eastern States. They supply the boilers with great regularity, and keep the water at exactly the same level. As a protection against explosion they are simply perfect, leaving nothing to be desired.

ONE OF THESE FEEDERS CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS.

Address,

For Circulars and Further information,

SAN FRANCISCO.

[Continued from page 129.]

ings already noticed, fhe foremosf place assigned to foreign exhibitors—Great Britain and her oolonies upon our right as we euter, Germany and Francs upon our left. Pasoing up throngh the main avenue and reaching the center of the structnre, which is occupied by a large fonntain, you are in position to get the best general view of the entire exhibit. Yet it is so large in dimensions, and so divided info puzzling sections, that it is necessary to exercise a vast deal of care and patience as well ae perseverauce in order to fully satisfy the cnriosity of the first preliminary visit, and so learn the eituation of things ae to enter npon a careful examination and etudy at subsequent onee. Near fhie central poeition is a fnll size, old-fashioned wiudmill, for grinding wheaf aud corn, whose broad arme, reaching from floor to ceiling, seem to have braved the wiud and weather for fhe entire century whose history and progrese is spread out before us. Thie is a central point, vieible from nearly every part of the bnilding, and which will serve as a guide for your future wanderinge. Standing by its side and facing fhe east—see the diagram—yon have before you, upou fhe righf and left, a perfect wilderness of all kinds of machinery and implemente adapted for nse on the farm. This display occupies nearly one-half of the enfire area, and motive power is furnished to puf in motion all snch as require to he thus shown.

The Machinery on Exhibition.

We have before ns upwards of thirfy threshers. Thie, if will be recollected, was one of the first agricultnral machines put in use, and originated in Scotland towards the cloee of ths last century. The reaping machine followed close upon ifs heels. To-day the eye may wander among fully one hundred of theee machines, some of them fiuished ae beautifnlly as pieces of jewelry, with roeewood frames and metalic parts glisteuing with bnrnished silver plate. Plows are here in almost endless number and variety of form and make. About three hundred are shown—stubble and sod, prairie aud ridging, gang and snlky, mole and ditching, etc. Some "too handeome to be puf in fhe ground," and others old and ancient enongh in appearance, to have been left in the field by Cinciunatus himself. One shines forth in all the glory of burnished golden plate, and another near by, raised high npon an extemporized pedesfal, presents about as rough and uncouth an appearance as could well be wrought out of iron and wood. This plow is said to have been mostly constructed by Daniel Webster, at his old Marshfield farm. The marks of the hammer, evidently wielded by au unaccustomed hand, as if shaped the iron, are still visible, while it is quite evident a hatchet or drawing knife were the finest fools which put the finish upon the woodwork. This plow beare the date of 1837, and measures thirteen feet in length, with great awkward handles six feet long, and a spread of fully three feet. From the fronf of the point to the back of the 20-inch mold-board the distance is five feef fonr inches! Then we have cultivators and harrowe, forks and rakee, rollers and drills, corn planters and potato planters, and potato diggere in almost endless profnsion. Every conceivable iuvention designed to lighten the labor of man in tilling the ground, and harvesting snd handling its crops, is here represented. The display of such edge tools as axes, scythes, sickles, corn and hay knives, straw cutters, etc , etc., is also in proportion.

Eleven Stntes are exhibitors of machinery and tools, and their displays reflect the highest credif npon American inventive genins and skill. With the few minor exceptions already noticed, no foreign names appear upon the hundreds of wonderful machines that are here displayed. They have been nearly all iuvented by American brains, and form a proud exhibit to the nations of the world of what this great people has done duriug the first century of its exietence as a nation. "All aloug the line," iu fhe various exhibite of old and new, we may trace the gradual but steady advancement in the manufactnre of machinery for the farm. No function in agricultnre eeeme to have been overlooked; no difficnlty hae heeu enconntered which hae not been tiinmphantly overcome. Here it is that the progressive farmers of the land delight fo congregate. If is in agricultural hall, before all other places on the Centennial grounds, where the American feels moet fully at home, most completely maeter of the situatiou. He ie there before a congregated world, foremost in all the improvements which lay at the foundation of every human indnstry, which are inspired by the desire to save the toil of man in his most laborious effors to feed the inhabitante of the earth by fhe cultivatiou of its millions of acres. It is here that the eharere in thie toil assemble in great nnmbere, largely moved by n mutual, fraternal understanding, which ie a mystery fo those of other industries, and thoee who are accustomed to the constrained manners and ways of the more conventional life in citiee and towns.

There is no Formality Hers,

No introduction or ceremony ie needed to bring visitore from distsnt parts together in social intercourse and mutual study aud admiratiou of things aronud them. Each becomes at once acquainted with the other, showing that there is in every deed "much humauity in all mankiud." Each talks easily and well, not only of the reapers, and threshere and mowers, and the various products of the earth and sea by which they are surrounded, but also of the various topios of the day, the literature and politics of the country, and the literature and polifics of the varions foreign nafionalfies, with the representatives of which they are here thrown in contact. All this gives evidence of progress in something else than mafters of mere material interest. With the introduction of machinery on the farm, and fhe substitution of steam and horse power for human muscle, the farmer has gsined more time for thoughf and study. Business associations, with which he was formerly unacqnainted, and new and enlarged social relations and privilegee have grown np during the time in which the reaper and mower have been puehing out and away the sickle and the scythe. The school and the farm have become more closely nnited. The Grange, too, hae come in with ite noble, elevating and hnmanitarian influenoes, and is gafhering up our now better educated young ladies and young men of the farm, and fittiug them for the practical duties of improved social life, and the high responeibilities of citizens of a republic. The farmers are rapidly being elevated from the least to the most intelligent and active among the industrial classee of the counfry, and by reason of their larger numbere and improved status they will eoon become the controlling power of the land. At no fime or place has this epirit and fact of progress been more fully developed than at this preeenf international gathering. The moet casual observer, if he observes at all, mnst notice if. It etands prominently out, af all times, in this great farmers' hall; it is still more apparent in that other great farmers' headquarters, the Grange encampment, near by. This exhibifion is a greaf school, where object lessons are being taught on a magnificent scale—and no clase may derive more beuefit therefrom than the farmers. Every tiller of the soil who can spare the time and money ehould take advantage of it. It is the opportunify not of a lifefime merely, but of a century. No one can visit the Cenfennial without learning more in regard to all the greet facte of life than could be obtained by any other means at the same cost of time and money. W. B. E.

Mines about Carson.

[By onr own Correspondent.—No. 5.]

Carson City.

The capifal of fhe State of Nsvada, now lays claim to abouf 5,000 inhabitants. Situated on a level plain; her streefs laid out at right angles, and lined with a fine growth of coftonwoods with here and there a Lombardy poplar, quaking aspen, locust, balm of Gilead, and other shade and ornamental treee, she appears to great advantage in compariaon with Virginia City nnd neighboring places not so highly favored.

She stands, in fact, wifhout a rival in the State, unless an excepfion be made in favor of Reno or Truckee mead ow—a belle, by the way, of no ordinary beauty. Her public buildings are numeroue, some of them large and generally well constructed, embracing the State capifol, the penitentiary, fhe State orphan's home, and the United States branch mint. In addition fo some sixty individuals, incinding abont twenty femnles, who are receiviug employment at the mint, there are upwards of one hnndred engaged ns foundrymen, patternmakers, machinists aud car manufactnrers in the different workshops of fhe V. & T. R. R., located here. It was nof my intention to dwell so much upou the present conditiou of the city as upon her future prospects.

I must confess to a feeling of surprise at finding the commnnity so generally hopeful in regard to the

Mines around Carson.

The expectafion of soon resping a rich harvest from fhis quarter, wae not confined to the proepecfor and mere speculator, but seemed to pervade the breasts of some of the moet substantial merchants and business men of the place.

My information wae gleaned from various sources, from leading citizene, and in eome instances from individuals having no direct pecuniary interests at stake.

Ahout a year ago, a ledge was discovered eomething over three miles south of Carsou, and a location made. The claim has since passed into fhe hands of the Ayres & Hopkins S. M. Co., office, San Francisco. The work thus far is an an open cut into the monntain side, some thirty feet in depth, by fifteen feet in width, disclosing a magnificent vein four feet wide, containiug bromide, chloride, sulphurets, aud almost every other description of silver ore, together with eome rich gold-bearing quartz. It is looked npou here as a most remarkable discovery, some experts estimating its average at $500. Four huudred tone now on dump, believed to exceed that amount. Arrangements are now being made, if not nlready perfected, with Eastern capitalists to immediately pnt up hoistiug works, and a mill of snfficient cnpacity to work the ore to advantage. The Loretto, All Right, Ayres Consolidated, and many other extensions, eome teu to fifteeu in all, have been located on the ledge aud duly incorporated in your city.

The Niagara.

Two miles west of the oity, in King's canyon, ie opened hy shaft seventy feet, and a oross-cut of thirty feet, showing a very wide lode. Assays made at the mint run from $15 fo $85 per ton. I understand fhat Professor Stewart, of Virginia City, had exsmined the lode and pronounced it a frue fissure vein, and that, while somewhat broken up near the snrface, had expressed the opinion that all it required to make it a valuable property, was a sufficient depth.

The Houston, in the ssme neighborhood, is opened by shatt and tunnel and is said to show free gold, the absence of Mr. Brown, the superintendent, will account to some extent for the meagerness as to detail, and want of definiteness as to facte pertaining to the mine.

The Black Ledge and Besset Mine,

Sifuated four or five miles uorfhwest of Carson, located and opeued nine years ago. It was re-located two yeare eince, and work has bsen commenced in earnesf. Messrs. Besset & Pippin, the owners, are now erecting a five-stamp mill, and as it ie an enormoue ledge of over two hundred feet in width, and assaying all the way from $3.33 in silver, up to $1,600, they go to work with a vim. It has been thoroughly prospected, and they have run one tunnel a distance of 1,300 feet, which only requires an exteneion of abont two hnudred feet more fo tap the ledge at a depth of 1,200 feet from fhe surface. I olose with the

North Carson.

The company is incorporafed in San Francisco. Mr. J. Q. Ayres, president, and Mr. A. S. Gould, euperintendent. The mine is located two and a half miles north and overlooking the city. At fhe preeent depfh, near two hnudred and seventy feet, if shows a solid body of ore—a fine white qnarfz—full five feef in width, resembling almost, beyond possibility of distinguishing, the best ore of the Beloher (ns I was informed), with one and a half foot clay walls. From the fwo hundred to the two hundred and fiffy foot level, it ie said, to increase rapidly in size and metal bearing quality, the present assays being about $40 per ton. The company are sinking a new compartment, main shaft, timbering both compartments 10x10 sets.

The New Steam Hoisting Works

Started up more than a monfh ago, the first in Ormsby county, and is working admirably. It is nnderstood thaf fhe company contemplate building a twenty-stamp mill shortly, as a body of ore is reported on the oue hundred foot level over one hundred and twenty feet along the line of drift, assaying as high as $220 per ton, and thonght to average in the neighborhood of $50. The whole expenses for nine months, including machinery, have not exceeded thirty cents per share on the capital stock of 100,000 shares.

If one-half fhe statements here made in regard fo the minee are true (aud some of my informants declared that fhey had rather nnderratsd than otherwise). Carson City may "fake conrage and look np." K.

General News Items.

The Senafe has confirmed the nomination of A. M. Clapp as public printer.

The big explocion in making the excavation at Hell Gate, will take place Sepfember 5th, and 65,000 ponnds of powder will be nsed.

A Vienna dispatch says: Part of the crown jewele of Servia have been sent to Vienna as seourify for a loan of 62,000 florins.

The President hae signed the Legislative, Executive and Judicial appropriation bill and the Indian appropriation hill. All the regular annnal appropriations have now been approved.

William Rulofson, of the firm of Bradley & Rulofsou of this city, has been chosen president of the national photographers' association, now in seseion at Philadelphia.

Palisade G. M. Co.—Aug. 14th. Location: Tuolumne county, Cal. Capital stock, $5,000,000. Directors—C. J. Pilshury, J. R. Kendal, L. W. Mix, F. Homer and A. P. Crocker.

Rex Mortis M. Co.—Aug 16th. Location: Inyo county. Capital stock, $320,000. Directors—J. H. Holt, W. H. Raymond, T. J. P. Lacy, D. Henshaw Ward and Z. S. Spaulding.

Volcano Basin Tunnel Water & M. Co.—Ang. 16th. Location: Amador county. Capital stock, $10,000,000. Directors—Thos. Sorosis, G. W. McNear, R. M. Burdeck, J. W. Moyle and W. C. Flint.

Nash Deep Gravel M. Co.—Aug. 16th. Capital stock, $10,000,000. Directors—S. B. Martin, J. L. Barstow, M. M. Englieh snd S. C. Nssh.

Steptoe Con. M. Co.—Ang. 16th. Capital stock, $10,000,000. Directors—J. D. Wheeler, G. Lawa, Robt. Briggs, Myron Angel and J. J. Holmes.

Silver bullion is advancing in price steadily in London. It ie also stated that Germany's supply of silver destined for sale is not large. According fo late telegrams, the idea of introducing a gold currency in India in lieu of silver is opposed, and it is stated further, thaf grent inconvenience is resulting from the change which has been made in Germany. A special from London, dated the 15th inet., saye the eilver market is bare. If there were any there it would have probably brought fifty-six pence as against fifty-two a few daye before.

A speaker in the British House of Commons while admitfing that the aspeot of the silver question justified apprehension, believed that except as to the extent that the American minee might yield increaeed amounts, we now kuow the woret. The idea of introdncing gold cnrrency in India in lieu of silvsr was opposed, and the epeaker mentionsd the great inoonvenience which had resulted from the change made in Germany.

J. S. Hanna is at Galioe creek, Oregon, for the purpose of surveying a mining ditch which is to be coostrncted by the English company. The proposed ditch will give them sufficient water to work their claims throughout fhe entire year.

A party of young men is being organized in Portland, Oregon, for a trip to the mountains, with a view of searching for placer and qnartz mines which are thonght to exist in the Caecade range.

Daniel Walls, one of the sufferers by the recent explosion in the Norfonville coal mine, Contra Costa, died from the effeote of it August 8th, making the eleventh death from that terrible casualty.

Superior Photographs.

To be sura of a good picture, you have only to patronize G. D. Morse's Palaca of Art, st No. 417 Montgomery street, S. F. Tha publishers of this journal have patronized Mr. Morse for many years, and do not heaitate to say that his pictures are not excelled hy any wa have seen produced in this or any other country. No one can ask for a hetter man to patronize than Mr. Morse. He is affabla and respectful to all.

Woodland, Cal., Aug. 8th, 1876.

Messns. Dewey & Co.—*Gents:* Your letter containing the patent for my Centennial churn has coma duly to hand, and you will please accept my many thenks for the prompt manner in which yon attended to the bnsiness intrusted to your care, and I will take great pleasure in recommending you to anyone having anything to attend to in your line. I am having a number of the churns put up, which will he ready for sale in a few weeks. Yours truly, James Root.

Brimstone and Treacle, and Milk and Sulphnr, are administered on every change of season in familica in the old countries to fortify children against attacks of eruptive fevers. Ahlutions with Glenn's Sulphur Soap supply an armor no disease can penetrate. Sold everywhere.

Any Person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that tha paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

DEWEY & CO.,

PATENT AGENTS

Office—224 Sansome Street, San Francisco

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interference Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

DEWEY & CO., Patent Solicitors,
San Francisco, 1876.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

"Faith and Confidence"

LIVERMORE, Oct. 1st, 1875.

MESSRS. DEWEY & Co., Patent Solicitors: *Gentlemen*—Yours of the 29th ult, containing my patent to Elevated R. R. duly received, and I hereby return my sincere thanks to the MINING AND SCIENTIFIC PRESS Patent Agency for your promptness and honesty in regard to our business connections. I have received a flood of circulars from Eastern firms, desiring to deal with me, but I have declined any communication with them and prefer, as soon as circumstances will permit, to negotiate with and patronize a home institution; one in which I have faith and confidence—DEWEY & Co.

Again thanking you for your promptness in securing my patent, I remain, obediently yours,

WM. H. HARRISON.

THANKS, ETC.—*Messrs. Dewey & Co.—Gents:* I write to acknowledge the receipt of letters patent on my fruit drier, which came to hand to-day. Accept my thanks for the very satisfactory and successful manner in which this case has been handled.

Respectfully yours, HILAND O. HULBURN.

Placerville, July 20th, 1876.

And in accordance with law, and an order of the Board of Directors, made on the seventh day of July, 1876, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the company's office, on Friday, the eighth day of September, 1876, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. M. MORGAN, Secretary.

Office, 207 Sansome street (third floor), San Francisco, Cal.

Office South Comstock Gold and Silver Mining Company.

NOTICE.—The annual meeting of the stockholders of the South Comstock Gold and Silver Mining Company, for the election of trustees and the transaction of such other business as may be presented, will be held on Monday, the 21st day of August, 1876, at two o'clock P. M., of that day, at the office of the company. Transfer books will be closed on Wednesday, August 16th, 1876, at three o'clock P. M.

J. M. McPHERSON, Secretary.

Office, Rooms 3 and 4, No. 311 California street, over Ætna Insurance Office, entrance 309 California street, San Francisco, Cal.

Kearsarge Consolidated Quicksilver Mining

Company. Principal place of business, San Francisco, Cal. Location of works, Lake Mining District, Lake County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first day of July, 1876, an assessment of fifteen cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, No. 10 Stevenson Block, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 28th day of August, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 16th day of September, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JAMES McHAFFEE, Secretary.

Office, Room 10, Stevenson Block, San Francisco, Cal.

Mariposa Land and Mining Company

of California. Location of principal place of business, San Francisco, Cal. Location of works, Mariposa County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 6), levied on the sixth day of July, 1876, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the sixth day of July, 1876, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, room 33, Nevada block, 309 Montgomery street, San Francisco, California, on Saturday, the second day of September, 1876, at the hour of nine o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

LEANDER LEAVITT, Secretary.

Office, Room 33, Nevada block, 309 Montgomery street, San Francisco, Cal.

Mariposa South Mining Company—Location

of principal place of business, San Francisco, Cal. Location of works, Spanish Belt Mining District, Nye county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the eighth day of August, 1876, an assessment, No. 1, of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 413 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of September, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the seventeenth (17) day of October, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.

Office, Room No. 2, 413 California street, San Francisco, California.

Northerly Five Cent Hill Gravel Mining

Company. Location of principal place of business, San Francisco, Cal. Location of works, El Dorado Co., Cal.

Notice is hereby given, that at a meeting of the Directors, held on the ninth day of August, 1876, an assessment of 75 cents per share was levied upon the capital stock of the corporation, payable immediately, to the Secretary, at the office of the company, room 33, Merchants' Exchange, California street, San Francisco, Cal.

Any stock upon wh ch this assessment shall remain unpaid on Monday, the 11th day of Septamber, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 28th day of September, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale. WARREN BRYANT, Secretary,

Room 33, Merchants' Exchange, San Francisco, Cal.

Taylor Mill and Mining Company—Principal

place of business, city and county of San Francisco. Location of works, Garden Valley Mining District.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of August, 1876, an assessment of forty (40) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 607 Montgomery street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 13th day of September, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the fourth day of October, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

SAM'L S MURFEY, Secretary.

Office, No. 607 Montgomery street, San Francisco, Cal

Tintic Milling and Mining Co.—Notice

to Stockholders. In accordance with a resolution adopted at a meeting of the Trustees of the Tintic Milling and Mining Company on the 14th day of August, 1876, a special meeting of the stockholders of said company is hereby called, the same to be held at the office of the company, No. 310 Sansome street, San Francisco, Cal., on Monday, September 18th, 1876, at two o'clock P. M., to decide upon the proposition to increase the capital stock of said company from $3,000,000, divided into 30,000 shares being the present capital, to $10,000,000, divided into 100,000 shares.

DEETKEN'S

ROASTING FURNACE,

For Gold, Silver and Copper Ores.

The roasting capacity of the Furnace, per 24 hours, is from 6 to 50 tons, according to percentage and nature of the sulphureted ore, with an expenditure of one and a half to two cords of wood, and two to three shifts of unskilled labor, according to amount of ore handled. The Furnace is adapted for chloridizing, as well as oxidizing, roasting, and for the manufacture of sulphuric acid. In point of cheapness of construction and efficiency in working, the Furnace is far the best in use. Millmen in need of a cheap and efficient Roasting Apparatus will apply to

G. F. DEETKEN,

Consulting Metallurgist, Grass Valley, Cal,

Furnace can be seen on application for permit, at Grass Valley.

Nearly One Thousand in Use.

BUFFALO PONY PLANER Will earn itself and pay expenses of running in 8 days. Price from $ 00 upwards, each. Also, small Pony Planers and Matchers, and Planing Machine Knives. Recommended as superior and extra in quality. Circulars free. One hundred Scroll designs free on receipt of stamp. Address

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93⅓

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

CAST STEEL SHOES AND DIES.
Guaranteed Cheaper than the Best Iron.
IMPORTANT NOTICE
Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,
59 Nevada Block, S. F.

Catalogues and Estimates given on application.

BEFORE PAINTING YOUR HOUSES

Send for Sample Card and Circular and Carefully Examine the

AVERILL CHEMICAL PAINT,

MIXED READY FOR USE.

This Paint is prepared in liquid form, READY FOR THE BRUSH. It requires no addition of oil or spirits. It is composed of the best materials known to the trade—Pure Linseed Oil, Strictly Pure White Lead, Pure Zinc, and the finest of coloring matter for tinting. It is the BEST, CHEAPEST, MOST DURABLE AND BEAUTIFUL PAINT IN THE WORLD. Is just what is wanted by every farmer, mechanic and everybody who has a house, fence, barn, or wagon to paint. Requires no skilled labor, as any one can apply it who can handle a brush. It is put up in cans of any required size, from a quart to five gallons, and is SOLD BY THE GALLON. It gives a firm, elastic and brilliant glossy finish, and will neither crack, peel or wash off, like most paint in common use, but is proof against rainstorms and all action of the elements. Buildings painted with this paint five years ago look fresh and like new to-day and will need no more paint for years. Of no other paint can this be said and proved.

The Averill Chemical Paint Company supply a long-felt want. They not only furnish a Paint more lasting, handsomer, and at the same time cheaper than the best of others, but it is in a liquid form—white and all the fashionable and most exquisite shades—ready for the brush. So that farmers, in fact everybody, can be their own painter if necessary. Indeed, all the buildings upon which the Averill Chemical Paint has been applied, are marvels of beauty.—*Christian Union.*

We know of no subject of such importance to householders as that of a good, handsome, durable paint for their dwellings. Within the past few years we have watched the progress of the Averill Chemical Paint and have had frequent opportunities to test it fully. We think it just the article to supply the need, and give it our hearty endorsement.—*N. Y. Independent.*

From the Thousands of Testimonials sent us, we select the following, which we present for your careful consideration:

A PAINT FOR FARMERS.—Prof. J. B. Turner, Jacksonville, Ill., is a man of great practical knowledge and experience; hence, we attach a great deal of value to the following, from his pen, which we find in the *Prairie Farmer:*

"Some two years ago I sent for and got from a barrel to a barrel and a half of Averill Chemical Paint, of light dun color, which I thought would suit me well enough for all work—houses, doors, blinds, fences, bee-hives, wagons, tools and all. I put two coats upon my residence here, and run over three or four of my smaller farm houses on my farms. With what was left I painted my bee-hives, wagons, wheelbarrows, rollers, harrows, fences, etc., etc. and on all these buildings, implements, tools, gates, etc., the paint is as hard and glossy to-day, so far as I can see, as it was a month after it was put on, and bids fair to hold its own at least for five years to come, (if not ten of them,) better than ordinary white lead and oil does for even two years.

"I have watched it now for about two years with interest and care, and have never found a single spot where it peeled, cracked, or chalked off, as our other paints do. Others who have used this paint like it equally as well. But the point is, I can take one and the same keg and brush, and go over all my buildings, wagons and tools, with no needless waste of paint, brushes or time. It is quite as good for inside finish, as it leaves a coat that shines and washes like glass."—*Moore's Rural New Yorker.*

THE AVERILL PAINTS.—In reply to some inquiries of our readers, we would state that we have given these paints, prepared by the Averill Chemical Paint Company, a full trial, and they appear to possess all that is claimed for them; spreading easily, adhering well, drying soon, and imparting handsome shades of color to the surface covered. Farmers and others who do their own painting, may avail themselves of the convenience of purchasing these paints, of any desired shade, already mixed for use, at a very reasonable price.—*Cultivator and Country Gentleman.*

PLACERVILLE, October 7, 1875.

TO THE CALIFORNIA CHEMICAL PAINT CO: Gentlemen—In reply to your letter I have to state that for more than six years I have dealt in and used your paint. I have during that time carefully observed its application and use, and from practical knowledge can certify to its unrivalled excellence. During my six years' acquaintance with it, there has not come to my knowledge a single instance of failure in any case where it has been used. All to whom I have supplied it unite in commending it for its superior claims over all other paints now in use. The Averill Paint externally used, or, in other words, exposed to the action of the weather, neither rubs off nor changes color, as do other paints, and will retain its freshness and adhesive property for years. Pure lead and oil will in a short time become dry, and are easily rubbed off; the loss of oil leaves the lead in a dry, oxidized state. As a matter of economy the claims of the Averill Chemical Paint to popular appreciation, and general use are beyond question. A house properly painted with it once will be better preserved, and present a neater appearance at the expiration of seven years, than it would if twice coated with lead and oil paints now in use. There can be no question, then, that to use it is both labor-saving and economical. So well assured and convinced am I of its established right to this distinction over all kinds, that had I fifty houses of my own to be painted, the "Averill" alone should be my choice and used.

Yours, very truly, S. J. ALDEN, Druggist.

UNIVERSITY OF CALIFORNIA, BERKELEY, August 16, 1875.

TO THE CALIFORNIA CHEMICAL PAINT CO: Gentlemen—In reply to your note of the 13th inst., I willingly state that the work done by you in painting the exterior of the North Hall or College of Letters is in every way satisfactory, and the appearance of the building since it was painted excites the favorable comment of all who have seen it. As I have had occasion to use the Averill Paint before, my experience has been such that I prefer it to any and all others when properly applied. I am very truly yours, RODT. E. C. STEARNS.

SAN FRANCISCO, SATURDAY, AUGUST 26, 1876.

VOLUME XXXIII Number 9.

The Electric Light.

The exhibition of the electric light, given by Father Neri of St. Ignatius college, is one of the prominent features of the Mechanics' fair. The college has on exhibition a very handsome and varied collection of philosophical instruments, selected from the apparatus in their rooms, prominent among which is the large magneto-electric machine, by means of which the light is produced. As great interest has been manifested in the exhibition of the light, we have had specially prepared a fine engraving of the machine, which is shown on this page.

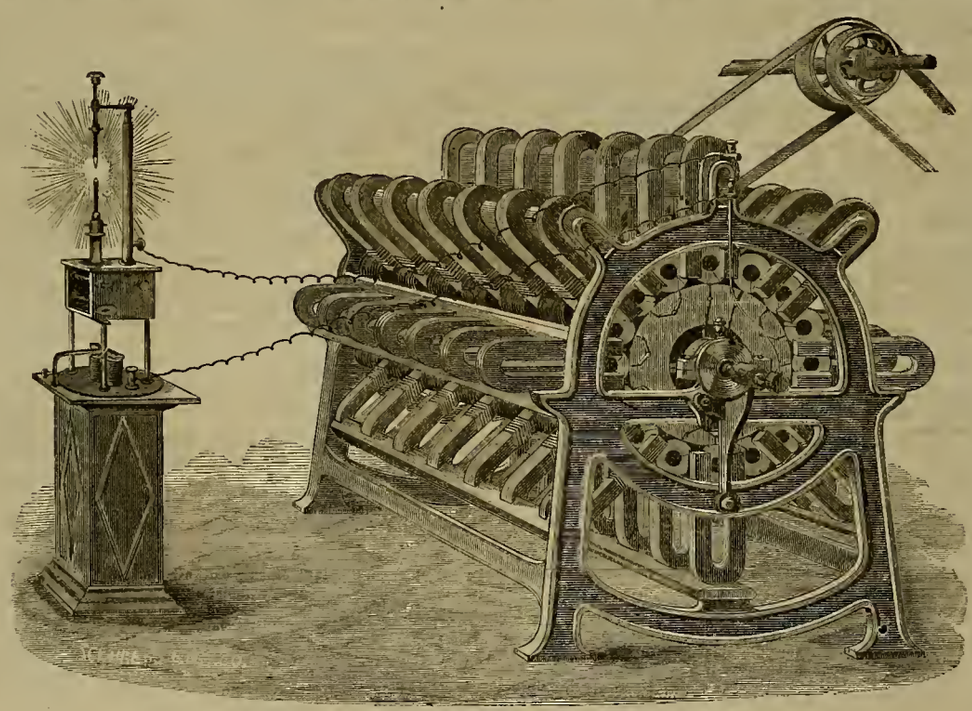
Magneto-Electric Machines.

As those who have witnessed these exhibitions can readily understand, very powerful effects can be obtained from magneto-electric machines of large size driven rapidly. Such machines were first suggested by Professor Nollet of Brussels, and the one used by Father Neri was made by the "Compagnie l'Alliance of Paris." It is by means of these machines that the electric light is maintained in first-class lighthouses; though there are but six such in the world. They have also been employed to some extent in electro-metallurgy. The machine in question has eight rows of compound horse-shoe magnets fixed symmetrically around a cast iron frame as shown in the engraving. They are so arranged that opposite poles always succeed each other, both in each row and in each circular set. There are seven of these circular sets, with of course six intervening spaces. Six bronze wheels, mounted on one central axis revolve in these intervals, the axis being driven by steam power transmitted by pulley and belt. The speed of rotation is usually about 350 revolutions of the axis per minute. Each of the six bronze wheels carries at its circumference 16 coils corresponding to the number of poles in each circular set. The core of each coil is a cleft tube of soft iron, this form having been found peculiarly favorable to rapid demagnetization.

Each core has its magnetism reversed sixteen times in each revolution, by the influence of the sixteen successive pairs of poles between which it passes and the same number of currents in alternately opposite directions are generated in the coils. The coils can be connected in different ways according as great electro-motive force or small resistance is required. The positive ends are connected with the axis of the machine, which thus serves as the positive electrode and a concentric cylinder, well insulated from it, is employed as the negative electrode. When, as in the case in question, the machine is employed for the production of the electric light, the currents are transmitted to the carbon points in alternate directions as they are produced. For electro-metallurgical purposes they are brought into one constant direction by a commutator affixed to the machine. The driving power of a machine of this kind for use in light-houses is about three horse power.

Many changes have been introduced in this class of machines since that of the Compagnie l'Alliance made the first practical application of the principle discovered by Faraday. Wilde & Ladd, in England, constructed large machines, but practically failed; and even the very recent Gramme machines cannot be said to be yet a perfect success in all respects and to supersede the machine above described. They develop too much heat, require larger driving engines and get out of repair too easily, which is not the case with the older pattern.

The electro-magnetic machine at the fair weighs about 4,000 pounds, and cost in Paris 12,000 francs without any of the appliances.



MAGNETO-ELECTRIC MACHINE FOR PRODUCING THE ELECTRIC LIGHT.

This machine has been very much

Increased in Power

By simple means applied by Father Neri. The principle of the improvement has been understood but this is its first application to the present machine. The improvement consists in coiling around the extremities of the magnets insulated copper wire and passing currents through them to strengthen the magnetism and thereby intensify the action. As the currents are in proportion to the intensity of the magnetism of the magnets and the wire increases the power of the magnets, the effect is proportionately increased by the use of the insulated wire. Although this improvement had been tried on a small scale by Father Neri, the night of the first exhibition at the fair was the initial exhibition since its application to a large machine. It is found to fully double the effect of the machine. Over 5,000 feet of wire are used in wrapping the magnets and it is estimated that the light produced is equal to the power of from 10,000 to 12,000 candles. The current can be turned off or on the coils of the wire at pleasure.

It is to be presumed in this age of universal education that most people understand something of what is known of electricity, so we need not go into the subject in detail in this connection. With regard to the

Electric Light,

However, sufficient may be said to jog the memories of those whose school days have long gone by. When two pointed pieces of a conducting kind of carbon, such as that which is deposited in the retorts at gas works, are connected with the poles of a powerful battery, each as the one described, a brilliant light is obtained by bringing them together so as to allow discharge to take place between them. This discharge when once obtained is not interrupted by separating the points to some distance—greater in proportion to the electro-motive force of the battery; and the interval is occupied by a luminous arch (known as the *voltaic arc*), of intense brightness. This brilliant experiment was first performed by Sir Humphrey Davy, at the commencement of the present century. The light appears to be mainly due to the incandescent particles of carbon which traverse the space between the points. The transport of particles is made visible to a large number of spectators by throwing an image of the heated points on a screen with the aid of a lens. The voltaic arc

Exceeds in Brightness

As well as temperature all other artificial sources of heat. The light of the voltaic arc has a dazzling brilliancy, and attempts were long ago made to utilize it. The failure of these attempts were not due so much to its greater costliness in comparison with ordinary sources of illumination, as to the difficulty of doing it effectively. Its brilliancy is painfully intense, as it dazzles rather than illuminates, and it cannot be produced on a sufficiently small scale for ordinary purposes of convenience. There is no mean between the absence of light and a light of overpowering brilliancy.

Use on Lighthouses.

There is, however, one application in which these peculiarities of the electric light are positive advantages, penetration being the essential requisite; we mean the lighting up of lighthouses. Here the office of the light is not to render other objects visible, but to be itself seen, and in this respect, in hazy weather, the electric light is found decidedly superior to oil lamps. The electric light is also extensively used for throwing images on a screen, for producing luminous effects at theaters, and for enabling laborers to carry on work at night.

Regulators.

As the carbons undergo waste by combustion it is necessary to employ some means for keeping them at a nearly constant distance, so as to give a steady light. Several different regulators have been employed for this purpose, all of them depending on the principal that the strength of the current diminishes as the distance, and consequently the resistance, increases.

Father Neri uses the usual form of regulator adopted in lighthouses, with sometimes a spherical and sometimes a parabolic reflector. This regulator is shown in the engraving, connected with the machine. The details of mechanism of this machine contain some ingenious devices which our limits do not permit us to explain. The arrangement is such that the carbon points are kept at an almost exact equal distance apart, notwithstanding the steady combustion.

The exhibitions given by Father Neri with this light are very interesting, the immense Pavilion being completely flooded with light, so strong that people at some distance are compelled to shade their eyes. Its full effect is not, however, seen, as the gas is not turned off during the exhibition. Electricians well understand the value of Father Neri's improvement above mentioned, when it is stated that with this machine he is enabled to keep at a white heat, for any length of time, a platinum wire .035 of an inch in size and six feet long.

Pacific Saw Manufacture.

The finest display of home manufactured articles on exhibition at the fair is conceded to be that of Messrs. Spaulding & Co., of the Pacific saw manufacturing company, Nos. 17 and 19 Fremont street. Their exhibit may be found on the wall, divisions E, F, and G, to the right of the glass works display, and for value, taste and variety is not outdone by any in the Pavilion.

In value it runs up into the thousands, for there are several saws in it that are worth from $200 to $400 each. The exceeding taste with which it is put up proves that some member of the firm is possessed of artistic talent as well as mechanical skill, and might turn his attention that way with possibilities of success. Wheels of large magnitude are formed out of minute saws of different lengths. Some containing over a hundred each, others a smaller number. The Centennial year, 1876, is seen neatly constructed of saws not old by any means stars and crosses abound; vines of hand-saws are artistically turned around and through the whole; the whole is surmounted with the company's name in letters of steel saws and paper sections. The whole is beautiful, interesting, instructive, valuable and indicative of the success of the enterprise embarked in only ten years ago. Mr. Spaulding is the inventor of the patent movable teeth bearing his name, which are now in general use in nearly all the large mills on this coast.

The art of forging and tempering large circular and long muley saws, is one possessed by but few workmen, and it is only by securing the most skillful of these and the use of improved machinery that this company have been enabled to command and retain the patronage of the mill owners of this coast. The strong competition and low prices ruling the lumber business has compelled the mills to adopt the best machinery and saws the world afforded and this trade has flowed into Mr. Spaulding's hands. The immense size of the logs produced by our redwood forests, renders very large circulars and long muley saws necessary for economically working them into lumber. One mill on the Mendocino coast has a muley saw 16 feet long, though 12 feet is the common length in most mills for splitting the logs into slabs for the circular, which is usually five feet in diameter. Such a circular costs about $400.

This company also manufacture and exhibit reaper and mower sections, carriers' knives, saw mandrils, saw swedges, crosscut saws of every length, butcher, keyhole, hand and wood saws of every description, of the best quality and lowest price. They deservedly have the patronage of our mill men and mechanics.

The third and most destructive of the crop caterpillars have made their appearance in great numbers throughout Georgia, and farmers are apprehensive of almost a total destruction of the cotton crop through the prairie belt.

"Wild Bill," a notorious frontier character, was killed in the Black hills, the other day, by a pistol shot.

List of Exhibits at the Eleventh Industrial Exhibition of the Mechanics' Institute.

From Entry Book No. 1—1 to 200.

1. A S Hallidie, wire work, etc.
2. Mrs H Kozminsky: 1 quilt, "Job's Patience."
3. Thomas McKibben: 4 iron (patent) wheelbarrows.
4. Mrs M V Kendall: 1 frame of hair work.
5. Mrs P V Merrill: 1 worsted quilt.
6. Miss M Dunlap, Mission and 22d streets: 1 water color painting; 1 painting on china.
7. Mrs Esrl Bartlett: 1 quilt, knitted by an old lady 74 years old.
8. Miss E J Wilcox: 1 case of zephyr flowers.
9. John D Godeus: 1 oil psinting.
10. Miss Annette Jones; 1 basket of wax verbenas.
11. J Hendrickson: 1 inlaid ladies' dressing case.
12. Miss Annie Doble: 1 worsted wreath.
13. Mrs Barbara Smith: 1 knitted bedspread
14. Miss Jessie Redden: 1 patchwork quilt (double Irish chain).
15. Mrs H Forster: 1 case lacteous farina.
16. Mrs A F Smith: ornamental toilet sets made from oiloloth.
17. Walter Phelps: 2 pine cone frames.
18. Mrs Mary Carrigao: 1 patchwork quilt, red, white and blue.
19. Mrs E I Brown: 1 old fashioned log cabin quilt, 2,220 pieces.
20. Sanborn & Duval: 1 set buggy wheels; 1 set lumber wagon wheels; 1 set truck wheels; Duval's patent.
21. Mlle Celine Lemoine: 1 crochet bedspread.
22. Golden Gate Academy: 7 frames of ornamental penmanship.
23. E B Smith & Co: Litton Springs seltzer water in jugs, bottles and kegs.
24. A Kruger: specimens of wood engraving.
25. Mrs N J Healey: 1 vase wax flowers; wax cross, wax basket, worsted wreath and wax wreath.
26. C T Peters: 1 model of full rigged ship.
27. C. Leonard: specimens of machine rope and spiral molding.
28. Mrs Annette Jones, Alameda: 1 wreath (in frame) of preserved ferns, 1 wreath (in frame) of wax flowers.
29. Mrs A C Flood: 1 basket wax flowers, 1 bouquet wax flowers, 1 pond lily (wax), 1 cross (wax).
30. Mrs H Butler: 2 embroidered baby's shawl.
31. Mrs F S Regensberger: 3 pieces needle work.

From Entry Book No. 2—200 to 400.

201. Linforth, Kellogg & Co: 1 Pitt threshing machine, 1 wood beam sulky plow, 1 cultivator, 1 corn sower, 1 sulky rake, 1 harrow, 5 small plows, 1 fan mill, 1 Wood mower, 1 seed drill.
202. M C Hawley: 1 Buckeye self raker, 1 trade engine.
203. Samuel Gray: model twin stairease and elevator.
204. H. Palmer: 35 cases red mountain wine
205. S P Taylor & Co: 33 bundles and rolls book, news, blank langing and blue paper.
206. E M Benjamin: 3 West Coast safety ladders.
207. John Bergstrom, S F.: 1 large church organ, 24 stops.
208. James H Gates: 7 soda water and other fountains.
209. Cal Fertilizing Co: 6 barrels fertilizing materials, guano fluids, etc.
210. E Hook: 4 Townsend's patent tables, called the "household treasures."
211. R W Brehm: turned work from California woods and samples of California woods.
212. F Ogden: 1 Tulloch's automatic ore feeder.
213. Cal Spring Bed and Mattress Manufacturing Co: 4 Crandall beds, 4 curled wool mattresses, 2 bedsteads, 2 cribs and mattresses.
214. Alex Mackay, domestic carpet manufacturing Co: 13 pieces carpet; 66 bundles colored twine for carpet warp.
215. W Paulson: 3 rustic fern cases, 1 rustic bench, 1 rustic chair and 1 turning lathe.
217. Robert A Mortin: 3 crayons framed.
218. A D Hatch, agent: Wendell's patent doorstop and fastener.
219. E K Howes & Co: display of woodenware.
220. Smith Bros: display of borax in all forms.
221. Linforth, Kellogg & Co: 1 Russell's self-raking reaper.
222. F Altman: 1 Lotman's feed mill.
223. F Altman: 1 pony power.
224. Sanborn & Byrne: 4 stair newells and balusters
225. Jas E Gordon: 2 lawn mowers; 1 file show card.
226. Jas E Gordon: 1 chain forge and tools.
227. J Gray & Co: 8 spring beds, 3 bedsteads 1 crib.
228. Jos Browell: a large collection of patent chimneys and chimney tips.
229. H O Reichardt: display of hardware.
230. Linforth, Kellogg & Co: 1 Maosfield threshing engine.
231. D M Osborn & Co: 2 No. 6 Wheeler combined reaper and mower, 1 No 6 mower (Wheeler), 1 No. 5 mower (Wheeler), 1 Kirby mower No 1, quantity of sections and knives.
232. D S Dow: specimen of penmanship.
233. W S Moses: pastry bureau.
234. O R Coe: 1 lifting machine, 1 Fairbank's platform scale, 1 lounge, 2 chairs. Mason's reactionary lift.
235. S C Gray: 6 sides "Union Crop" sole leather.
236. Geo F Atkinson: articles of California wood (turned).
237. Geo F Atkinson: 1 J A Fay wood turning lathe.
238. H Palmer: samples of California wine.
239. John V Hoffman: case contained cylinder writing desk.
240. H N Cook: 1 coil double leather belting, 2 doz leather fire buckets, 1 doz bullion leather bags, 4 leather mail bags, 8 canvass express bags, 3 press packings, 7 hides of lacing leather.
241. R A Martin: 17 frames of photographs and crayons.
242. Cal Bellows Co: 1 smith's bellows.
243. Thompson Bros: 3 vault covers for pavements, etc, 1 ring, 6 illuminating titles.
244. Hutchings & Co: samples of refined and crude whale oils.
245. Hueter Bros & Co: case of samples of varnish, 26 cans, show-case containing 86 fancy jars of colors, frame containing brushes, frame containing bronze and other metal powders.
246. A L Bancroft & Co: 11 frames with samples of printing and lithography, 1 case illustrating the process of zincography, 5 mounted maps.
247. Rubber Paint Co: samples of rubber paint, various colors.
248. Linforth, Kellogg & Co: 1 Fish Bros 4-spring wagon, 1 Meyer's gang plow.
249. Newmao Beonett: 2 soda fountains, 1 case Rimmel's perfumeries, miscellaneous assortment valentines, bon bons, etc.
250. Locke & Montague: marbleized iron mantles, nickle-plated grates, fancy coal vases, polished fire irons.
251. R Russly: miscellaneous collection of Chinese and Japanese fancy goods.
252. Joseph Bros: 33 boys' clothing stands, with clothing attached.
253. F A Huntington: 1 shingle machine and jointer.
254. John E Perkinson: flexible Harrow "Inverted Diamond."
255. Howard & Morse: 10 rolls wire cloth.
256. H Williams & Co: display of Yerba Buena bitters.
257. Frank Bros & Co: agricultural implements, viz: separator, steam stacker, farm wagon, harvester. binder. reaper, mower, gang plows, cider mill, grain drill, seed sower and Hoadley's engine.
258. W E Garratt & Co: steam pumps, brass goods, church bells, and general assortment of engineers' findings.
259. E O Hunt: 2 Centennial windmills.
260. S F Journal of Commerce: products of California, wool, seeds, etc.
261. John W Quick: 33 perforated screens. various sizes.
262. Geo Hayes & Co: 2 patent skylights, design for metal window, specimens of galvanized iron work, specimens of zinc work.
263. J Hendy & Co: 2 concentrators, 1 ore feeder, 1 lathe, 1 planer
264. Hakes & Carroll: 1½ doz Ellis' patent burners and regulators, ½ doz globes and holders, 1 toy table (Francis patent), 1 doz Stockwell self-lighting gas burners, 1 patent test metre.
265. Seward Cole: asbestos material.
266. Mrs Westwater: picture "Magdalen."
267. Peter Burns: display of ammonia soap.
268. Gray & Winslow: zinc monuments.
269. H Fishbeck. display of toilet, bleaching and common soaps.
270. Chas Otto: 1 show case contained cutlery and mechanics' tools; lot of hinges and sample board.
271. Linforth, Kellogg & Co: Fish Bros' platform wagon.
272. M C Hawley & Co: 1 gold medal separator, 1 portable steam engine, 2 French burr stone mills, 1 challenge feed mill, 1 Buckeye drill, 1 Deere gang plow, 2 Deere single plows.
273. M C Hawley: 1 Regulator windmill, 2 Rumsey pumps, 1 corn and cob crusher, 1 Schuttler's spring wagon.
274. S F Gaslight Co: Preparation of ammonia.
275. M C Hawley: 11 Enterprise coffee mills, miscellaneous collection of hardware, sample card of fancy butts.
276. J C Bidwell: Agricultural steels and iron ware, cast steel castings, carbon bronze for journal bearings.
277. Dr W S Beebe: Case of dental goods.
278. Snook Bros: Artificial stone for floor and pavements.
279. M G Griffin, agent: 3 Bickford's family knitting machines.
280. Linforth, Kellogg & Co: 1 Enterprise coffee mill.
281. Hartshorn & McPhun: Window shades, rollers, and opaque shade cloth.
282. M C Hawley: Perpetual hay press.
283. Savage & Son: Ranges, vase, and fountain, mantels, grates, dumb-bells, swedge blocks, tire upsetter. radiator.
284. W C Quimby: Six statues.

From Entry Book No. 3—400 to 600

401. J E Firman: pen drawing, ornamented with water colors.
402. H C Langrehr: 2 drawings, 1 heading machine and 1 burring machine.
403. Ventura Rock Soap Co: 40 boxes rock-soap.
404. P D Paul: 11 patented chimney tops.
405. J J Agnew: 1 cabinet of lava specimens.
406. Moody & Farrish: 1 glass case of wool.
407. S G Hanzsche: 1 child's play house.
408. G A Raymond: 23 cases scales.
409. Redington & Co: 1 stand flavoring extracts.
410. Yates & Co: 5 barrels, 2 baskets and 8 boxes of lamp goods
411. Tubbs & Co: 33 coils of rope, 1 package of hemp.
412. E A Hubbard: 5 desks, 6 chairs.
413. Gladding, McBean & Co: 39 pieces iron-stone sewer pipe.
414. Alta Soap Co: 43 sample boxes of soap, 1 show case sample.
415. I Ash: 1 ornamented fur, 1 show case, samples of dyed furs.
416. C Allison: 3 drill sockets, 4 drills.
417. John A Guffigao: 1 specimen of penmanship.
418. C J Williams: 1 lap board, ladies' sewing table, 1 child's folding toy table.
419. G A Raymond: 9 boxes of scales, 1 combination beam.
420. Cal Bleaching Soap Co: 9 boxes of soap 1 show-case samples soap, 1 show-case samples wool.
421. Pacific Corrugated Stovepipe Co: 25 pieces corrugated elbows.
422. A Romao & Co: a general assortment of desks, blank books, stationery and fine hooks.
423. C J Kiog of William & Co: a general assortment of hermetically sealed goods. pickles, jellies, etc.
424. W K Vaoderslice & Co: a general assortment of silverware.
425. Main & Winchester: 1 fine silver-mounted geot's saddle, 1 fine side saddle, 6 doz fine buggy whips, 3 doz fine lap robes, 20 sets fine buggy harness, 3 doz fine stage lashes, 2 doz fine stage stock, 3 doz interfering boots, 1 doz fine horse blankets, etc.
426. W S Townsend: 2 silver-plated show-cases of caodies.
427. Weed & Kingwell: a general assortment of bells and brass work.
428. Wm Rowland: 1 quilt that was made 96 years ago.
429. Kohler & Ritter: 3 show-cases California make sterling silverware.
430. F Marriott: three fancy rugs.
431. Ed Newmano: 1 pencil drawing, title "The Germao Poultry Dealer."
432. Herman Glanch, 1 frame fancy penmanship.
433. Lancaster & Northon: 24 pieces of cloth.
434. Hammam Baths: 2 Turkish bedsteads, 2 Turkish stools, 2 Turkish mattrasses, 2 Turkish pillows, 1 Turkish table, 3 Turkish towels, 3 Turkish sheets, 2 Turkish brushes, 2 Turkish gloves, 2 Turkish scrapers.
435. Hoey & Taylor: 3 patent sofa beds
436. Mrs N F Forsman: 1 rug.
437. Mme H Cantel, lace meuder: 1 show-case containing a general assortment of laces and curtains done up.
438. Mrs G F Haustorf: 1 hair wreath; 1 bouquet
439. Albert G Nye: 4 oil paintings in gold frames, 2 pieces sea mosses in frames, 2 pieces sea mosses under glass shades, 1 sign in frame.
440. J Renz: a general assortment of herb bitters, blackberry brandy and bonanza bourbon whiskey.
441. R W Jackson: 2 show-cases abalone shell jewelry.
442. Low & Chartoey: 14 pieces cast iron work.
443. Mrs J H Nevins: a hat made of 2,500 pine leaves.
444. Jas S Cosgro & Co: a model of a life boat.
445. J R Gates & Co: a show-case containing a general assortment of drugs, etc.
446. W I Tustin: 1 model of an economy windmill, 1 eagle horse power windmill. 1 economy horse power windmill, 1 dairy queen horse power windmill.
447. Miss Anoette Jones, 1 wax wreath.
448. Hall Treadle Manufacturing Co: 6 Home sewing machines, 5 shuttle home sewing machines, 1 Hall treadle jig-saw, 1 Hall treadle grinding machines, 2 models, 1 large and 1 small.
449. T Duffy: 2 rustic vases, 5 rustic stands, different sizes, 1 rustic large double jardeniere, 1 rustic whatnot, 1 rustic table inlaid, 2 rustic sofas, 1 rustic glass fern case, 3 rustic ornamented boxes.
450. Elizabeth Garton: 1 bedspread woven in the year 1786.
351. George McIntyre: 1 kitchen accomodation chest.
452. D S Hutchinson: 1 glass shade specimens of mechanical dentistry.
453. W Hyde: 2 child swings, 2 adult's swings, 1 swinging hobby horse.
454. Mrs Albert G Nye: prepared sea mosses, 3 moss albums.
455. Mrs. J P Murray: 1 Afghan.
456. Mme Mourgeaoon: 1 Turkish fancy spread, 1 fancy rug, 1 embossed picture, toilet articles.
457. Miss A W Baker: a general assortment of Boston dress reform undergarments and combination shoulder brace corsets for ladies and children.
458. Mrs Davison: 1 bouquet hair flowers.
459. Figer Bros: a general assortment of brushes and patent brooms.
460. Mrs R Eppler: an assortment of hair work.
461 Hill & Beebee: samples of the chemical wonder.
462. Mrs D W Rich: 1 frame worsted wreath, 1 glass shade worsted birds.
463. Polheim & Lancaster: a general assortment of cloth and custom made clothes.
464. Flint & Peabody, paper barrels, paper buckets, ¼ barrels, ½ barrels.
465. Mrs Annette Clark: 4 specimens of needle work.
466. John West: 1 Centennial palace squirrel cage, 25 ladies' favorite sewing, cutting, and toy tables.
467. Mrs Sullivan: 1 show case stamps and stamped goods, 1 show case embroidered goods.
468. Woodward's Gardens: 3 cases animals, birds, and specimens of natural history.
469. Mrs Martin Scott: 5 pieces tatting.
470. Chas W Deares: Specimens of poster engraving.
471. J M Brown: 1 piece tappa cloth, 2 pieces coral.
472. E T Buckham: 8 pair side lights, 2 binocle lamps, 1 masthead lamp, 1 bulkhead lamp, 4 bracket lamps, 1 swinging lamp, 2 police lamps, 2 hurricane lamps.
473. B H Freeman & Co: stair builder.
474. Mrs Mollenbush; 2 worsted pictures in frames.
475. Mme Celine Lemorine: 1 crochet bedspread.
476. Mrs H Enright: 2 patchwork quilts.
477. R Alexander: 1 glass shade wax fruit.
478. Hiram Yaw: 8 cow and sheep bells.
479. B C Vontall: 24 Bishop's Directories.
480. W G Halsey & Co: 3 Kendall's hydrostatic safety lamps.
481. Lachman & Jacobi: A general assortment of wines and brandy.
482. Conklin & Co: 1 frame stereoscopic pictures.
483. Wm Stokes: 1 architectural design.
484. Mrs Moore: 2 patchwork quilts.
485. J R Walton: 1 milk wagon and cans.
486. Mrs M Kickeos: 1 crochet bedspread, 1 crochet tidy.
487. Mrs G W Tuthill: 1 embroidered quilt.
488. C Boeroer: 1 square piano, 1 upright piano.
489. Madame Balcear: 1 frame testimonials, 1 frame photographs, 1 case hair restoratives.
490. Bergman Bros: A general assortment of Sacramento pottery, Rockingham stone, yellow earthenware, and terra cotta.
491. N Clark: A general assortment of Pacific pottery, iron stone, sewer pipe, fire brick, etc.
492. Palmer, Knox & Co: 2 patent suction and pressure blowers.
493. Jas E Gordon: 1 show card handles, 1 show card tacks. 1 show case locks.
494. McCue: 1 platform hatcher wagon.
495. Ernest Raosom: 1 straw burning machine.
496. Pierre Dutripon, 1 carved woodeo table.
497. Mrs S Wilson: 1 Centennial quilt.
498. Mrs Cole: 1 patchwork quilt.
499. Domestic S M Co: 7 sewing machines, 1 sewing machine table, 2 cases of fashions, 1 lambequin, 6 trimmed suits.
500. Frances J Ware: 2 lace tidies.
501. Edward G Decolstoo: 2 show cases of silver ware (plated), 1 amalgamating plate (silver plated).
502. Edward Levy: 1 show case Centennial erasive soap.
503. Miss Frankie Williams: 4 framed pencil sketches.
504. Mrs. Heyman: Samples of lace and insertion, hand made.
505. C J Williams: 1 ladies' lap sewing table, walnut.
506. Stockton & Edwards: 4 patent stepladders, 1 ladies' invalid chair, 1 section of ornamental fence.
507 W H Wing & Co: Lasts, finished and unfinished, boot trees, shoe trees, crimps, clamps, and stretchers.
508. Miss E Leotall: 2 crochet tidies, 2 bead pin-cushions
509. Mrs B S Harrison: 1 silk bed quilt, 4,114 pieces.
510. Holbrook, Merrill & Co: A general assortment of stoves and ranges.
512. C Donner & C Suhl: 1 hay cutter and grain sheller.
513. C F Marwedel: 1 case of machinists' tools, 2 sample boards of molder's tools and set screws, 2 wire screens.
514. E H Marwedel: 1 sample board of stair rods. 1 sample case of dog collars, pictures, knobs, and nails.
515. Standard Soap Co: 1 glass case toilet soap, sample of soaps and washing powder.
516. Theodore Hermann & Co: 1 Theo Hermann aquarium, 2 show cases shells, selections from the reserve cabinet of T Hermann, 1 show case specimens of bird skins.
517. D B James, Visalia: model of one-track railway and track.

CLEOPATRA'S NEEDLE.—The proposal to bring over this famous monolith and re-erect it in London having apparently met with no response, some of the good people of Glasgow are bestirring themselves with a view of appropriating the obelisk as an ornament to the "western" metropolis. Glasgow possesses many good sites, and has at present few monuments of any sort, and probably government would interpose no obstacles in the way. It is not generally known that besides the obelisk standing in Alexandria, close to the terminus of the Ramle railway, there is another in much better condition lying prone at its base. Both were originally erected in Thebes, then in the hight of its glory, and at a much later period removed by the Greeks to Heliopolis, near Cairo. The Romans still later brought them on to Alexandria, placing them where they now are, subsequently to which that which is now prostrate was thrown down, and buried in drifting sand. To this is doubtless owing its better preservation. It was discovered by Mehemet Ali about 60 years ago, while engaged in restoring the fortifications of the city, and by him offered to this country. It is said to be in very good condition; and if the Glasgow people have public spirit enough to raise the moderate sum necessary for its transport to the banks of the Clyde, nobody will begrudge them its possession.—*Iron.*

MECHANICAL PROGRESS.

The Cornell Measuring Machines.

The mechenicel engineering department nf Cornell nniversity seems tn be alive and eccomplishing eome orlginal and valuable work. The latest achievement is a measuring machine of which the following description appears in onr Eastern exchanges.

The measuring machine thoogh useful for other purposes, wes specially designed for the mannfactore of standard gaoges, and measure from 0° to 12″ to 1-10,000th of an inch, which is as fine as it is practicable to work in ordinary machine shop ose. The machine, although resembling a lathe, is only about 18 inches in length, and has the three legs cast with the bed and is made to set upon a table or bench. Tho measuring screw has 16 threads to the inch, and the gradoated wheel is divided into 625 equal parts, so that the movement of the wheel, one of those divisions, changes the distance between the measuring points of feelere the 1-10,000th of an inch.

The screw has a travel of a little more than one inch and the length of the thread on the screw and the thread in the nut are eqoal, so thet the wear will remein equal. The handle for turniog the wheel is not fixed in the wheel itself, bot to a friction bar, which by the central nut is set so as to give friction enough to just turn the screw, yet not so mnch but thet it will slip when the two measuring pointe or feelers come in contact.

The arm or index from which the reading of the machine is made is not fixed firmly to the body of the machine, but it is threaded opon the projecting boss and is moveble back and forth, so that in adjnsting the machine it is not necessary to set the beck feeler with great accoracy; for when it ie set nearly correct aod the two feelers brooght in contect, the iodex can be torned beck or forwards until it coincides with the zero mark on the wheel.

It was the aim to make the screw 16 threads to the inch, and if it had been perfect then, the index from which the reeding is taken shonld exactly coincide with the axis of the screw; bnt the finished screw proved to vary about one in 5,000, and hy cutting the index to the proper angle this imperfection was corrected to the greatest accuraoy.

To nse the machine for measuring pieces longer than one inch, and less than two inches, the foot-stock is set back about one inch, a standard inch piece is set between the two feelers, and the handle turned until the friction ber again slips; the index is then moved until it coincides with the zero mark; and so by using a set of staudards varying by inchee from one to eleven, all sizes up to a foot can be measured, and the machine is elways adjusted at the time of taking the measnrement.

Sheffield Comino to Americe.—It is reported, says the Boston *Advertiser*, and apparently it is to be believed by those who should be most interested in knowing whether the report is trne or not, that there is to be an exodns of British steel manufecturers to this country. All that is positively known, however, is that one large Sheffield firm has been buying property in the vicinity of Syracuse, with the intention of going largely into the manufactore of steel for tne American merket. It is said further that there has been some sort of a hitch in the arrangements, and that the enterprise is not yet wholly certain to be undertaken. There ie, of oourse, no sort of objection to the coming of Britieh makere of steel, if they think they can make any money by so doing. We ehould encourage them to come and bring their capital with them. The field ie open to them. If they come it will be a new triel for the system of protection. Moreover, the threetened invaeion of the United States by the Britieh manufactnrers is n good symptom in another aspect. The iron nnd eteel trades are in a condition by no meens preeperous et present, either in this country or in England. This fact is ae well known to the Sheffield manufacturers ns it is to oe. If, therefore, they see fit to transfer their hueiness to this country in the present season of depreesion, it ie an indication thet they thiok the day of great prosperity for the trade in England has passed, and that they believe the United States will become the best field for the exeroise of their trade.

A Large Belt.—One of the largest leather belts in the world was recently made in England for a large cotton epinning mill in Bolton This helt, mede of the best English leather, is three feet eight inches in width, and 90 feet in length; donble or two tbickneeses without a single oross joint from end to end, and of equal thioKness throughout. The belt is for driving direct from the fly wheel of the engine, and to transmit 350 indicated horse power. The same establishment recently manufactured two other double belts, each 29 inches wide, driving direct from the fly wheel of the engine. The driving pulley is 28 feet in diameter, and five feet on the face, oromed or turned up for the two belts, which travel throngh 4,500 feet per mioute, transmitting 600 indicated horse power. Such belting ie claimed to be particularly adapted for driving, and has the advantage of running perfectly straight.

Retuaning Steam to the Boilen.—Our London exchange, *Iron*, says that a novel experiment was oommenced nn Friday with the 80 horse-power engine in Portemonth dockyard, ft was with a new pnmping process, hy which the inveotor, Mr. R. M. Marchant, of Hatton Garden, nndertakes to return satorated steam to the boiler of any engine, inetead of coudensing steam from the cnndensors. In other words, after the steam has exerted its power in the cylinder, the manufactured article itself is to be taken up and re-pnmped into the boiler so as to he used afresh. Mr. Marchant claims for his invention that he is ablo to re-pump steam into the boiler withont any expenditure of foel beyond that which is required to overcome the mere friction of the pumps, and without subjectiug them to pressure. The inventor contends that hy the law of geses the pressure exerted by steam on one side of the pistou represents hy its elastic power, as in the case of the resistance of a spiral spring, the same expression of power in pressure on the other side of the pistoo; so that the elastic charge is always ready to give back the exect power expended to the purpose of its expressiou. Consequently, if Mr. Marchant's reasoning be correct, he expects to he able to retnrn in volume and pressnre to the boiler the equivalent of the power expended on the pomps, and eo to apply the steam again to power. It therefore follows that, inasmnch as returning boiliug water into the boiler saves the cost of reboiling it, to return steam into the boilers, as steam will save the far greater cost which is expending in msnofscturing it. As steem coste 75 in the the 100 of the fuel which is consumed in its production, the saving which will he effected by the eucessful application of the principle will be great.

Great Belts.—The correspondent of the *American Manufacturer* tells how the large helts in the machinery hall ot the Centenuial are made: There are three very large belts, the smallest a double one, 30 inches wide, the next 36 inches wide, and the largest, three feet wide and 148 feet long; this lest weighing 1,130 poonds. One belt, 15 inches wide, wes used at the Franklin institute exhibition in 1874, when it trsnsmitted 90-horse power to the different machinery there exhibited. This style of belting is made by cementing between a given nnmber of thicknesses of leather—according to the strength desired—a certain nomber of layers of heavy cotton oanves, and riveting or stitching throughoot its length. The canvas is taken from a roll without a break in the entire length. One party having tested this belting shows one two and a half inches wide that broke at 3,100 pounds tension, while another of same width, with two ply of csnvas, broke at 5,100 pounds tensiou. There are various ways shown of splicing leather belting; some have steel bands passing through, others sewed with raw hide and waxed thread, others egain are riveted with copper or iron rivets, and many are sewed with raw hide and pegged. We are told that in making the wide belting of dooble thickness the hides are ent along the middle, the back edges turned outwerd and side edges inwnrd, inserting a center piece to joints widthwise, thus stretching the center of the belt more then the edges, causing it to take a firmer hold on the pulleys.

A Great Army Cook Shop.—The Germau government hes just completed en immeoee establishment at Mayence for preparing provisions for the army in time of war. The main building is more than a thousand feet long, with four exteusive wings. A railway branch rons directly into the grounds. Two engines of 1,800 horse power are used to run tho mahinery. The water ie drawn from welle fed hy the Rhine, and ie pumped up hy steam into a reservoir whioh will hold about 500,000 gallons. When the manufactory is in foll work it will be capable of boiling down and condensing 170 oxen per diem, grinding 350 tone of flour, and of making 300,000 loaves of bread. It will also be ahle to supply enough preserved oats for a day's feeding of the horses helonging to an army corps of 280,000 men. To guard as much as poesible against fire, the whole of the buildings, including the roof, are of etone aud iron.

Parallel Rules.—For linee parallel to the sides of the drawing boerd, the T-equere is the best poesible parallel ruler, end may be used in conjunction with set square of 45 deg. for miter aud similar linee. The set square of 60 deg. by 30 deg. will give inoreased faoilitiee in setting ont many ornamental geometrical forms. A T-square with ehifting head is also very useful; bot as ordinarily made it is clumsy. For parallel lines not falling within the range of the T aud set squares, the best tool, in the opinion of many, is the rolling parallel ruler. Thie is more quickly set to any two points, and more cleanly in uee than any otber form. A plain black ebouy one is beet for general use. A set square and straight edge are used hy many, but they more easily get out of place and soil the paper. Set squeres and T-squares shonld be Frenoh polished, and then they can easily be cleaned.—*Technologist.*

American Machinee in Holland.—The first American eteam-engine in Holland wae eent there some six months ago. The firm whioh received it has since ordered seven more; and, says the *Moniteur Industriel Belge*, American engineo are competing with English ones not only in Holland, but all over Europe, and not with Euglish engines only, but with all European makes, so that it seeme as if American engineo would soon be found in all European markets, while no European engines will be found in any Americen market.

SCIENTIFIC PROGRESS.

Watering With Chloride of Lime.

Galignani's Messenger, of July 15th, esys tbat in a paper read tn the Academy of Sciences, M. Houzeao states tbat for several years he has been calling the attention of the public in his lectnres on the important application the chloride of lime thrown away as waste by the manufactnrers of pyroligneous acid around Rouen might receive in watering streets. Experience, he says, has confirmed his opiuion. During the last few years this kind of irroration has been introduced into that city with excellent effects, and M. Houzeau thinks it ought to be extended to Paris, at least on the larger public walks, such as the Loxembourg, the Garden of Plsnts, etc. He remarks upon the insofficieney of tbe watering observahle on a Snnday in one of those freqnented places. The ground gets dry very rapidly under the feet of the crowd, and all this populatiou of pleasure-seekers is soon immersed in a dusty atmosphere, which is as disagreeable as it is detimental to health. The fine particles of siliceous matter floating in the air penetrate into the respiratory organe, and causes irritation capable of eggrevating pulmonary complaints already in existence, especielly among children, or retarding oonvalescence. The same may bo seid of certain diseases of the eye. Now, watering with chloride ot lime causes these drawbacks to disappear. It impregnates the soil with matter attracting moisture, which retains a wholesome moisture for a week. Consequently, there is no more duet; the wind can exercise no action on a soil dampened with chloride of lime. This system of irrigation is both saluhrioos and economical. The chloride of the pyroligneous acid manufactories alwaye contain some iron and tarry particles, the diepersion of which in the air cen only he conducive to health. This irrigation is also more economical by 30 per cent. than watering with pure water. On a surfece one kilometre in length and five metres hroad 16 cnbic metree of water are poured in a day at a cost of 10 francs. Tho same surface will only reqnire four cubic meters of the solntion of chloride, at a cost of only seven francs and fifty centimes a day.

Instinct.

Professor Hammond, of New York, relates many instances of instinct in animals: If the entire brain he removed from a frog, the aoimal will continue to perform those fnnctions which are immediately connected with the maintenence of lite. If the web between the toes is pinched, the limb is immediately withdrawn. If the shonlder be scratched with a needle, the hind foot of the same side is raised to remove the instrument. If the animal is held up by one leg, it struggles. If it is placed on its back, a position to which frogs object, it at once turns over on its belly. If one foot is held firmly with e pair of forceps, the frog endeavors to draw it away. If unsoocessful, it places the other foot against the instrument and pushes convulsively to remove it. Not succeeding it writhes the whole body from side, and always in a forwnrd direction. All these, end even more complicated motions, nre performed by the decapitated alligator. I have frequently seen the headless body of the rattlesnake coil itself into a threatening attitnde, and, when irritated, strike its bleeding trunk against the offending body. On one occesion e teamster on the Western plains had decapitated one of these reptiles with his whip, and, when bending down to exsmine it more oarefally, he was struck full in the forehead. So powerfnl was the shock to his nervoos system that he fainted, and remained unconscious for three minutes. A natural historian relates that a viper whose head had been cut off moved determinedly toward its hole in the wall.

Experimente on American Coals.—The National Academy of Sciences hae prepared a memorial to Congress, asking for a continuation of Prof. W. R. Johnston's extremely veloable experiments on American coale (made eome 25 or 30 yeers ago); the intention of the intention of the memorialists being to have the investigation extended to the coals of the Mississippi, and those of the coontry beyond, to the Paoific coast. The principle plea of thie memorial is in behalf of the national protection and the demande of the U. S. army and navy; bnt the seoondary one, in the interest of manufactures and commerce, would present n mnch stronger claim upon the government. Fuel is the primary necessity of modern civilization—the hasis of modern industry, and the development of the resources of the coontry by iovestigation, under national direction end authority, is an unquestionable duty of Congress. No one of the numeroue statistical publications, ever mede by the authority of the United States, has had a larger quotation, or been more practically useful in the arts and eciences than this report of Prof. Johnson, and an equally thorough document embracing the fuel and full resources of thie country would be appreciated in ell lande.—*Jour. Franklin Institute.*

A Russian scientific congress is appointed to meet at Warsaw next September, at which the question of adopting the Gregorian calendar will be cousidered.

Classification of Clouds.

Whenever, on account of some topographio circomstances, the snn beats any locality on the enrface of the earth more than the sorrooniing region, a gentle cnrrent or colnmn of heated eir rises, and its invisible moisture is condensed into small masses of clonds called *cumuli*, which spread and produce the mottle appearance commouly known as "mackerel sky."

But when, as is frequently the oase in summer, a valley, or plain, or island, or any other place, is much more highly heated by the sun than the snrrounding region, the heated air over soch locality rises more rapidly and with more ascensional momentum; and, as it reaches the higher and coolsr regione of the atmosphere, its moistore is condensed into large rounded volumes, or mountain-like masses of *cumulus* cloods. Suoh *cumulus* clouds always precede and charecterize a local sommer etorm or shower.

When the warm horizontel corrent from the south, as in winter, mests with the cold corrent from the north, it slopes upward over the cooler onrreut, and forms stripes or bands of *stratus* clouds along the horizon.

These *stratus* clonds indicate to the observer the fact that a werm current is northward.

When in summer a oool current is moving southwerd, it encounters the werm equatorial or tropical current, whioh again glides upwards and over it, and forms horizontal bands of *stratus* cloods along the opper line of oontact, es in winter storms; hut, in addition, the denser oold air from the north, moving with more momentnm, will lift up the warm end satureted air from the tropics, and its moisture will be condensed into masses of *cumulus* clouds banked up egainst the top of the old current, and arranged over the horizontal *stratus* clouds. Thus is produced the oombination of *cumulo stratus* cloud, whioh is characteristio of progressive sommer storms.

To the tornado clood produoed by a whirl of air, and resembling en inverted cone, Prof. Blasius gives the name of *conus*, which is both distinctive and appropriate.

These four typical clesses of clouds—viz, *cumulus*, *stratus*, *cumulo-stratus*, and *conus*—indioete and characterize the four different olasses of storms.—*Popular Science Monthly.*

Water in Coals.

At the last meeting of the Americen institote of mining engineers, a paper was read by J. B. Britton, giving the following as the result of meny experiments:

1. That water exists in several classes of ooal in two conditions, i. e., combined end uncombined, but in these conditione not constent in relative proportion.

2. That some coals will and some will not, irrespective of the class to which they belong, when finely pulverized and left open to the air gain in weight by taking oxygen, while et the same time they lose in weight by losing water and hydrocerbons, at temperatures varying between that of boiling weter and one that is sofficient for destroctive distillation.

3. That all coals when deprived by heet of any portion of their normal weter, will, upon exposure to the open air at common temperature, immediately begin to regain their loss. It therefore follows that oorrect weighing ceunot be doue with the material uninotosed.

4. That the metbod of determining the water by merely finding the loss which the ooal sustains by drying for one hour at 212° Fah., or for any length of time or at any temperature, whether over eulphuric acid or not, gives falteioue results.

How to Burn a Diamond.—In the ordinary experiment of borning a diamond in oxygen the diamond hae to be raised to its firing temperature by meane of the oxyhydrogen blowpipe. The procese ie eomewhat troublesome and not wholly without danger. Besides, the employment of very small fragments is prevented, as these cnnnot be easily handled io the blowpipe jet; and they readily go out again on heing introduced into the vessel of oxygen. These difficulties, eaye M. Blinder, of the German chemical eociety, may be evoided hy employing magnesium. The diamond ia pot on a emall piece of magnesium ribbon, and thie in en earthenware capsule, whioh ie then throet into a combnetion-tnbe about 200 mm. in length, and which is connected with a gaeometer. From the letter a current of oxygen is passed throngh the tube into a veeeel of lime water ontil the air is driven out. The part of the tube where the diamond is is then heated with the flame of a Bunsen burner. Soon the magnesium kindles aud inflames the diamond, which, with moderate admission of oxygen, slowly burns, while a precipitate is formed in the lime water. Whenever the magnesiom takes fire the Bunsen burner ie removed. Foliated graphite (from Ceylon), treated by this method, does not burn; thus confirming Roee's observation that this suhetance is less combostible than the diamond.

Purification of Oils.—A procese said to be employed with succees in Englaud, consists, instead of agitating the oils by mechanical meane, in agitating it by foroing a stream of air throngh it hy means of a syetem of perforated pipes at the bottom of the containing vessel. Sulphuric acid is cautiously added to the oil during the operation, and the remainder of the process follows the usual oourse.—*Polyt. Notizblatt.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

The Advance.—Alpine *Chronicle*, Aug. 12: The new hoisting machinery at the Advance works has been put up under the supervision of Wm. Mercer, and is now running very satisfactorily. The new works are sufficient to work the shaft at a depth of 1,200 feet; the new building is roomy and substantially built, and everything is now in good trim for pushing the work of sinking.

The I X L.—The new pump is freeing the shaft of water at the rate of 18 feet during the night, the daytime being occupied in lowering the pump and placing it in position. The depth of water in the shaft is now about 75 feet. The lower tunnel is being cleaned out, and stoping is going on in the upper tunnel, from which very rich ore is being taken. Next week the water will be out of the shaft, the new cage will be put in and drifting for the ora chute will be prosecuted with energy.

AMADOR.

Large Mill.—Amador *Dispatch*, Aug. 19: The Phœnix quartz mill, at Plymouth, is now running 80 stamps—the last 20 having been put on some two or three weeks ago. This is now the largest mill in the county, and we understand that the rock crushed from the mine continues of a good quality.

Pennsylvania Mine.—The mine, situated near Drytown, is soon to be started up. It is on the same lead, and adjoining the Gover mine, which is now one of the best mines in the county, and there is every hope to helisve the Pennsylvania will be equally fortunate.

BUTTE.

First Run.—Oroville *Mercury*, Aug. 10: Some weeks agn we gave nntice that a 10-stamp mill was being put up on the Deadwood quartz mine, near Forbestown. The principal part of the claim is owned by Mr. Roberts. On Saturday the gentleman was in town with the gold that he had taken out. He had run nine days and cleaned up 63 ounces, seven and a half pennyweights. This gold is worth $16.50 per ounce, which would make the whole come to $1,050. The mill crushed between 70 and 75 tons of rock in the time. This, it will be recollected, was done by new machinery. There was no hurry about working the mill, neither was the rock picked. The test that was made was a very fair one in every respect. Mr. Roberts is now desirous of sinking deeper on the ledge, and for this purpose will need a pump. He feels confident that he has a paying ledge and one that will last.

CALAVERAS.

Mill at the Duryea Claim.—Calaveras *Chronicle*, Aug. 19: The work of putting up a mill at the Duryea gravel mine, in Chile gulch, has been commenced and is progressing rapidly. The battery is to consist of five stamps, to be run by water power. All the gravel taken from the mine is to be put under the stampe before it is washed, an operation that it is thought will largely augment the yield. Heretofore considerable difficulty has been experienced in separating the gold from the gravel by the ordinary method of washing, owing to the quantity of cement contained in it, and undoubtedly a good deal of the glittering ore has been lost in the tailings. When the battery is put in motion that trouble will be obviated and all the gold saved. The mill is being erected under the supervision of Mr. John Rider.

Pump Broke.—Just as everything had been got in tip-top condition for sinking the shaft in the Lamphear mine the pump broke. Operations will have to be suspended until a new pump can be obtained and put in.

Contract Let.—Messrs. Rigney, Kelly & Co. have taken a contract for "breasting out" 5,000 car loads of gravel from the Duryea claim, in Chile gulch. The drifts are already run and the breasts opened, so there is nothing to interfere with the mining of the gravel. We understand that the contractors are to receive 40 cents per car load.

Upper Country Mining Items.—We have the most flattering intelligence from the Josephine mine at West Point. Splendid rock—ore that will mill $100 per ton—is being taken out, and the ledge is fully three feet in width. The rock comes from the stopes of the 100-ft level. The prospects of the mine were never before so favorable, and work is being energetically pushed. The mill is in readiness to commence crushing and the stamps will be set in motion next Monday morning. A new superintendent—Mr. Fulton, an old and experienced miner—has recently taken charge of the mine. Reports from the Champion are altogether favorable. A crushing of first grade ore is on the dumps, and hauling to the mill is to be commenced immediately. Good rock is being mined. The Mina Rica continues to produce rich quartz. No diminution in the quantity or quality of ore extracted. Work has been commenced on the Glencoe Consolidated, at Mosquito. Sinking a shaft is the first thing in order, and we understand that a force of hands have been employed for that purpose.

FRESNO.

The New Diggings.—Cor. Visalia *Delta*, August 19: Having arrived at Mill creek we began prospecting for a claim, but we saw notices on all the ground for miles up and down the creek, so we took the privilege to pan out dirt on other people's claims, but did not dig over a foot deep, but even at that depth seldom failed to find gold. The top dirt is nothing but loose sand amongst the bonders, which are large and numerous. Having traveled up and down the creek for, I should think, five or six miles without finding any vacant ground, and being informed that it was located for fifteen miles higher up, we returned and panned out ground from a side ravine, and got forty-three "colors" to a pan; another had thirty-eight; both were from the top. We panned out several more, and traced it up to the top of a red hill north of the creek. We then went and tried another creek, and found gold; and that creek looks quite as favorable for diggings as Mill creek, and I think will be easier worked. As we were washing a pan of earth Mr. William Works passed us and told us about his claim (which is the discovery claim) and showed us his gold, about fourteen dollars, which he took out before breakfast, as he has but little water and cannot wash over two hours at a time, and has but one sluice. One piece, he said, weighed nearly ten dollars; it seemed to have been rolled a long way, and had red dirt in its cavities, showing that it came from those red hills. We went to see his claim, and were surprised to see so small a hole. A good miner could dig as large a hole in favorable ground, in two hours; yet I was told that he had taken about one hundred dollars out of it, some of the nuggets weighing about twenty dollars. The ground on the bedrock, in his hole, looks first rate; the hole is three or four feet deep.

INYO.

Lee District.—Coso *Mining News*, Aug. 12: The Twilight mine, 200 feet west of the Cactus, shows a body of ore 10 feet wide. The Laguna mine is 250 feet from the Valentine. A shaft 38 feet deep has been sunk upon it. The wall is clear 30 feet and the ore body was struck showing the same kind of ore as that in the Valentine. The Cactus mine is looking better every day, and the mill is kept steadily at work on good ore. We understand that the Emigrant company are about putting up a 15-stamp mill at the mine without delay, which will warrant an immediate shipment of bullion to San Francisco and enhance the value of the stock. This is one of the mines in Inyo county that we have implicit confidence in, and we are willing to stand or fall by its developments.

Coso Con.—This company, having made arrangements with the Defiance company, are now at work smelting its ores in the Defiance company's furnaces. The contract, as we understand it, is to smelt 300 tons of ore, in such quantities as the Defiance can reasonably afford to smelt, not interfering with the working of their own ore. The working, so far, of the Coso Con. company's ore is a perfect success.

MARIPOSA.

Confidence Quartz Mine.—Mariposa *Gazette*, Aug. 19: This valuable mine, situated on Fresno river, about four miles below Crooks' ranch, has again been heard from. Mr. Floyd Dodds, one of the proprietors, was in town on Monday last, purchasing powder, fuse, etc. He presented us with a rich specimen of rock, taken from the bottom of the shaft, which is 100 feet deep, and shows a well defined vein of good pay rock four and a half feet thick. The specimen given us shows considerable free gold and galena sulphurets. The company have grinding select rock, taken from the dump, in an arastra, which pulverizes about five tons a week, which has yielded $1,000 per month for several months past. They are likewise running a tunnel, which is already in 150 feet, with 100 feet further to go before the vein is reached. This will give a lift of 200 feet on the vein. The company is conducting the work and the management of the mine in a judicious manner—compelling the proceeds of the mine to pay the expenses of developing and extracting the ore therefrom. This is the correct principle. If a quartz vein is valuable, as many are supposed to be, it will, by proper management, sustain itself by commencing with the simple process of an arastra. The celebrated Hite mine, which is now running 40 stamps, first commenced operations with an arastra.

NEVADA.

Lone Jack.—*Foothill Tidings*, Aug. 19: Rumor has it that this mine, lying between the Omaha and Homeward Bound, adjoining each, which turned out $600,000 when last worked, and was laid by, temporarily it was then supposed, because the machinery failed in its capacity to drain it any deeper, is soon to be started up and systematically worked.

Homeward Bound.—This mine, which is situated between the Omaha and Franklin, Allison ranch, and from early since working, shone as well as either of these now prominent mines, is steadily advancing with the work of development and in the estimation of the public. A double handful of decomposed quartz and dirt grabbed up at the foot of the new winze, now completed to the main drift, was taken up and panned out this week, and the result is before us in the shape of scores of fine "colors." The pay chute at this point, shallow as it is, is over 20 feet in length, and several other chutes are known to exist. Taking into consideration the fact that the Omaha, on the same ledge, the stock of which not many months ago sold for assessments, but now commands readily $75 per share, had no percentage of preference over the Homeward Bound in the estimation of old residents in the vicinity, who knew both when lying idle and undeveloped, coupled with the further fact that the machinery on the mine is capable of draining and hoisting to a depth of 1,000 feet if need be, and we have a pretty good lookout for H. B. No wonder a prominent stockholder, an old owner therein and not given to blowing, offered this week to lay a thousand shares against any other man's thousand, that when the mine is opened by shaft to the depth of 500 feet, and drifts run a hundred feet each way, stock in the Homeward Bound will be worth intrinsically $20 per share. A more sanguine man, standing by, put it at $50. There are scores of mines, all about Grass Valley district, which only require opening up to make them pay largely.

The Yuba mine, above Washington, is soon to receive an addition to its mill capacity. The company have lately overhauled the old 10-stamp mill, putting it in complete order and built a large overshot wheel. They now propose putting in 15 additional stamps, with amalgamating facilities in proportion. Mr. Lord, the superintendent, tells us that the timber and lumber for the new work is now being delivered, the carpenters are engaged and all will be finished at an early day. When this is done and the Yuba has 25 stamps pounding away on vast bodies of ore at command, it will, in our opinion, soon show itself, what the best posted ones have all along claimed it would be, second only to the Idaho as a regular dividend paying mine.

Franklin, Allison Ranch.—This enterprise is jumping ahead rapidly, and though only a few months since it began to attract attention it is destined soon to stand among the dividend payers of the district. The main shaft will soon be down to the 150-level, from which drifts will be run, and from prospecting already done above it is known that a large amount of splendid ore will be then ready for extraction. A 20-stamp mill formerly belonging to the Hope mine, near Forest Hill, Placer county, is being put up in this mine.

PLACER.

Gold Run.—Placer *Herald*, August 19: We learn from parties from this place that six hydraulic claims are yet running in that district and most of them, it is thought, will continue washing for at least a month yet. The Indiana Hill blue gravel claim, which for several years has been a good paying mine, we are pleased to learn keeps up its lick. The last clean-up gave a return of about $1,000 for each week's run.

Cement Claim.—The parties who are opening an old cement claim on Lowell's ranch, not far from Georgia Hill, on the Forest Hill divide, as mentioned by us some time ago, have their hoisting works completed and the water pumped out, and find the prospect very encouraging. They are going ahead at once to put up a crushing mill, on the completion of which they expect to take out big money.

A New Quartz Mine.—The Seaton mining company, which incorporated only a short time ago, are at work on the Scaton quartz mine, at Bath, under the superintendency of P. Powell, and encouraged by very favorable indications, are performing their initial labor with a view to large works. This claim is supposed to be an extension of the Hancock ledge, now worked successfully by Dewey & Burt. Some work was done on the Seaton about twelve years ago, and the top rock crushed at that time yielded $15 per ton. This, in connection with the fact that the rock shows better as they descend encourages the company to believe they have a good mine. The ledge is a good size and well defined.

The Divine.—Our latest information from the divide, is to the effect that the Weake claim, near Michigan Bluff, which lay so long dormant owing to legal controversies, is now being worked systematically, and is turning out the gold as in the days of old at a rate that is altogether encouraging. The Tickell boys, we also learn, have struck gravel, and will soon have their mine in shape for working profitably. At the Hidden Treasure everything is being prepared for extensive operations.

Mining Items.—Dutch Flat *Forum*, August 17: The Polar Star, Franklin and Lekamp claims continue washing a few hours each day. The Elmore Hill claim has finished cleaning bedrock, and is shut down for the season. The Yankee tunnel is still being pushed ahead with vigor. The tunnelers last week worked twelve shifts, fired ten face shots and advanced 45 feet. The Baker shaft is still going down. It was sunk ten feet last week. At Gold Run the Indiana Hill and Cedar claims continue washing.

New Reservoir.—The South Yuba Canal Co. intend to construct a distributing reservoir, in a small valley above Alta, on what has been known as the Godiug ranch. Bids for constructing the dam were opened at that company's office in Nevada City last Saturday, and the contract was awarded to Thoe. Hughes, of that place, who has been recently engaged on the Nevada narrow gauge railroad. We are informed that the price for the whole is $5,333. The work to be completed in ninety days.

The Bisbee Mine.—This mine is located about one mile from Colfax, and is undoubtedly the best paying quartz mine in Placer county. This conclusion is arrived at because it is the only one that pays regular dividends; the eighteenth will be declared for the present month. One of the greatest reasons for its good showing is because it is run strictly in the interests of the stockholders, and not for stock jobbers. Through the politeness of Hon. J. H. Neff, the Superintendent, we had the pleasure of taking a look at the mill, the mine and the surroundings, on Friday last. The mill is complete in every particular, no money having been spared to make it so. It contains three fine engines, which are driven by steam power, and are used for the hoisting works, pumping, for the stamps, and for other machinery in use in the mill. Forty-five men are in the employ of the company constantly; two shifts of men are worked in the mine, but the mill is run only in the daytime. The shaft is down now 640 feet and the quality of rock taken out is equal to the best yet taken out of it, and the indications are that the value of the rock in the ledge is increasing rather than decreasing; and from the prospecting which has already been done it is believed that the ledge is very extensive and will last a great many years.

PLUMAS.

Providence Hill.—Plumas *National*, August 19: Mr. John Smith, Superintendent of the Providence Hill Co.'s works, was in town the other day, and informs us that the mine is looking first-rate, and what is better, is paying well. A small clean-up of 100 feet of flume last week panned out ninety ounces, and as they have two long flumes and four undercurrents to go through, it looks as though they would make a good season's run. They have an abundance of good ground, and the claim is well fitted up for work.

The Bell Ledge.—The tunnel which is being run to open this ledge is showing some fine looking rock, and what is more important, it is paying rock. A cross-cut is now being run at the head of the tunnel and some six or eight feet of good rock shows. The header is about 80 feet from the surface, and the gold is coarse. The company will probably put up their crushing machinery this fall, and commence operations in earnest.

Franklin.—We are credibly informed that a San Francisco firm have made arrangements with the Franklin company, whose claims are located on the blue gravel range on Willow creek, to put up hoisting machinery and flush prospecting the mine, for an interest in the ground. The shaft sunk by the company last summer and fall is, in all probability, nearly down to gravel, and we think it safe to say that a few days' work after the new machinery is up, will develop as fine a mine of blue gravel as can be found in the State. We are glad to see this work go ahead, for we consider this section a very important one, and look for a big mining camp on Willow creek at no distant day.

Novel Mining Operation.—It has always been well known by many old miners that the bed of Feather river, above Oroville, was very rich in gold, but the cost of drying the river bottom has always been in the way of a successful working. A company composed of many of the best citizens of Oroville have organized, and propose to try an experiment in the mining line. The bed of the river is filled up with sediment to the depth of twenty or thirty feet. A large working shaft is to be sunk on the bank of the river, deep enough to go below the bed of the stream. From this shaft a tunnel will be run, slightly inclining upward, to tap the river bottom, and then the bed is to be worked by a system of tunnels. It is thought that the sediment will be sufficiently hard to hold the water out, and what gets through will drain into the shaft and be pumped out by a large engine. If it works, as there is reason to suppose that it will, the company have got a wonderfully rich claim. The expense of the venture is estimated at $30,000. We hope it will succeed, as there are many places which might be made profitable by this new system of mining.

SIERRA.

Nuggets.—*Mountain Messenger*, August 19: There are several fine specimens of gold dust in Scamman's bank, which came from the diggings of Philo Haven, at Gold lake. The largest one weighs 53 ounces and is worth over $900. A number of others weigh from 8 to 15 ounces. He has taken out between two and three hundred ounces this season. It is beginning to be apparent that the fellow who told such wonderful stories about Gold lake was not such a lunatic as supposed, after all.

SISKIYOU.

Opening.—Yreka *Union*, August 19; Bean & Co. are getting along with the work of opening their claim in the Klamath river, near Scott bar, and will soon be down to the gravel. They have got their dam in, and the work of pumping out the claim has commenced. There is very rich pay in this claim if they can only find the channel. Last year they were quite late, owing to one mishap and another, getting in, and they did not find the pay channel until about a day or two before the water rose and drove them out. As they know where they struck it last year, they will be apt to find the pay very soon after getting in this year.

Opening.—Kittlewood & Co. completed their dam in Klamath river, near Scott bar, last week, and got their wheels and pumps in good shape. Their claim is doubtless pumped out by this time and so that they are now looking for the pay channel. This claim has paid largely during the past two seasons, and there is hardly a doubt but that it will pay equally as well this year.

TUOLUMNE.

Lucky Miner.—Tuolumne *Independent*, Aug. 19: Bias L. Radonich, one of the best and luckiest pocket miners in this county, has taken out of his claim the past two days three pounds of beautiful gold. The claim is situated on Bald mountain, near Brown's flat, and is the same lead owned by "old man Patterson" in '57, and about 150 feet from the place where the old gentleman took out a $30,000 pocket; and afterwards Antone Violich took out at three different times the snug little sum of $8,000. Bias being on this vein, and in close proximity to this almost fabulous wealth, is likely to take out several more pounds the coming week, as he has a right in the door for a bigger "take" than before.

The Melonsa Mine, at Robinson's ferry, is about to be adorned with a 10-stamp mill and hoisting works, to be erected by J. K. Owens. The vein, which runs into Carson hill, and has been lying still for 10 years, is very rich. Since last January, Harvey Woode, the superintendent, has picked out and shipped by express rich pieces enough to amount to about $2,000. There are 400 tons of good milling ore on the dump.

The Jones & Woodman.—This mine at American camp is looking splendid. The company (incorporated) are putting up a mill on the claim and will work the mine on an extensive scale. From their vein, three tons of rock, sent below recently, yielded $1,233, or $411 per ton. The vein improves as they go down on it, and is now from three to four feet thick. Parties who have just located an extension are in ecstacies over their prospect of a fortune.

The claim of Messrs. Daniel Hennesey & Co., on the west side of Wood's creek, at Saw Mill flat, is proving exceedingly rich. They have gone down on the chute 25 feet below their tunnel, and gold can be seen in every piece of rock they take out. The chute has been worked six feet in width, but how much wider it is has not been proved, as they have been sinking instead of driving ahead to find out the full extent. All the rock in sight, and from the tunnel down (25 feet) is thickly mixed with gold, and the chute from the top of the tunnel to the surface—100 feet or more—is undoubtedly fully as rich. They have been working the claim over four years, and have found many rich places in the vein, but the present working is developing a chute which promises to be permanent as well as of fabulous richness. The vein varies from two to 10 inches thick. The owners give no figures of the yield, but rumor places it all the way from $1,000 to $10,000 within a week. Parties who have been in the mine examined the vein, showing gold sticking out on all sides not yet broken down, and estimated the amount of rock removed, say that it would take a very large sum to exceed their belief.

Idaho.

Owyhee County Prospects.—Cor. Idaho *Statesman*, Aug. 19: The aspect is gloomy indeed, but there is still a gleam of hope that business will yet revive before hoary winter comes upon us. If not, we are wretched indeed. There is a fair prospect that the Golden Chariot, South Chariot and Mahogany mines will resume work ere long, and a possibility that the Oro Fino will also resume. Should these probabilities become realities, a material chance for the better will be marked for War Eagle mountain. South mountain will doubtless be revived after the sale of the property of the S. M. C. M. Co. takes place, it being advertised for sale on the 4th of September. There are valuable mines there, as well as on War Eagle mountain, and all that either will require to become paying camps is honest and economical management in future. But the most reliable hope for this county is unquestionably in what is called the Wagontown district. This new camp has been laboring under the depressing effects of an incorporated company without money, or if it possessing money they were also endowed with an unwillingness to spend it, as they, after a short run, ceased paying cash, resorting to the expedient of 30 day drafts, that were finally dishonored, and the works stopped. Had there been no Maggie mine, the reputation of the district would have been better to-day than it is. The great want of the camp has been mills. That want is about to be partially supplied, as Adams & Jones are about to remove a quartz mill to the camp. This will enable the place to support about 150 men from this time forward. The population of Wagontown camp is now only about 60. If Owyhee county ever rises to respectability again, it will be on its own merits, and will have a permanent standing as a good mining district. For the days of wildcat skulduggery are past, and honesty must come to the front.

Nevada.

CORNUCOPIA DISTRICT.

Dull.—Cor. Eureka *Sentinel*, Aug. 16: In regard to the camp, I can tell you that it is very dull; still every man who is on the work is at work, and even last week they were looking for men and could not get them. The Leopard will ship more bullion this month than it ever did before for any one month. This week it will ship over $40,000. There is a good deal of talk of a mill being put up at Tuscarora. I hear of two new stores going to start here within a week or two. After another pay day we expect times to get better here, but up to the present business has been very dull.

HUMBOLDT DISTRICT.

Specimens.—*Silver State*, Aug. 15: We were shown some specimens of ore yesterday from the Byron ledge, in Humboldt district, owned by Messrs. Knnkel & Buck, which excel anything we have ever seen from a mine in this county. One of the specimens, of which there were three, which would weigh over a pound, was spangled on all sides with gold. The ore contains considerable silver, which gives it a bluish tinge, and the solid character of the quartz peculiarly adapts it to the purposes of the lapidary. It would make the finest kind of jewelry, with gold, silver and quartz in about equal proportions.

EUREKA DISTRICT.

The Hoosac.—Eureka *Sentinel*, Aug. 15: There is good reason for believing that Billy Wermuth will succeed in getting the affairs of the Hoosac once more in practical working shape. Mr. Wermuth has spent much time and money on negotiations looking to this end, and the whole community will join heartily with us in wishing that his efforts may prove successful.

Jackson Ore.—There is some talk that one of the Eureka Consolidated furnaces will shortly start up on Jackson ore. We hear much talk on the street, but have not had an opportunity to interview either Superintendent Donnelly or Shaw to ascertain its correctness. It would be a good lick all around if the report should turn out to be true.

ELY DISTRICT.

Local Review.—Piocha *Record*, Aug 13: There is nothing new to chronicle in the way of mining operations during the past week. The prospect work in the Raymond & Ely continues with no improvement worth mentioning. The pumping machinery for the Meadow Valley continues to arrive almost daily. The hoisting works are approaching completion and will be ready to start about the 20th inst. or thereabouts. No work has been done in the American Flag for the past week. The Hubn & Huot and Washington & Creole still continue the work of extracting ore with good success. There has been no change in the Piochc. The work of sinking the main shaft still continues, the formation being the same as last week. The Alps mill will start to work to-day, the hands being employed yesterday in rigging the suction pump to save water. Prospect work continues in the mine with very fair prospects. The tailings of the Raymond & Ely mill at Bullionville have been purchased, but it is as yet undecided whether a furnace to work them will be built there or in Piocha, as ore will have to be purchased in Piocha to work the tailings.

Raymond & Ely.—The 8th, 10th and 11th levels are the principal field of operations, although in the upper levels chlorides are at work doing some little for themselves. The pump, as a matter of course, is not in operation, and not likely to be for a couple of months.

Meadow Valley.—A large amount of the pumping machinery for this mine arrived during the week and will now be brought in almost daily. The hoisting works are approaching completion and will probably be started up for trial about the 20th or a few days thereafter.

American Flag.—No work has been done on this mine during the past week. Awaiting the return of the superintendent, John R. James.

Huhn & Hunt.—Three men continue work on the Huhn & Hunt taking out ore, in which they meet with fair success.

Alps Mill.—This mill will start up to-day. Workmen were busily engaged yesterday rigging a suction pump to take the waste water from the reservoir back to the settlers, thereby saving about one-half of the water that would otherwise go to waste.

Nevada.

WASHOE DISTRICT.

Bullion.—Gold Hill *News*, Aug. 17: The long expected and much desired air connection between the 1400 and 1700-foot levels was accomplished last Sunday night. This connection was one of the most momentous importance to not only the Bullion but also to the Imperial Consolidated. It was a most difficult undertaking, and was carried through to complete success under very adverse circumstances. Two hundred feet north of the 1400-ft station of the main incline, a winze was started downward toward the 1700-ft level. At the 1700-ft level the Imperial sent a drift was started north and run a distance of 1700 feet to reach a point directly under this winze. This drift, although known as the 1700-ft level drift, actually cute the vein under the winze at a depth of 1850 feet, there being a difference of 150 feet in the altitude of the two shafts. To connect the 1400 and 1700-ft levels at that point it was necessary to construct an incline shaft 825 feet in length. Throughout the length of the 1700-ft drift and upraise from that level the thermometer ranged from 130 to 140 degrees, making it a most difficult thing for

men to accomplish even a very small amount of labor on a shift. Work was driven from both above and below, the winze from above and the upraise from below, meeting at a half way point. As soon as the opening was completed a strong current of air set down the Bullion shaft, and passing out through the drift on the 1700-ft level, ascended the Imperial shaft. At the time of the connection the thermometer stood in the drift at 138 degrees, and this morning it is down to 100 degrees, and is yet steadily falling. The connecting shafts are being enlarged and thoroughly timbered. Work was again resumed in the face of the north drift on the 2000-ft level this morning. Sinking the main incline is making good progress. As soon as the connecting winze is well secured end the 1700-ft drift has cooled a little more, prospecting the 1700-ft level and the ground intervening between the 1400 and the 1700-ft levels will be commenced in good earnest. A station has already been opened at the 1800-ft level, and men have been set to work again in the face of the north drift on the 1400-ft level. Prospecting and opening out on the lower levels is to be prosecuted with all the vigor possible from this time on. There is but little doubt that the Bullion will in a very short time begin to give a good account of itself. Superintendent E. A. Schultz deserves great credit for so successful a prosecution of the work, under such great difficulties.

Imperial Con.—Daily yield, 30 tons of ore. The ore is being crushed as fast as it is extracted and is giving good returns. The ore stopes on the 2000-ft level continue both to look well and yield a good quality of ore. The east cross-cut from the bottom of the north winze, below the 2000-ft level, is showing streaks of ore and quartz of a very favorable character. A drift has been started south from the winze. The south drift from the bottom of the south winze on the 2000-ft level, running to connect with the Yellow Jacket, is making steady progress. The new and powerful blowers have arrived and will be placed in position ready for service at the earliest day possible. The use of these blowers will expedite prospecting operations at the bottom of the winze, below the 2000-ft level, as well as benefit the ventilation of all the lower levels of the mine. The air in the main incline is being greatly cooled and benefited by the air connection recently made in the Bullion mine between the 1400 and 1700 ft levels.

Ophir.—Daily yield, 300 tons of ore, keeping the mills all running up to their full crushing capacities. The ore bresats throughout the 1600-ft level are yielding the usual quantity of good ore, with every promise of keeping up the same amount for many months yet to come. The east ore vein recently struck, and which we have heretofore described, is showing a steady and favorable improvement on the 1650-ft level. There seems but little doubt now that when the east drifts are extended a sufficient distance on the 1700-ft level they will cut the same vein. The course of this body of ore will carry it nearly 200 feet east of any point yet prospected on the 1700-ft level. The north drift on the 1600-ft level is steadily advancing, the face in porphyry. The west cross-cut, 200 feet south of the Mexican line, is also steadily advancing. The mine is steadily assuming a much better shape for working than it has been in before for yeare past.

Amazon Con.—The shaft is thoroughly timbered and in the best possible working condition to a depth of 331 feet. As soon as the depth of 400 feet is attained a station will be opened and a drift started to cut and prospect the ledge.

Twin Peaks.—The road to the mine, for the transportation of miners, wood and other requisite supplies, is nearly completed.

South End.—This is one of the most promising of the Silver City mines. It contains 1,500 feet of ground, adjoining the Goodman mine on the south. The title is a United States patent. The company own a portion of two valuable ledges, the Goodman and the Herald. The shaft is situated on a steep point of the mountain, just below the line of the Virginie and Truckee railroad. An incline has been sunk on the Herald ledge to a depth of 60 feet, the entire distance in quartz, rich in gold and silver. The location of this incline was such as to cause its abandonment for working purposes. A site for a new shaft was then selected by Mr. J. M. Walker. A comfortable hoisting works building, 22 by 40 feet in size, and a donkey engine, wes then erected, capable of sinking the shaft to a depth of 600 feet or more. The shaft is a two compartment, each division being four by five and a half feet in the clear, well timbered throughout, and has been sunk during the past two months to a depth of 170 feet, a rate of progress equal to the best work that has ever been done on the lode. W. T. Robinson is superintendent, and J. M. Walker & Co., the well-known stock men of San Francisco, are the principal owners.

Con. Virginia.—Bnt e emell amount of ors is yet being extracted. The shaft, however, is about completed to the 1550-ft level. The drifts and stopes on the 1550-ft level are ell being pnt in first-class condition for extracting ore whenever it ie desirable to do so. The prospecting of the ore vein further to the southward on the 1500-ft level ie going steadily forward. On the 1700-ft level the breakege of the diamond drills proved to be much more serious than was at first supposed. The damage will, however, be repaired and everything he put in good running order in a few days more. The C. & C. shaft is down 75 feet below the 1500 ft level, the hottom etill in hard blasting rock. The flow of water continues at the rate of 40 inches per day, end ie easily handled by the pumps, although it greatly impedes the sinking. It ie the intention, when a depth of 75 feet more is attained, to again open a station and stert a drift to cut the ledge. This drift will cut the ledge at about the 1700-ft level in the old shaft. The erection of the new amalgamating mill is steadily approaching completion, a large portion of the pans and machinery is already in place, the building is nearly completed and the engine and the rest of the machinery is already on the ground.

Gould & Curry.—The foundations for the new pumping machinery are being laid rapidly. Cutting out for the new pump station and repairing the shaft at the 1500-ft level is still going steadily though slowly forward. The cley wall at that point is of immense thickness and weight, and is constantly flaking off and giving way in such a mauner as to greatly impede the progress of the repairs and the erection of the pump tanks.

Savage.—The new machinery is not yet reedy to start up and probably will not he much before the 1st of September.

Sierra Nevada.—The new station at the 1700-ft level is almost completed, ready to start the main east cross-cut toward the ledge.

Yellow Jacket.—Almost the entire week has been occupied in timbering the drifts connecting the north and east winzes, and the south drift from the hottom of the east winze on the 2040-ft level. The timbering ie about completed.

Mexican.—This northeast cross-cut on the 1465-ft level is steadily advancing, the face in qnartz end ore.

Hale & Norcross.—The attaching of the pipes and finishing of the huge pumping machinery on the surface has taken e longer time than was expected, and everything will probably not he ready to steam up much before the 15th inst. The pumps are all in place ready to etart up.

Prospect.—The station at the 400-ft level is about completed ready to start the diamond drill to prospect the ledge. The drills will he steadily at work prospecting the ledge at thet point in a day or two more.

Cosmopolitan.—The prospecting and development work is going ahead lively at the various points, and considerable good pay ore is coming from the upraise near the northern end of the main adit tnnnel.

Utah.—Sinking the shaft ie meking steady and favorable progress. The rock in the hottom is not quite so hard and the work is being pushed ahead with great vigor.

Chollar-Potosi.—Daily yield, 110 tons of ore. Sinking the combination shaft is making excellent headway.

North Carson.—Work going ehead as usnel, with no new features of interest to report.

California.—Daily yield, 700 tons of ore, keeping the mills all steadily running. The ore breasts ere showing magnificently at all points; in fact, the mine never in the past put on the splendid appearance that it does now. At no point where the ore breasts have commenced does the ore fall helow the most sanguine expectations in richnese, and at no point is there any trouble whatever in separating or assorting the ores, the whole heing of such uniform richness as to justify its extraction. On the 1650-ft level the south drift has heen extended a distance of 125 feet, running through the center of the ore vein in ore of the same character as that found on the levels above. On the 1400-ft level cross-cut No. 2 is steadily advancing in a much better description of ore than has yet been found in that portion of the mine. The new battery mill is steadily approaching completion, everything heing in place, and the batteries heing almost ready to fill in with broken quartz, preperatory to commence crueb-ing.

Lady Washington.—The hottom of the shaft continues in very favorable quartz. It is very firm, with good streake and hunches of low grade ore, and is liable at any moment to develop into a good body of pay ore.

Justice.—Daily yield, 110 tons of ore. The ore breaste look well and are yielding good ore. The Douglas mill is added to the crushing capacities of the mine. On the 900 ft level both cross-cuts Nos. 1 and 2 are showing evident indications of a near approach to the ore vein, and there is now but little doubt that both drifts will strike the same rich ore body found on the levels above.

Belcher.—Daily yield, 350 tons of ore, keeping the mills steadily running. The prospecting drifts south and east on the 1600-ft level are steadily advancing with favorable ore indications.

Overman.—Sinking the main ebaft is going steadily forward without interruption or hindrance. The flow of water is still strong at the hottom of the shaft. The preparation for the erection of the large and powerful pumping engine is going rapidly ahead.

Herald.—The incline shaft down 85 feet, a drift north from this point has been run a distance of 20 feet presenting well defined clay casings and a vein of good ore. At a depth of 65 feet, another drift south has heen run a distance of 10 feet disclosing a vein 2½ feet wide of very rich ore. An average milling test of twenty tons yielded $52 per ton, enough to nearly defray the expenses of the development thus far.

Superior.—Getting in new hoilers at present. Ae soon as thie ie done the station for a drift or cross-cut at the lower level, through the vein, will be opened.

Niagara.—The main incline is down 430 feet, the material in the bottom being much softer and the sinking making excellent progress.

Trojan.—The mine has passed into entirely new hands. The old debts have all heen liquidated, and everything put in the best possible working condition. Work will be commenced and prosecuted at all points in a day or two more, with all possible energy.

Silver Hill.—Sinking the main incline is going steadily forward without interruptiou, the flow of water is not quite so strong, hut the rock is very hard.

Buckeye.—The north and south drifts on the 550-ft. level are still advancing, the face of each being in fine quartz and low grade ore.

Baltimore and American Flat.—A new station at the 1,450-ft. level is being opened preparatory to drifting toward the main ledge at that point.

West Belcher.—Both the up-raises in the west and northwest drifts have reached the ore, which is of a good milling quality. Shutes and other conveniences ere being arranged for extracting the ore for milling.

Alta.—Sinking the main shaft ie going ahead at a very rapid rate. During the past week the shaft has heen sunk and timhered a depth of 25 feet. The new pumping engine appeare to be all that its most senguine friends claimed.

Julia.—Nothing bas heen done in the mine for the past week. The time has heen entirely taken up with necessary repairs to the machinery. The repairs ere, however, completed, and work wae resumed at all points in the mine yesterday.

Ward.—The shaft has heen enuk and timhered during the past seven daye a distance of 40 feet, making a total depth attained of 465 feet.

Union Consolidated.—The north drift on the 1300-ft. level is still advancing, the face in clay, qnartz and porphyry mixed.

Sutro Tunnel.—Total length of tunnel, 13,980 feet. The material at the face of the header is porphyry and limestone, rather hard, hut blasting well, allowing of excellent progress heiug made.

North Consolidated Virginia.—The drain tunnel has nearly reached the shaft and will hs completed in a day or two more.

Best and Belcher.—Taking out the old pumps in the main shaft, and retimhering and repairing the same. Nothing doing of any interest on ths 1700-ft. level.

Crown Point.—The main south drift on the 1700-ft. level is steadily advancing in the Belcher ground to connect with the new air ebaft.

Centennial.—Excellent progrees is heing made, and sinking the main shaft ie soon to he resumed.

Caledonia.—A station is heing opened and pumpe put in at the 1150 ft. level. The flow of watsr is still just as strong as ever and gives much tronhle.

Nevada.—The face of the west crosscut from the main north drift is still in qnartz, with very good hunches or ore coming in. No west wall yet.

East Justice.—Work is heing steadily prosecnted in the mine, every thing is heing put in excellent order.

Lady Bryan.—The old hoisting-works building has been moved back to make room for the new.

Mint.—Cutting out and putting in the new station at the 1100-ft. level is nearly completed.

Succor.—The foundations for the new pumping machinery, are about completed, ready for its reception.

(Continued on Page 148.)

Home Industry.—Ths story is told of an Americon iu Paris, who, hsing ahont to lsave for Nsw York, honght a half-dozen pecnliar looking psncil casss, at 95 cents sach, for presents to frisnds at home. In Rsgsnt street, London, hs saw some more at only 70 csnts each, and bought anothsr half dozen, thinking tbat Paris pencils at that prics wers a hargain. In Livsrpool hs purchased anothsr half dozen of thsse articles, at 35 csnts each. "Singnlar," hs ohserved, somewhat surprised, "bnt it sesms ths further ons gets from Paris ths cheaper articles of Parisiau mannfaotnrs become. At this rnte I should havs done hstter hy waiting until I,reached Nsw York. "You ars about right, sir," said ths shopman, who by this time had his money safs in ths till. "Yon ars abont right, sir, for them pencils is all mads in the Statss." In the mattsr of shops and their contents, Paris, London, and New York ars well-nigh ons, and it reqnires a sharp eye and ampls sxpsriencs to discovsr anything in sithsr of thsm that is not for sals in both ths others.—*Trade Journal.*

Detection of Fuchsin Adulteration in Wine.—According to M. Jacquemin, natnrnl rsd wins doee not stain wool, ths material regaining its whits color aftsr washing. If fuchsin be nssd to color the wine, however, ths wool rsmains tinged with red.

The Engineer

The 300-Mile Oil Pipe.

Ws lately mentioned tbe enterprise to carry petroleum from ths oil regione of Pennsylvania to ths seaboard through a pipe 300 miles long. We find in the Boston *Traveler* soms detaile of ths project which will hs of general intsrsst

Ths plan proposed is to run the oil tbrough a four inch pipe laid on ths surfacs; the forcing power will be 900 pounds to ths sqnare inch; thers are to bs stations at distances of 15 miles, at each of which au engins of a hnndred horse-power will hs erscted to work a pnmp to continne the flow from point to point. The company having decided npon ths oonstrnction of ths work, ths prssidsnt sought ths ssrvices of Gsnsral Harman Haupt, of Hoosac tnnnsl fams, and who, duriug the wsr, was chisf of the hnreau of militsry railroads, and a hydrographical engineer of grsat skill and experience. Hs pronounced ths schems, after a thorough sxamination, to be sntirely prscticable, and he is now acting as engineer-in-chief.

As a proof of how valuabls this traffio has been to the several railroads ovsr which ths oil has besn borns, it is only necessary to say that up to ths present time the railroad chsrges aggregate $79,000,000. The minimnm cost of trsnsporting oil hy rail is 50 cents per barrel, and ths minimnm cost hy ths pips process is 16 csnts. The averags obargs hy rail is one doller snd a qnarter.

The estimated cost of ths sntire work, including fixtures, stc.; is one and a qnarter million dollars, and considering the difference in cost hetweeu tbis method and tbat by rail, upon the hypothssis that the company will discount at least 25 csnts a harrel on rail ratss, it will readily hs seeu that with all the expeuses of operating, the first years earnings will pay ths first cost of ths work.

Ths Pennsylvania company is ths parsnt company, but thers is also ths Baltimore transportation company, chartersd by ths state of Maryland, and some fivs other companies ars expecting to nnite. The first objeotivs point or terminus will he Baltimore, as being the most feasible and direot routs for tbe pipes. Following which othsr tsrmini will hs sstablishsd, in Philadslphia, New York, etc.

The pipes bsing laid on ths snrfacs and there heing no obstacle in the way of forciug ths oil to any hight, the line will litsrnlly be an air line and ths distance from the oil rsgions to Baltimors is 300 miles. The oil will he distributed from ths pipes into immense reservoirs with refining sstsblishmsnts adjscsnt.

The fsssihility of this enterprise, eo far as the passage of the oil throngb pipes is oucerned, has bsen fnlly estsblishsd by ths present system in operation in ths oil regions, where ths aggregats lengtb of the pipes conveying the oil from ths eeveral wells to ths resrvoirs is nearly 250 miles.

The East River Bridge.

Ws have noted from tims to tims the progress of the East river hridgs, hetween Nsw York and Brooklyn. They ars now ready to strstch the cables. The plau of opsrations, as given by the sngineer, is as follows: A steel rope, three-fonrths of an inch in diameter, will bs temporarily fsstsnsd to ths Nsw York anchorags, thencs convsyed over ths top of the towsr and the coil conveysd to Brooklyn by means of a soow. Ths rope will thsn hs passed ovsr tbs Brooklyn tower and to ths anchorags, but will he left slack and nndsr water until late at night or early in ths morning, whsn fsw vesssls ais passing, wbsn it will hs pullsd tant. This stesl rops will also bs temporarily secnred to ths Brooklyn anchorage and ths ooil borns back to New York by the scow, and ths snds connected, thus forming an endless rops, working on pulleys at each anchorage and on sach towsr, and worksd hy machinery on the Brooklyn sids. By msans of this sndless rops othsr similar onee will hs put np as rsquirsd for ths farther oonstruction of the hridgs. First, two stesl wirs ropss, two nnd five-sighth inches in diamster, will hs carried across and made ssoors to temporary fastsninge at sach anchorage. Thess will he tbree and ons-half feet apart, and placed a littls to ths south of ths middls of the towsr, running ovsr ths top. They will be nssd for ths coustrnction of a temporary bridgs tor the uss of ths workmen. Oak planks, one and ons-half inches in thickness, will bs laid npon the ropss, with spacss of abont half an inch, hoth for ths pnrposs of economizing material and to lessen tbs effeot of ths wind npon it. They will hs fastened by strips running lsngthwiss across the ends, which will bs holted to tbs ropes hy U-shaped olamps.

The hridgs will bs complsted by stretching small ropss on each side ahont thrs s fest ahove the flooring and secnrsd to svsry ten fest. It will hs rsndsred firm hy guys.

Thrss other stesl ropes, of ths sems magnitude as thoss nsed in the construction of ths foot hridgs, will hs stretchsd across the river over ths tops of ths towsrs—one 27 feet south of ths foot bridge at ths edgee of the pisre, ons over the nortb edges, and ons midway bstwesn ths north rops and ths foot bridgs, with a spacs hetween ths north and south ropes of 81 feet. Tbs ohject of thsss last mentionsd ropss is to snpport small cross bridges, technically called cradles, and necssary for ths conetruction of the other portione of the bridgs.

Thsre will bs five of these cradles, ons in each land span hstween each tower and its anchorags, and three at squal distances in ths river span. Thsy will projeot 10 fest beyond ths ontside cahle, and will snpport pulleys for ths endless ropes. The whols temporary structurs will bs 200 fsst abovs high water at its oenter and lowest point, so that no water craft will he interrnpted hy it. After this work is completed, tbe construction of ths bridge propor will hs procseded witb, and ths first step will be ths etrstching of ths main cahlss, which will he put np at tbe same slevation as tbs tsmporary bridgs and lowsred. Thees cahles will be composed of 19 strands, each strand being made np of 330 wires, No. 7 gage—that is a littls more tban onseighth of an inch in diamster. Ths matsrial used will be of ths best qnality of stsel wire. The ropes of ths temporary hridge will not hs taken down, hut finally incorporated into ths superstrnctnrs of ths hridgs.

Stone for the Mississippi Jetties.

Ws have recently noted ths continned indications of success in Captain Esds' work in the mouth of ths Mississippi. We learn from an Eastern exchsnge that measnres are complsted for ths dslivery of ths stons which is to anchor in the immsnse wooden crates. The following is intsresting: Ths endless snccession and strata of willow "mattrassss" have hesn sunk into tbs sea fer ont from Port Eads, and ars ready for their armor of stone. The amount of stone necesoary seems almost beyond compntation. The terms of the contract ars such that ths stone is not deliverable nntil thsre sxists 20 feet of watsr on ths bar at South pass. The depth of water at this point has already increased, since ths mattrasses were placed in position, from eix to 17½ feet and the cnrrent is stesdily cntting deeper. The partiss are gstting out the material at limestone quarries located at Ross Clairs, Illinoie, soms 40 miles helow Padncah, Ksntncky, nnd at Golconda, Illinois, 12 milss further down. Abont 5,000 yards ars now quarried and ready to ship at short notice. The stons is of irregular form aud in pieces varying from five to 150 pounds in wsight. For ths ses snds of the jettiss, stons weighing from 2,000 to 4,000 pounds is reqnired. This stons is loaded into bargss sud towed to Port Esds, whers it is measnred by government officials snd taksn alongside ths sunksn mattrasses. Thsse, it will he recollected, ars soms 60 feet wids at the top, and extend thonsands of feet into the sea. Ths stons is dnmped into the water on either sids of the jetties, and the process continued nntil ths exterior surface of ths jetties is covered, snd preseuts ths appearsnce of "rip-rap" work. Ths top of this hsap is to bs paved with flnt stones, sst edgewiss, and ths entirs structurs is to he made as suhstantial as monsy and skill cau make it. It is to be hoped that ths remaining two and oue-half feet will soon bs scooped off ths bar, but Mssrs. Dippold & McDonald do not cars to begin dslivsring stone till aftsr ths first of Ssptembsr, when ths grsnt heat will he over and the work he safer for thoss employed. Eade is to get $500,000 when the channsl is 20 fset dsep, and a liks sum for every additional foot up to thirty feet, the maximum desired.

Tunnels.—Letest advices ooncerning progress in two great hores is as follows: Ths last brick in the Hoosac tunnel is laid. Stsel rails are ordered for the whols distance betwsen Grsenfield & Bradwell's Fsrry.

In ths St. Gothard tunnel, the monthly progress is 380 fset at the northern snd, 200 fest at ths eouthsrn. Ahont 10,000 feet ars completed at ench end; 50,000 fset rsmain. The work shonld he completed in 1883, at the present rate.

Hell Gate.—The Hell Gats blasting will taks plaos on the 15th of Ssptsmber. Fifty thousaud ponnds ot dynamits, glyosrine and rend-rock will hs used, but no grsat svidsnce of ths blast will hs ssen ahovs ths snrfaos of the watsr. Yst it is expected the work will hs done so effectively that ths channsl will bs despsnsd thirty fest, nnd ths passage of the largest stsamshi ps will bs allowed.

The First American Canal.—Ths first American canal was from Middletown, on tbs Snsquehanns, to Reading, on the Schuylkill, heing 79 miles in length, with a navigabls fesdsr of ssven miles. It was snrveysd in 1762 hy David Rittenhouss and Dr. Wm. Smitb, although said to have heen suggsstsd by Psnn in 1690; was commencsd in 1764, and completed in 1837.

The largest hridgs in ths world is ths Chsnat railroad bridgs, British India, complsted last Decsmber, aftsr four years' work. It bas 64 spans, each of 132 feet, making its sntirs length 9,300 fset. Ths masonry is all of brick, 5,000,000 cubic fest in quantity. Ths girdsre weigh 9,000 tons.

A commission of engineers is at pressnt engaged in preparing plans for an undsrgronnd railway in Paris, to connect several of ths prominent points in the city.

To harden plaster objects, it is recommsnded to add to it some thrse or fonr per cent. of powdsred althea root (marsh mallow). Ths resultant mass, in ahont an honr after setting, will he fonnd to hnvs acqnired such n degrss of hardnsss that it may bs turned, sawed, etc. Buttons, dics, dominoes, etc. are made from it.

[From the Mechanics' Fair Daily.]

Chips from Cold Chisel.

EDS. FAIR DAILY: I think "Worker" struck pretty close to the mark in his letter in your first paper for this fair. I wanted to sit down right away and tell you what I thought of the words he wrote, but my constant engagement between hammer and iron made it impossible for me to chip into anything else. I have been ground up pretty close, and while I am waiting at the forge to be drawn out and fixed up with a new straw color, I will use my blunt end to strike on the heads which "Worker" struck up in his letter.

He speaks of the advantage of showing things. Now I am an obscure sort of a tool, and I have no doubt that the aristocratic lathe and planer will say that my work ought never be seen. Never mind, the pattern maker will sometimes make too much allowance for the shrinkage, or the moulder will wrap the pattern too heavily, and I have to be called in to fix up a fit, and then I always have to lie around to smooth over every one's blunders, and consequently have some right to a showing, and I say that if a man expects to do anything he has got to make a show; I don't care whether he wants to be President or wants to sell a patent wash-stand, he has got to show some good either in himself or in the wash-stand, before he can accomplish it. Just look at the two men who are now running for President; each with something called his record to parade before the people. And they are right, too. A man without a record is like a cow-catcher without a locomotive, there is nothing to push him. So it is with a man making an show of his work. The public is a hard thing to gobble up, and there's nothing like getting it into a little disposition beforehand; for this it is a good thing to make a show. I believe a good thing well known is half sold or hired, as the case may be. Getting an introduction is the hardest part of many a courtship. There's nothing like smoothing away the roughness. I always like to have a casting vitrioled before I tackle it.

Another thing which "Worker" hints at is, that workmen should support everything which leads them to get together and think together. That is good. I like the mooning more than a little. A good pipe and a good talk do a great deal to keep us posted on the things which are going on, and enable us to understand each other. The coming together at the fair is much better, because there is so much that is suggestive, and may not only be talked about, but also worked over in a hundred ways.

But another way in which it seems to me that fairs and institutes are valuable to us all is this. They lead us to take a higher view of our calling, to be more satisfied with it and more energetic to advance in it. Since I have read that noble speech of Henry Edward's on iron, and its relation to civilization, which you printed a few days ago, I have felt like hurrahing for the shining metal which yields so readily to my stroke, and takes on so many useful forms. I tell you it does us workmen good to read something which gives us sound reason to think our business noble and useful. We know well enough that we make machines and men buy them, consequently they must be useful; but it is rather a new idea to some of us to have our work called noble, and the thing all reasoned out, so that we can see just what has been accomplished. We do not lack for flattery, especially about election times, but for a genuine and honest estimate of the relations of our work to civilization—why it really makes a fellow feel that he is doing something after all.

It does me good especially to see our old friend iron set up so high as Mr. Edwards puts it in his eloquent words. I look upon its grey crystals as they turn up under my tools with a sort of reverence now that I know better what it has done for mankind. We are tired of praise of yellow gold. It is handsome and I sometimes stand a few minutes looking through the windows of the brokers to see the shining yellow piles or to watch the clerks tossing it about. But think of the men it has tempted and ruined. Not so with iron; it is a true, glorious friend of mankind. I am tempted to strike it gently with my hammer when I think of it; but then it is only by hard knocks that iron comes to serve us, and it rather welcomes the blow which elevates it into position and usefulness.

We need to think more of these things and to discover all the noble, elevating, thoughts which can be drawn from our work. If we but heard it aright, every hammer stroke would be a note of music, and all our work would come easier to us, because we would be filled with the spirit of progress and improvement there is in it. Success, I say to every enterprize which cultivates this spirit among us. Let us look and listen, and march onward in our enjoyment of our life and in a belief in the nobility of our work. COLD CHISEL.

A GREEN varnish for metallic objects may be prepared by dissolving as much sandarach or mastic as will be taken up in strong caustic potash, then diluting the solution with water, and adding a solution of a copper salt (either sulphate or acetate). The green precipitate is then to be washed, dried and dissolved in turpentine.

Useful Information.

A Handy Table.

We are indebted to Mr. J. H. Main, says the Albany *Democrat*, carpenter and contractor, for the following valuable table to those who desire to make their own estimate for building. It is worth pasting in your scrap book:

One thousand feet of flooring or ceiling will lay 800 feet of solid superficial measure. One thousand feet of siding, 750 feet. One thousand feet rustic siding, 10 inches wide, 900 feet. All lumber is measured before planing, and is so calculated in all bills.

Five gallons of oil is sufficient for 100 pounds of lead—boiled oil or raw; also, turpentine weighs seven pounds to the gallon. Eight pounds of properly mixed paint will cover three squares, one good coat.

It takes from five to six pounds of shingle nails to the 1,000 shingles. Twenty-five pounds flooring brads will lay 1,000 feet flooring. Sixteen pounds flooring brads, three penny, will lay 1,000 feet ceiling.

Nails will weigh as follows: Seven inch spikes, five will weigh a pound; sixty penny nails, nine to the pound; forty penny, 13 to the pound; thirty penny, 23 to the pound; twenty penny, 34 to the pound; twelve penny, 48 to the pound; ten penny, 58 to the pound; eight penny, 89 to the pound; six penny, 153 to the pound; four penny, or shingle, three hundred and four to the pound.

Average green fir lumber weighs 4½ pounds to the foot; seasoned, 4 pounds; green cedar, about the same as fir; seasoned, 3 pounds. Five hundred feet of either green cedar or fir is equal to one ton. Green cedar shingles weigh about 400 pounds to the 1,000; dry, 250 to 300. Shingles baled, in what are called one-half bunches, should overrun, or, in other words, should contain 504 shingles; one quarter bunches fall short four to the bale, or 16 to the thousand.

CRYSTALLIZED WOOD AND PAPER.—According to Prof. Bottger, the simplest method of giving paper and wood surfaces a crystalline coating is as follows: Mix a very concentrated cold solution of salt with dextrine, and lay the thinnest possible coating of the finid on the surface to be covered, by means of a broad soft brush. After drying, the surface has a beautiful mother-of-pearl coating, which, in consequence of the dextrine, adheres firmly to paper and wood. The coating may be made adhesive to glass by doing it over with an alcoholic shellac solution. Prof. Bottger mentions the following salts as adapted to produce the most beautiful crystalline coatiag, sulphate of magnesia, acetate of soda, and sulphate of tin. Paper must first be sized, otherwise it will absorb the finid and prevent the formation of crystal on its surface. Visiting cards, with a mother-of-pearl coating, have for some time been in use. Colored glass is well adapted for such a coating, which has a good effect when the light shines through.

STEEL BELTING.—Dr. William Fields, of Wilmington, Del., has applied for a patent for steel belting. The Wilmington *Republican* says: "Any good, tough steel will answer the purpose. The great superiority of steel belting over that of leather is first its cheapness, not costing by one-third as much as that of leather; second, it will not stretch or get out of shape; third, it is quickly made, as there is an inexhaustible supply of the crude material in this country. Steel can be made at two and a half cents per pound, and rolled into belting for two and a half cents more. It don't require to be more than one sixteenth of an inch thick for most of the belting, consequently it will not weigh much per foot. The Doctor's process for slackening and tightening the belts in a few seconds, without disturbing the joinings, is also a great advantage over the strings and lacings now in use.

A NEW USE FOR IRON.—One of the most incomprehensible discoveries—if it be true, which is questionable—that we have ever encountered is announced in a recent French journal by M. Massie. He says that the mere introduction of iron bar in the box in which barley, rice, bran, biscuit, and like farinaceous materials are stored, is sufficient to prevent either the ravages of decay or the attacks of insects. Full details of the experimental investigation are given. An iron bar three pounds in weight is reputed to have protected 40 gallons of grain; and certain biscuits were preserved for seven months in excellent condition, while others, under like circumstances but without the iron, were totally destroyed by weevils.

POISONS.—On April 21st the Austrian government published a decree in regard to the traffic in poisons, declaring the following substances to be included under the term poison: 1. Arsenic and all its compounds. 2. Chlorides and oxides of antimony. 3. Oxides and salts, including the chlorides, iodides and bromides of mercury. 4. Ordinary phosphorus. 5. Bromine. 6. Prussic acid, and preparations containing it, as also all cyanides, with the exception of those containing iron. 7. All violently active preparations made from poisonous plants and animals, and manufactured artificially, such as the alkaloids, curare, cantharides, etc.

A GOOD bell metal consists of copper 100, tin 20 parts.

RAISING AND LOWERING TRUCKS IN SHAFTS.—The invention of Mr. George Hondaille, of Paris, relates to a apparatus whereby rods vertically reciprocating in a mine shaft are applied to raise or lower trucks stage by stage. Vertical spindles are arranged to have an intermittent and reciprocating partial rotary motion, and on these spindles are fixed arms or hooks, which by the movement of the spindles are alternately protruded, so as to catch handles projecting from the trucks, and withdrawn so as to clear of these handles. One set of the spindles having no vertical movement their hooks or arms serve as rests for the trucks, whilst the other set descend with the reciprocating rods, and these in their turn catch the truck in their ascent, and so lift it a stage. A like arrangement with different timing of the movement serves for lowering. Instead of one set of moving and one set of stationary spindles with their hooks or arms both sets may reciprocate in opposite directions.

CURE FOR BUCKEYE POISON.—An Ohio farmer wrote to ask if there is any cure for a cow which has been poisoned by eating buckeyes. He had lately lost a valuable milch cow from this cause. A member present had been told that a pint of lard melted and poured down the cow's throat will prevent all serious effects from eating this growth. Another member remembered to have seen this same remedy in print.—*N. Y. Farmers' Club Proceedings.*

The area of a safety valve should be 006. times the area of the fire grate.

Good Health.

Rattlesnakes and Their Bites.

In the course of some notes on the rattlesnake, published in *Forest and Stream*, Dr. J. W. Bailey, of Albany, asserts that this serpent is the most sluggish of the snake family. It never strikes unless in self-defense, excepting just before and after its winter sleep. Of course, the rattlesnakes idea of self-defense is rather broad. Thus, if a person step upon it by the purest accident, the snake will make no allowance, but strikes the intruder on the spot. To strike, however, it must be in close coil, with its head erect. It is capable of springing only a little more than half its length, unless it be lying on an inclined plane; then, by supporting itself entirely on its tail, it can spring much farther. Hogs attack the rattlesnake with impunity, the effect of the poison being probably neutralized by a thick layer of adipose tissue. Dr. Bailey is able to contradict, from his own experience, the statement that serpents do not move about at night; he has often when riding by moonlight seen them gliding through the grass. The author says that when the venom of a serpent has entered the circulation all remedies are unavailing. He has seen a freshly killed chicken split open and applied to the wound, with good results. In such cases the flesh of the chicken turns green and putrid when it comes in contact with the virus. The most certain remedy, however, is whisky or brandy used in large quantities—say a quart—immediately. Intoxication is not exhibited until the poison has been counteracted. Sweet-oil, taken in doses of several ounces, is also effectual. Sportsmen camping in Texas are accustomed, after pitching their tent, to stretch around it a hair lariat. The short hairs irritate the snake's belly as he attempts to cross the lariat, and he retreats.

Sleep for Mothers.

It is all very nice for men folks to write proverbs about "the morning hour having gold in its mouth," and "he that would thrive must rise by five," and

"Plow deep, while sluggards sleep,
And you will have corn both to sell and keep."

But let them be up and down all night with whooping-cough babies, and earache lads, or toothache girls, as nine women out of ten find their rest broken, and they would sing quite another tune. The theory may be beautiful, but the practice is the difficulty. Early rising is an excellent thing if you sleep well, but rank suicide if you do not. Make some provision to have the breakfast got by others, if the morning hour is the first good refreshing sleep you can get. It is this terrible sleeplessness, which so few think an evil of any great moment, that drives such scores of mothers to the insane retreats; that robs life of all cheer, and vigor, and hopefulness, and makes many a young mother look old and broken in her very prime. Some one has truly said, that the cry for sleep the world over, was far more urgent than the cry for bread. You would consider it a cruel oppression which robbed a working woman of a third of her needful food, but she could better live on one meal a day than on a third of her natural rest.—*Esther in Western Rural.*

CHANGE FOR SICKNESS.—Dr. Reginald Southey has recently been delivering a course of valuable lectures on "Individual Hygiene" in London, and in one he introduced a table of "Expectation of Sickness," which he had prepared, and which is as follows: At 20 years of age, calculate on four sick days yearly; at 20 to 30, five or six days; at 45, seven days; at 50, nine or 10 days; at 55, 12 or 13 days; at 60, 16 days; at 65, 31 days; at 70, 74 days. Of course this refers to people of average good health, and not to those who may be afflicted with any ineradicable or chronic ailment.

Eating Bread and Milk with Lime Water.

Milk and lime water, says the *Scientific American*, are now frequently prescribed by physicians in cases of dyspepsia and weakness of the stomach, and in some cases, to our knowledge, the diet has proved very beneficial. Many persons who think good bread and milk a great luxury, frequently hesitate to use it for the reason that the milk will not digest readily. Sourness of the stomach will often follow. But the experience of many will testify that lime water and milk is not only food and medicine at an early period of life, but also at a later, when, as in the case of infants, the functions of digestion and assimilation have been seriously impaired. A stomach taxed by glattony, irritated by improper food, inflamed by alcohol, enfeebled by disease or otherwise unfitted for its duties, as is shown by various symptoms attendant upon indigestion, dyspepsia, diarrhœa, dysentery and fever, will resume its work and do it energetically on an exclusive diet of bread and milk and lime water. A goblet of cow's milk to which four teaspoonfuls of lime water have been added, will agree with almost any person, will be agreeable to the stomach when other food is oppressive, and will be digested when all else fails to afford nourishment.

The way to make lime water is to procure a few lumps of unslacked lime, put the lime in a stone jar, add water until the lime is slacked and is about the consistence of thin cream. The lime will soon settle and leave a clear and pure liquid at the top, which is lime water. As the water is taken out more should be added, and the lime should be frequently stirred up and allowed to settle.

CURE FOR SMALL POX AND SCARLET FEVER.—A writer in one of the city dailies gives the following, which we print for what it may be worth: In looking over my scrap book I find the following recipe, which may prove of service to the general public at the present time. The writer says: "I herewith append a recipe which has been used to my certain knowledge in hundreds of cases. It will prevent or cure the small pox, though the pittings are filling. When Jenner discovered cow pox in England, the world of science hurled an avalanche of fame upon his head, but when the most scientific school of medicine in the world, that of Paris, published this recipe as a panacea for small pox, it passed unheeded. It is, nevertheless, as unfailing as fate, and conquers in every instance. It is perfectly harmless when taken by a well person. It will also cure scarlet fever. Here is the recipe, as I have used it, and cured my children of scarlet fever; here it is, as I have used it to cure small pox; when learned physicians said the patient must die, it cured: Sulphate of zinc, one grain; foxglove (digitalis), one grain; half a teaspoonful of sugar; mix with two tablespoonfuls of water. When thoroughly mixed add four ounces of water. Take a tablespoonful every hour. Either disease will disappear in 12 hours. For a child, smaller doses according to age. If counties would compel their physicians to use this, there would be no need of pest houses."

BURNS AND SCALDS.—The recent fearful explosion on board the British ironclad *Thunderer* has called out the publication of many recipes and remedies. Among them all, the following, contributed by an old and experienced physician, has the merit of convenience and readiness. The remedy is simply this: The common whiting of commerce (found in nearly every kitchen), reduced by cold water to the consistence of thick cream is to be spread on a light linen rag, and the whole burnt surface instantly covered, and thus excluded from the action of the air. The ease it affords is instantaneous, and it only requires to be kept moist by subsequent occasional sprinklings of cold water.

DANGEROUS VEILS.—Ladies in traveling at this season of the year frequently wear veils of gauze most commonly light green in color. It appears that the use of these is not wholly safe; as a case has lately been published of a child, in Troy, N. Y., whose face while asleep was covered with a green veil to protect it from flies. The infant managed to get the fabric in its mouth, sucked it, and died shortly afterward, with all the symptoms of poisoning.

HOISTING BY ENDLESS CHAIN.—The monthly meeting of the South Staffordshire and East Worcestershire institute of mining engineers was held on Monday, last week, at the colliery of Messrs. Wright, North and North, Rowley Regis. The *Colliery Guardian* says: The colliery consists of 90 acres of the celebrated thick coal of South Staffordshire, 65 acres of which are still in the maiden state. The most interesting part of the plant is the adoption by the firm of the endless rope and endless chain systems. The coal is brought to the pit edge in tubs along the main gate-road by the endless chain attached to a 16-horse power engine, and brought down the sides of the down cast shaft. When the coal arrives at the surface, it is conveyed to the wharf, near Oldbury, by an endless chain, 1,800 yards in length, connected with the aforesaid 16-horse power engine, and 500 tons per day can be delivered. Although not new in the district, the visitors looked on with considerable interest, whilst the heavily loaded tubs ran down the incline, and by their momentum brought up to the pit's mouth the empty ones. These unhooked themselves from the endless chain in a regular manner, and went to be refilled for a downward journey.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 mos.	12 mos.
Per line..... .25	.80	$2.00	$5.00
Half inch (1 square)...$1.00	3.00	7.50	24.00
One inch..... 1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

Our latest forms go to press on Thursday evening.

Saturday Morning, Aug. 26, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Electric Light; Pacific Saw Manufacture, 137. Combustion of Coal; A Plea for Inventors; Notices of Recent Patents; A Sad Suicide, 144. Some Mines of Humboldt County, Nev.; Perkinson's Flexible Harrow; Facts About Peat; Gems and Precious Stones, 145. The Centennial at Philadelphia, 148.

ILLUSTRATIONS.—Magneto-Electric Machine for Producing the Electric Light, 137. Perkinson's Flexible Harrow, 145.

MECHANICAL PROGRESS.—The Cornell Measuring Machines; Sheffield Coming to America; A Large Belt; Returning Steam to the Boiler; Great Belts; A Great Army Cook Shop; Parallel Rules; American Machines in Holland, 139.

SCIENTIFIC PROGRESS.—Watering with Chloride of Lime; Instinct; Experiments on American Coals; Classification of Clouds; Water in Coals; How to Burn a Diamond; Purification of Oils, 139.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 140.

MINING SUMMARY from various counties in California, Nevada, Montana and Idaho, 141-42-48.

THE ENGINEER.—The 300-Mile Oil Pipe; The East River Bridge; Stone for the Mississippi Jetties; Tunnels; Hell Gate; The First American Canal, 142.

USEFUL INFORMATION.—A Handy Table; Crystallized Wood and Paper; Steel Belting; A New Use for Iron; Poisons; Raising and Lowering Trucks in Shafts; Cure for Buckeye Poison, 143.

GOOD HEALTH.—Rattlesnakes and Their Bites; Sleep for Mothers; Chance for Sickness; Eating Bread and Milk with Lime Water; Cure for Small Pox and Scarlet Fever; Burns and Scalds; Dangerous Veils, 143.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 148 and other pages.

MISCELLANEOUS ARTICLES.—List of Exhibits at the Eleventh Industrial Exhibition of the Mechanics' Institute; Cleopatra's Needle, 138. Home Industry; Detection of Fuchsin Adulteration in Wine, 142.

NEW ADVERTISEMENTS.

Golden State Iron Works, Palmer, Knox & Co., S. F. Notice to Parties Ordering Furnaces, Geo. W. White, S. F.; Asthma and Catarrh Remedy, D. Lancell, Apple Creek, Ohio; Union Stone Co.—Assessment; Sierra Iron Co.—Assessment.

WYOMING MINES.—A correspondent sends us some items from a district which is 45 miles north of Rawlins, in Wyoming Territory, but fails to tell us the name of the district. He informs us that they are opening up some very good mines there. The Vulcan company have already spent some $30,000, and are now incurring an outlay for machinery of $20,000. The tunnel to strike the lead is 400 feet in length; depth from surface, 200 feet; width of lead, 19 feet in vein matter, or 29 feet between walls. No excitement has been made about the matter, for the reason that no assistance is needed from capitalists, although at the same time they would like to see good men come in and develop some of the mines in the district, of which there are hundreds that would pay. In the "Matilda Jane" pockets of peculiar ore are being met with, assaying gold, $38; silver, $34 per ton. Works are being erected, consisting of furnaces, battery pans, etc, the process being similar to the Washoe process.

IN reviewing the Southern manufactures, the Chattanooga, Tenn., *Times* says: The South has to-day more furnaces in blast in proportion to her number than the North has, and very few of ours are losing any money, while constant loss at the North is the rule. We believe the only mill in the United States running exclusively on railroad iron which declared a legitimate dividend for 1875, was the Roane iron company's mill in this city.

THERE is a great anxiety among leading coal and iron firms in South Staffordshire, in consequence of the hills of another great iron-making concern in the Cleveland district having been returned. The circumstances leave little hope of the failure being avoided.

Combustion of Coal.

It has been stated that with the best appliances yet discovered for converting one ton of coal into the most useful effect in what we term horse-power, the result is only ordinarily ten per cent. to twenty per cent. The utmost that has ever been claimed is from twenty-five to thirty per cent of what has been calculated as the theoretical amount. It is difficult, however, to verify these statements in a satisfactory manner. The various classes and grades of coal require different fire grates, different speeds of burning, different means of admitting the air to form proper combinations of gases, and failure in these conditions alone would allow a loss of calorific value up the chimney. The usual way in which coals have been tested is crude—the same boiler, the same grate space, the same means of admitting air with every class of coal. In reality such tests only prove which kind of coal is best adapted to a particular class of boiler, not which coal will give the most useful effect.

It is well understood that few coals burn in the same manner, but this fact is often lost sight of. To accomplish a true test of their value the heat of the escaping gases must be taken into consideration with a pyrometer, and it must be ascertained by analysis that the whole of the combustible products have been consumed. Accurate tests of the respective working effects of the coals must be made under different conditions before any fair conclusion can be arrived at. It is stated that if the number of units of evaporation of steam from water at 212° produced by the combustion of one pound of a given kind of fuel, be multiplied by 966 (the latent heat of evaporation at 212°), and again by 772 (the number taken as the mechanical equivalent of heat), the result will be the number of units of heat of evaporation, of that particular kind of fuel, expressed in foot pounds of work.

It seems impossible to raise the effective power of coal to a higher rate than that mentioned above with our present system of boilers and engines. The loss of heat and consequently of power is due to many causes which seems impracticable to remedy. In all non-condensing steam engines the expenditure of heat is accounted for as follows: in the production of actual work on the piston; in raising temperature of feed water; in discharge of steam into the air through cylinder; in loss from leakage and in radiation or conduction. As before stated the efficiency represented by actual work bears a very small proportion to the mechanical equivalent of the heat transmitted to the water in the boiler from the combustion of fuel. Although these facts are well known and a multitude of intelligent men have been making every effort to overcome them for many years, little improvement has been made and the percentage of efficiency remains about the same. Still the subject is being continually investigated, and hopes are entertained that some day boilers and engines will be devised in which the loss will not be nearly so great. Even an improvement which would raise the percentage ever so slightly would be of value as an indication of what might follow.

A Sad Suicide.

William Teal, an old and highly respected citizen of Bingham, Utah, committed suicide on the 13th inst., by swallowing poison. He was an industrious and steady miner, and lived in a cabin alone. His name is well known to readers of the MINING AND SCIENTIFIC PRESS, as he has been an occasional correspondent of ours for several years. Mr. Teal was an intelligent and close observer, and his articles to this and other journals on subjects connected with the mining interests, were always appreciated. A note found in his cabin, and addressed to the coroner, gives his reasons for desiring to die in the manner he did. It reads as follows:

"When this shall be read I will have ceased to live. I will die by my own act. I have nothing to regret in life. I have done no intentional wrong, and have done all the good I could consistently with my ability. Looking back upon life, it seems like a troubled dream that I am anxious to shake off. Bad health and declining years make life a burden to me, and as its continuance can be of no benefit to myself or society, I bid the world adieu. The fatal cup is before me, which I hail as my kind deliverer. I am ready for the burial; put me in the last resting-place as I am. There are no near relatives to mourn my loss—none, perhaps, to whom I owe any duty. I think not. Adieu, world. WILLIAM TEAL."

As he says above, he was ready for burial. The house was swept clean, everything was piled away neatly, and from the looks of things he expected visitors. He had shaved clean, dressed himself in his best clothes, with a collar and black necktie on, and when found in bed had a blanket tucked snugly around him, with his cheek resting on his fingers, as if in deep study.

ON FILE.—The crowded state of our columns this week compels us to defer publication of several articles on hand, viz.: "Comstock Papers," "Alpine County Mines," "Globe District, Arizona," "Mechanical Ore Concentration."

A Plea for Inventors.

[For the MINING AND SCIENTIFIC PRESS, by JOHN L. BOONE.]

Of all the mental efforts requiring imaginative construction none is more difficult than that which is required to develop a new mechanical movement, or originate a new plan-mode or mechanical principle. The faculty of inventing depends more upon natural endowments, or rather instinctive intelligence, than upon education and experience. Experience only figures in this connection so far as it serves to familiarize the inventor with the wants or deficiencies in any line of industry; and education assists in giving completeness to the conception; but the conception itself is a matter entirely independent of either, and is just as apt to be suggested by an illiterate and inexperienced person as by one who has spent years in studying and investigating the matter; in fact more so, because education and experience are both the result of study and long familiarity with existing devices, so that they, to a certain extent, incapacitate their possessors from looking beyond the boundary of their experience and teaching. Upon the principal that "fools rush in where angels fear to tread," the illiterate inventor will investigate methods and plans which many an experienced artisan or workman would not entertain for a moment, simply because they do not possess that imaginative construction necessary to give the new creation mental existence, and because their teaching and experience do not include the new idea. Thus many of our most important and most novel inventions have been originated and developed by persons entirely devoid of technical knowledge and experience in the field of mechanics to which their inventions belong. Accident, circumstance and necessity all contribute to the discovery of new principles. Sometimes, however, we find the skilled and educated mechanic possessed of the inventive faculty, and when this is the case he proves a "world mover." Such was Ericsson, who did more to develop the engine and strengthen the navies of the world than all other inventors combined. Such was Morse, who, with a skill and learning which was admirable in its completeness, adapted and perfected the telegraphic system; with such precision and judgment that to-day it retains the principle features that he gave it. Such were Hoe and Colt, and other inventors whose memories the civilized world hold in reverence.

All patents are not productive—neither are all farms; all men are not rich; all mines are not bonanzas; but if we were to strike a balance sheet we would find that the proportion of the profitable and unprofitable patents correspond in a like ratio with the other profitable and unprofitable enterprises which men undertake.

When we consider the vast number of patented articles in the market, many of which are covered by a number of patents, we will realize that the work of the inventor is very often profitable. There is scarcely an article of human convenience or necessity in the market to-day, that has not at sometime or other been the subject of a patent, either in whole or in part. The sale of every such article yields the inventor a profit. If we purchase a box of paper collars a portion of the price goes to the inventor; if we buy a sewing machine the chances are that we pay a royalty to as many as a dozen or 15 inventors at once. Indeed the field is so vast and the number of profitable patents so great that I would by far prefer to undertake a recapitulation of those patents which are not profitable than those that are.

The universal sentiment is that genius is its own reward, and in order to give effectiveness to the sentiment the person who possesses genius in any branch of industry, is allowed to set his own price upon the result of his labors. It is therefore but a just recognition of the services of the inventor that he be allowed to provide for his own wants from the benefits which he confers upon the public. The artist who produces a picture of unusual merit can find purchasers for it at a fabulous price. The stage actor who can draw crowded houses can demand and receive for a single performance what would be a year's salary for an ordinary workman; and the lawyer that possesses the faculty of swaying the minds of a jury by his eloquence can demand and receive whatever sum of money he desires for his services, yet the labors of the inventor yield more substantial results, and benefit mankind more than all these combined. He is the sapper and miner who prepares the way and overcomes all of our mechanical difficulties; in fact he furnishes us with the honey, while we are drones in the hive that benefit from his labors. Give credit then where credit is due. The inventor is the world's benefactor, and as such we take off our hat to him.

SINCE the inauguration of the Suez canal rain falls regularly along its line, where such a blessing was unknown before. Vegetation is quite abundant in consequence of the phenomenon.

CONNECTICUT won the championship in American skill last year, having 706 patents, or one to 761 inhabitants. Arkansas is at the foot of the class; Massachusetts next to the head.

A BLACK HILLS correspondent writes: Thousands of men are idle, and cannot find employment to make a living at.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

DIFFERENTIAL HYDRAULIC ELEVATOR.—Joseph Perkins, S. F. The object of this invention is to provide certain improvements in hydraulic elevators, and it consists in the employment of one or more main hoisting cylinders in combination with supplemental cylinders or brakes, which serve by their action and connections to modify the operations of the main piston in such a manner that a heavy load may be raised at a certain speed when all the pistons move together; but when the supplemental pistons are prevented from moving, pulley connections through their uniting cross heads and that of the main piston will so multiply the travel of the hoisting rope that the cage will be raised to its full hight by a movement of the main piston over a small portion of the length of the cylinder. By allowing the operating piston or pistons to move at a different speed from that of the supplemental pistons, the speed and power can be regulated to the load to be raised, and this may be accomplished either at starting, or at any part of the ascent of the load. The water for the supplemental cylinders may be taken from the same pipe that supplies the main cylinder, or it may come from some other source. It may also by a proper arrangement of the pipes be simply transferred from one end to the other of the cylinders, instead of being allowed to pass off. The details of this machine are too complicated to explain clearly without the aid of engravings.

ORE FURNACE.—Horatio G. Livermore, S. F. Mr. Livermore's present invention comprises improvements on the furnace previously patented by him. These improvements consist principally in the continuation of the inclined ore floors, these floors being carried alternately to the right and left down through a vertical stack, having vertical partition walls corresponding with the divisions between the channels beneath the upper inclined floor. Fire places extend through the lowest part of the stack, so that the fire will pass up between each of the partitions, and it is deflected so as to heat both the upper and lower surfaces of the ore as it passes over the floors. Passages from the waste chambers are carried up through the walls to utilize the heat and fumes, as in the former patent.

BRICK AND MORTAR HOISTING MACHINES.—Thomas Mann, Portland, Oregon. This patent covers certain improvements on a similar device previously patented by the same inventor. The present improvements relate, first, to the construction of the scaffold or frame of the machine, by which the inventor is able to obviate the necessity of cutting the scantlings or pieces of timber of which the frame or scaffold is constructed; secondly, to improvements in the construction of the carriage or cage which sustains the hod when it is being raised and lowered. The improvements noted are the result of several years' experience with the original machine, and they render the machine complete and easily adapted to any class of work.

SEED PLANTER.—William T. Easterday, Watsonville. This invention relates to a novel device for planting corn, peas, beans, or other seeds, and consists of a double alternating carrier, which takes the seed from the containing hopper and carries it to the dropping spout, being actuated from the bearing or traveling by means of a lever and connections.

The Mechanics' Institute Fair.

Interest in the Mechanics' fair continues without abatement, and although the receipts do not come up to the figures of last year, the prevalence of an epidemic is sufficient cause for that. We give on page 138 a list of the exhibits at the fair from the entry books, and will next week publish a continuation of the list, adding those articles entered since the 19th inst. The entries still continue, and a number of interesting articles have recently been placed on exhibition. We give on the first page an illustration and description of the magneto-electric machine for producing the electric light, which is on exhibition at the fair.

Those who have not done so should by all means visit the fair. They will find many things of interest to see, the details of which can nowhere else be examined so conveniently. Exhibitors are always ready to explain everything to interested visitors, and no trouble has been spared to make the Pavilion a pleasant and instructive place of resort. The social features are fully recognized by the younger portion of the community. The music is excellent, the promenades spacious and airy, the building well ventilated and the attractions many and varied. The exhibition of the Mechanics' Institute is always the best one given on this coast and deserves substantial encouragement.

Some Mines of Humboldt County, Nev.

[From our own Correspondent.]

The first mining reached after leaving Carson City was in the vicinity of Oreana, on the line of the Central Pacific, 400 miles by rail from San Francisco.

The Hurricane S. M. Co.,

Incorporated in your city, are now working three mines about five miles from the station, in the Arabia mining district.

The Vanderbilt, at the bottom of a 225-foot incline, has a vein varying from three to four feet of good smelting ore, consisting of lead, antimony, and silver.

The Belvidere, at present working, is 24 inches wide, containing ore of the same character.

The Hurricane is worked by means of tunnel, the drift extending along the ledge a distance of 240 feet, showing a vein of ore similar in all respects to that found in the other lodes, and varying in width from two to five feet.

The company are running a smelting furnace on the ores taken from their mines, and turning out from four to five tons of bullion every twenty-four hours, averaging about $150 per ton in silver. The bullion contains 60 per cent. of lead, 30 of antimony, and loss in base metal of eight or nine per cent.; the lead bringing four cents per pound at Omaha. They are putting through daily from 15 to 16 tons of ore which yields from four to five tons of bullion. When I visited the furnace, which is situated on the Humboldt river, two and a half miles from the station and three and a half from the mines, they had just turned out in a 16 days' run 70 tons of bullion, and expected to continue for 30 days more before stopping to re-line the furnace. The smelting is under the efficient management of Mr. E. P. Torrey, the original builder and owner, which is a sufficient guarrantee for the future.

There is a small custom mill connected with the furnace. Mr. H. M. Hayes is superintendent of the mines and the works, at present employing about 30 men, with expectation of soon finding room for 20 more. The future outlook for the company, so far as one could judge from present indications, is very encouraging.

The Oreana Mill, Smelting and Refining Co.

Have several mines of similar character to the above; and very large smelting works at old Oreana, on the river, about two miles from the station, where large amounts of bullion have been turned out.

The Tiger,

Is located near Limerick, seven miles northeast of Oreana, and is owned by Messrs. Hope & Bennett. It is opened by shaft 125 feet, and drift each way 75 feet, showing a 15-inch vein that works $110 in gold, by mill process, the sulphurets giving assays as high as $3,721 per ton of same. The Oro Fino, an extension, has on dump 200 tons of similar quartz assaying $80 per ton.

Ten miles above Oreana, in the neighborhood of Rye Patch station, (which derived its name from a species of wild rye that is found here,) there is what promises to be eventually a good mining district, having already one mine in successful operation, that has paid its dividends and is likely to do so again.

I allude to the claim of the

Rye Patch Mill and Mining Co.,

Three miles east of the station. It has hitherto been worked by tonnel, the greatest depth attained, about 150 feet from surface, showing a width of vein matter from 40 to 100 feet, with deposits of rich ore throughout. The ore is chiefly chloride of silver, not requiring the furnace, said to be easily reduced by mill process and working up to 85 per cent. I was informed by the superintendent that since his connection with the mine, now more than a year, no assessment had been required, and though new machinery had recently been purchased at a considerable cost, the probability is that none would be necessary, as the quantity and quality of ore in sight were such that the hoisting works could be put in place, the new shaft sunk, and all running expenses paid by means of the monthly yield from the mine. Some of the rock is very rich, but on an average goes about $70 per ton. They have a 16-stamp mill, capacity 15 tons per twenty-four hours. The tailings, a large amount now on hand, are ground and amalgamated in pans, five in number, 40 tons being reduced daily. Great hopes are entertained in this community generally, that an immense body of rich ore will be found as soon as the mine can be fully opened up by means of new shafts, and a new impulse would at once be given to the whole district, as many claims have been located, some of which give indications of developing into splendid mines. One of the most promising of these is

The Hard Cash,

Situated within 1,000 feet of the Rye Patch, the property, I believe, of Messrs. Cody & Douglass, and can be traced by the croppings nearly the whole length of the claim, 1,500 feet. It has been laid bare at several points by tunnels, showing a vein of fine milling ore from 9 to 40 feet in width, the greatest depth reached not exceeding 50 feet. Ore taken from one point in the vein without assorting, worked mill process, $43 per ton. The average assays from another point where the lode is well defined reached $60. The richest ores in this region are found in bunches. Some deposits of this kind in the Hard Cash were said to give assays as high as $900.

The Washington,

Within a short distance of the above, has an incline of 125 feet. Ten tons unassorted worked $35, some bunches giving very high assays.

The Pennsylvania

Was located as a southern extension of the Rye Patch, and a tunnel following along the hanging wall is said to lay open ore of a similar character; and the Last Chance, taken up as a northern extension, has had a drift along the ledge some 60 feet, exposing ore in a few places, claimed to reach by assay as much as $150 per ton. The North Star, at no great distance from the Rye Patch on the west, has not been prospected much, but indications were represented as good.

At Unionville, once a rather flourishing place, only one company is at work, the Manitowoo & Arizona, under charge of Mr. J. C. Fall, widely known in mining circles, and to whom I am indebted for information as well as other favors.

He expressed the belief that under ordinary circumstances the mines could be made to pay, h.towing to the heavy

Discount on Silver

The work had been partially discontinued, only sufficient being done to keep them in proper shape for future working. The two mills belonging to company are running on tailings, over 80,000 tons being at present on hands, with an assay value of $15 to $30 per ton, which will pay a profit to the company, as the mining expenses are less than on ore.

The mines had been constantly improved up to the time of cessation of work, and their future is believed to be very encouraging. The stopes on the ledge will vary from two to four feet thickness, much of low grade are but improving with depth, the greatest attained being 500 feet. The company contemplates running a tonnel to tap the lode at a depth of 1,200 feet.

The Pioneer Inakip mill and mining company have a mill and valuable mines here, but owing to litigation and an injunction have been suspended for the past six months. Some of the ore from the Henning, one of their mines, will assay from $200 to $300 per ton. There are doubtless other good mines here that are lying idle for want of capital to work them.

The Ross Mine

Has an incline down 172 feet, showing a uniform ledge all the way, pitching west at an angle of 45 deg. Work was stopped on account of having too much water to contend with. Mr. Ross informed me that he had had some of the ore worked at the Auburn mill, near Reno, that had yielded handsomely, and all that was required to make a success of the mine was either a drain tunnel of 360 feet in length, or good hoisting works. Only a few facts were gleaned in regard to the

Sheba

At Star City. The main shaft has been lowered nearly 200 feet. At the 54-foot level a drift has been run a distance of 625 feet, and at a point 200 feet from main shaft, a winze following ledge is down 45 feet. At the 160-foot level another drift has been extended from main shaft 56 feet, and to be continued 144 feet further for the purpose of connecting with the winze above mentioned. The smelting ore is said to be worth $75 per ton, to say nothing of the rich sulphurets, etc., and from all that could be learned its future is likely to be as prosperous as much of its past.

The Hygiene Copper Mine

Is located in Santa Clara canyon, eight miles south of Mill City, and opened by tunnel following along the ledge, which is about five feet in width from wall to wall. Some native copper, together with a considerable amount of black oxide of copper, is found, that will run as high as 70 per cent., and the vein is improving in both quantity and quality as the work proceeds, and is looked upon by mining men, so far as depth has been attained, as a fine prospect for a permanent mine.

The Jersey,

Situated in a district of the same name, and about 45 miles from Unionville, is at present shipping a large amount of good ore to Salt Lake for smelting, and is represented as doing well, and generally spoken of as one of the best mines in Humboldt county.

At Winnemucca a considerable amount of business is done in the way of working ores at the

Humboldt Reduction Works,

Mr. George G. Berry, President, and Mr. D. Van Lennep, Manager. The ore is first run through a rock breaker, then kiln dried; and being passed through a patent self-feeder to the stamps to be dry crushed, it is carried from the battery by elevators to the top of a large Stetefeldt furnace, where it falls into the flames. After a thorough roasting, with salt for chlorination, it is drawn from below and passed through the amalgamating pans. The flues connected with the furnace are not less than 1,000 feet in the aggregate. The works under the present management are running successfully and is a paying property.

The Badger Mine,

In which some of the prominent citizens of Winnemucca hold an interest, is about 90 miles north of this place, on Bartlett creek. It is said to have a vein of ledge matter between walls of about 20 feet, and five feet of good paying ore, a gold bearing quartz, exceedingly promising, that worke by an arastra from $40 to $75 per ton.

The Ophir,

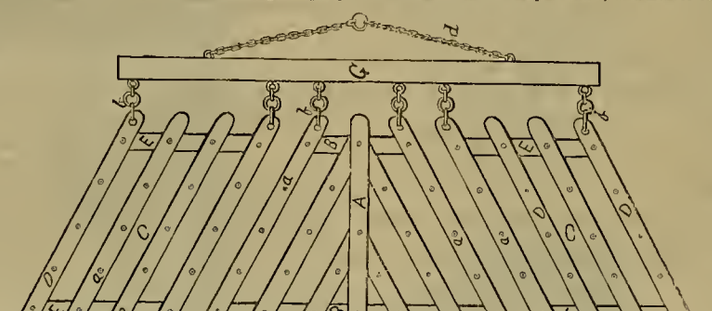
J. Robbins owner, two miles north of Winnemucca, has on surface 70 feet of vein matter and smelting ore, on which little work has been done; assays reported run as high as $1,600, and yield of silver, working process, $318, with 24 per cent. lead. A. C. K.

Facts about Peat.

[Written for the PRESS by SAMUEL PURNELL.—No. 4.]

Use for Metallurgical Purposes.

For metallurgical purposes peat often contains too much ash. If a raw peat contains 10 per cent. of ash, and affords 25 per cent. of charcoal, it is evident that the latter will contain no less than 40 per cent. of ash—a ruinous amount for many purposes. Wood charcoal contains about three per cent. of ash, and about twelve per cent. of hygroscopic water; and coke three to five per cent., and five to ten per cent. of hygroscopic water. Unless made from well condensed peat the charcoal will be friable, light, soft, and apt to fly to pieces under the blast, and so choke a furnace; neither will it bear transportation. If the cost of cutting, condensing, drying, charring and transporting peat charcoal do not render it too costly, and its ash is not in excess, the smelter need want no better fuel.



PERKINSON'S FLEXIBLE HARROW.

Peat charcoal iron furnaces require low pressure and hot blast; a lead furnace would require a cold blast doubly as heavy as for wood charcoal. For remelting foundry iron peat charcoal is excellent, also for the blacksmith's forge. In Bavaria even the ordinary air dried peat has been successfully used for iron smelting.

The charring of peat may be readily and cheaply performed by waste furnace gases. The two operations can be united—smelting iron and preparing charcoal. An objection to the use of raw peat for smelting consists in the stream of water evaporated, (free hydrogen being at the same time evolved and turning to water,) tending to oxidize the ignited iron. At an iron works in Canada blooms made with peat alone were pronounced equal to best Swedish iron. Peat is reported as having been used at Fishkill, N. Y., and at Maysville, Wis., with success in smelting iron. For the production of car wheel iron and steel rails it is claimed that peat is of special value, also for iron for bridges, and for other works subjected to great tensile strain. Official French tables show that 2,800 pounds of peat charcoal were required to produce one ton of pig iron—the same amount as with wood charcoal. For smelting refractory lead and copper ores it would seem that peat charcoal is well adapted, its ash tending to produce a fusible slag.

From the

Absence of Bituminous Coal in California,

Forests or other material from which a cheap metallorgical fuel may be obtained, it would appear wise that we seek to make useful the vast accumulations of peat throughout the State. It seems probable that iron could be produced from peat charcoal of fully as good quality as that imported, and at a less price. It might also be profitable to partially use it for making illuminating gas. The charcoal would suit for a number of industries, and for steam and domestic uses, if peat can be furnished for two-thirds the price of the coast coals it would doubtless be extensively consumed.

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

L. Chrysolite, Olivine, Periol.

Chrysolite, of which olivine and peridot are varieties, is a silicate of magnesia and iron, sometimes containing small quantities of manganese, lime and nickel. The iron varies much in the different varieties; in 27 analyses published the extremes are 6 and 29.71.

The precious chrysolite, which is the only variety used as a gem, is of a pale, yellowish green color, transparent. It is brought to Constantinople for sale, but the exact locality is unknown. According to Dana, well formed crystals of chrysolite an inch across are very uncommon.

The following analysis of a sample of chrysolite by Stromeyer may be taken as a type, although the composition varies in different specimens: Silicia, 39.73; magnesia, 50.13; protoxide of iron, 9.19; alumina, .22; protoxide of manganese, .09; oxide of nickel, .32; total, 99.68.

This mineral is called peridot when it is of a deep olive green color. When of a yellowish green and massive it is called olivine.

Peridot generally occurs in rolled masses, in which form it finds its way to San Francisco from Arizona.

It is found also in Ceylon and Brazil. Both olivine and chrysolite occur in Egypt, Mexico, Auvergne, the Tyrol and in Scotland. Olivine is found in the lava of Vesuvius, and is common and abundant in the lava of Mauna Loa, the volcano of Hawaii, Sandwich islands.

The crystalline form of chrysolite is orthorhombic.

B. B. whitens, but does not fuse; with the fluxes gives the reaction for iron. Hyalosiderite, a variety of chrysolite, fuses with difficulty to a black magnetic globule. Decomposed by boiling muriatic or sulphuric acid, the silica forming a gelatinous residue. Chrysolite has the singular property of changing its specific gravity after ignition. Specific gravity before heating, equals 3.389; after, equals 3.378. Hardness, 6—7. Lustre, vitreous; streak, usually uncolored. Transperent, translucent. Fracture, conchoidal; double refraction, positive.

Olivine sometimes occurs in meteoric stones.

The name chrysolite signifies "golden stone."

Neither the chrysolite or peridot rank high as gems, nor do they command a high price. When chrysolite is cut, it is usual to heighten its color by placing a piece of gold foil under it.

Chrysolite is a favorite with a few connoisseurs in Europe, who enjoy its peculiar shade of color. Occasionally a fine specimen commands $15 per carat.

Perkinson's Flexible Harrow.

The attention of the farmers of this coast is invited to the illustration of a new flexible harrow, invented by J. E. Perkinson, of Santa Rosa. Merits are claimed for this harrow over all others in use. It bids fair to give good satisfaction in its work, and should be thoroughly tested by farmers. It has the build of durability. The inventor informs us that it can be made for $35 on this coast.

This harrow is made in three sections, which are connected to a draft bar by links and clevises. The bars are about four feet six inches long, and there are four bars in each of the two outside sections. The center section is filled up as seen in the engraving. The harrow is made of good Eastern oak, with 63 steel teeth, and covers about 13 feet width of swath. The inventor assigns the following reasons for the superiority of his tool: First, by the lightness of the draft, two horses, of ten hundred each, can draw it on loamy soil with ease. Second, it is the best attachment in use. The draft her is perfect. By using an equalizing chain to draw by, it keeps the harrow in its right position and makes it easy to turn at a corner, as no wide spread harrow can be turned with ease without those equalizers. Third, where other patentees have failed in setting the teeth so that each and every tooth will make a separate and distinct mark, this harrow will do it on trial. The harrow is manufactured by the inventor, J. E. Perkinson, at Santa Rosa, Cal., to whom applications for rights can be made.

FIRES.—The mill of the St. Patrick mining company, destroyed by fire on the 21st instant, was insured for $10,000. The works of the Rocky Bar mining company, Virginia, Nevada, were fired on the night of the 23d inst., by an incendiary. The three compartment shaft also caught on fire.

A WASHINGTON special says: Senator Mitchell has succeeded in getting all the Agricultural college lands in Oregon approved by the Secretary of the Interior, except 80 acres, as to which there is a conflict.

THE Emperor of Morocco has declared his inability to send his customary subsidy to the Sultan of Turkey, owing to the heavy strain on his resources, caused by the suppression of the disturbances in his own dominions.

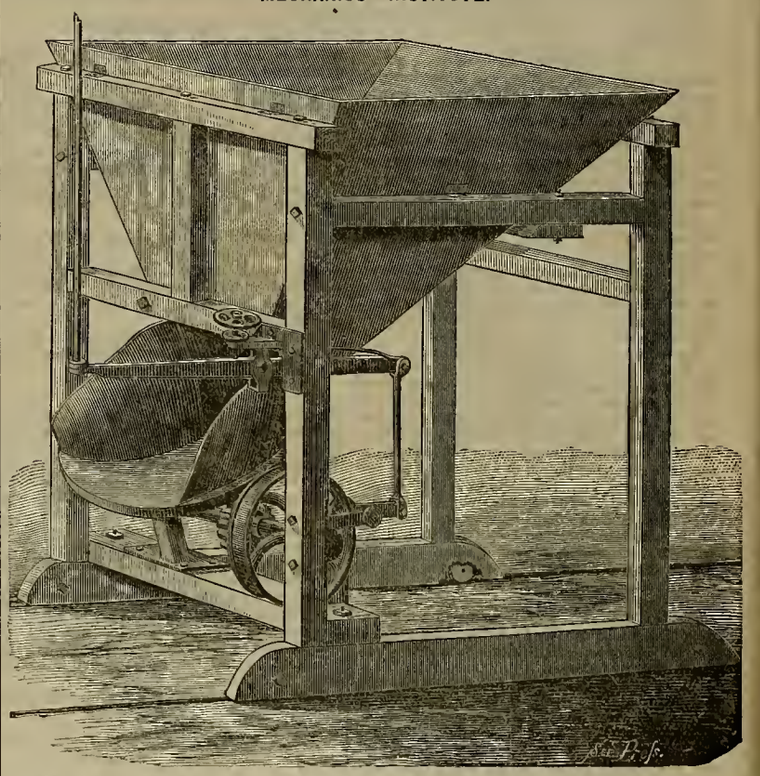
HENDY & COCHRANE'S ORE FEEDER
FOR QUARTZ MILLS,
AWARDED FIRST PREMIUM AT THE TENTH INDUSTRIAL FAIR OF THE MECHANICS' INSTITUTE.



It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply *dropped*. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says, of the Table Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them."——A letter from Mr. C. O. Belding, of Amador County, speaks in the highest terms of them.——Two of the machines were shipped to the Bunker Hill Mill, Amador County.——Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen.——Mr. Lachman, of the Soulsby Mill, Tuolumne County, says they work splendid; could not do better.——Two of the machines were shipped to the California Company, Nevada City.——O. J. Garland, of Mosquito Gulch, Calaveras County, says: "I find them an excellent machine."——S. D. B. Stewart, Supt. Lincoln Gold Mining Company, says they are a perfect success.——O. C. Hewitt, Supt. Keystone Mining Company, says: "I can safely recommend them to all millmen."

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other machine of its class.

Montana.

A RICH STRIKE.—Butte *Miner*, Aug 5: In sinking upon the last shaft of the Lats Acquisition spur lode, a rich streak of ors has been met with, at the water level, which assays $1,361 per ton, taken from pieces of unselected rock. This is a most excellent result, and is better than any ore yet taken from this mine, and at once proves the fallacy of skeptics who have asserted that at the water level the ores of this camp would grow too lean, or fail entirely.

THERE is at present a greater activity among the copper miners than ever before known in this camp, and large quantities of very rich ore are daily being brought to the surface. The steady demand for this article for shipping purposes makes a ready market for all that can be taken out.

A SILVER brick, valued at $800, was yesterday shipped from the Centennial mill. These shipments are continually being made from this mill, Mr. Howe sending them off as fast as they are manufactured.

A RICH discovery was made at Black Tail, about 12 miles from Butte, recently, of gold-bearing quartz. A small specimen shown us looked as if it contained from two to three dollars of that precious metal.

MR. OLIN having received from Salt Lake the screens necessary for the successful running of his works, has at last started up in good earnest to concentrate the large amount of copper ore which at present is lying upon the dumps at the various mines.

FIFTEEN stamps are now running continuously for the first time since the erection of the mills at Butte, and from this date the shipments of bullion will be heavily increased. At least 15 tons of quartz will be crushed daily, and as both mills are running upon ore which samples from $100 to $200 per ton, the amount of bullion produced will be up among the thousands by the end of the month.

The Averill Paint.

A walk through the works of the Averill Paint Company, corner of Fourth and Townsend streets, is highly instructive and entertaining, and we would advise persons interested visiting the city to spend a part of a day in that way. But it is not of the works that we intend to speak in this article. It is of the paint itself that we propose to discourse. A wrong impression has gone abroad regarding this valuable invention that should be corrected It is not so much the fault of the people as it is of those who first gave the paint its commercial name. From the fact that it was called chemical paint arose the mistaken idea that it was not really a paint after all, but a substitute for the paints then in use. That is not the fact. It is a paint, and manufactured of nearly the same material as the paint commonly in use, with the addition of certain chemical compounds to improve those qualities most desirable in the lead and oil paints of every day use.

The object of the inventor was to manufacture a paint that would continue to be a paint for all time to come, from the time of first mixing until its complete destruction by the elements. Common lead and oil paint separates into its constituent parts if allowed to stand a few minutes after mixing. If put upon a building the oil often penetrates and leaves the lead to be rubbed off like chalk, or beaten off by the weather.

Not so with the Averill paint. Being composed of lead, zinc and oil, all of the purest, it would be the best of paint with no additional constituents. But the addition of water glass—soluble glass—causes a chemical combination of the lead and oil so that they will not separate under any circumstances either in the can or on a wall. It is thoroughly ground together in manufacturing, is not effected by rain either when fresh or dry, and has more gloss than ordinary lead paints.

The Pavilion was painted with two coats of it eighteen months ago, after having stood one year without paint.

The Capitol building, corner of Kearny and Pine streets, and the building northeast corner of Sutter and Montgomery streets, were painted with it six years ago. The latter has since been washed, which would destroy other paint entirely. All these buildings attest its merits.

It is more economical, as it takes less of it to do the same work. We have used it, and want no better paint than the Averill.

AMERICAN INVENTIONS ABROAD.—Among the great American inventions which have been adopted all over the world, are the following: 1. The cotton gin, without which the machine spinner and the power loom would be helpless. 2. The planing machine. 3. The grass mower and grain reaper. 4. The rotary printing press. 5. Navigation by steam. 6. The hot air (caloric) engine. 7. The sewing machine. 8. The india rubber industry. 9. The machine manufacture of horse shoes. 10. The sand blast (for carving). 11. The gange lathe. 12. The grain elevator. 13. The artificial manufacture of ice on a large scale. 14. The electro-magnet, and its practical application, by Henry and Morse.

THERE is much interest and speculation in Philadelphia concerning the probable results of the dissolution of the coal combination. The decline in prices in coal seems considerable, as half a million tons will be thrown on the market.

DISPATCHES from New York indicate that the coal combination has been broken up. As a consequence there is a marked depression in the stocks of the anthracite railroads.

A NEW command has been established under General Crook, to be known as the District of the Black Hills.

The Centennial at Philadelphia.—No. 12.

Again taking a stand near the center of agricultural hall, and facing west instead of east, as we did to view the machinery exhibit, we have before us samples of all the various products of the earth and see, collected from each of the four quarters of the globe. Upon our immediate left is Spain, with her vines and fruits; just beyond is Russia, and still further to the left we have grouped together some 20 other nationalities, each with its peculiar products neatly displayed and convenient for inspection, study and comparison. Upon our right are similar products from the various portions of our own country, generally arranged by States. If we pass eastwardly a short distance along the main aisle and then turn short to the north, we come upon

The California Display,

In charge of Mr. Scupham and under the auspices of the Central Pacific Railroad Co. We have already noticed this exhibit at considerable length, but now return to it again to call attention to a few additions which have recently been made, one of the most noticeable and attractive of which is a mammoth representation of the California State seal, some three feet in diameter, and most elegantly engraved on wood by D. W. Standford, of Oakland. It is shown to good advantage and attracts much attention. Near by has been erected a pyramidal trophy of California cones, from Mr. Begg's collection. There is also a fine display of this year's crops—much that was sent, however, was destroyed by being packed too green or damp. Wheat is shown in the stalk and grain, the former six and a half feet high. Rye is shown seven and a half feet high, and corn from 18 to 22. Stalks of mustard are shown 13 feet high. There is a fine exhibit of silk in this collection, also of jute, and 56 different kinds of California ornamental woods. Messrs. Aitken, Luce & Co., of Sacramento, exhibit a beautiful monument of California marble, surmounted by a white dove. There is also a fine exhibition of silk in this collection. I am informed that the first car load of fruit intended for the Centennial was received some time since, but was not placed on exhibition on account of the imperfect condition in which it arrived. Mr. J. Earl, of the California emigrant bureau, is expecting to receive fruit regularly during the remainder of the season, which will be placed in the pomological annex for exhibition. The Pacific coast railroad exhibit may now be considered full, and is much larger than was originally intended. It should be mentioned in this connection, that California's large grapevine, after laying around for some weeks waiting for the assignment of a suitable place for its exhibit, has at length been set up near the center of the agricultural hall, where it is attracting much attention as a specimen wonder from the Golden State. In addition to the silk exhibit in agricultural hall, Mr. Neuman also makes a very fine exhibit in the silk department of the main building, and another, in which the worms are shown in all their various stages of growth, in a large case placed in the center of the California building.

The Wine Exhibit.

There are several exhibitors of California wines; but the one that attracts chief notice is that of Mr. Mahe, of San Mateo, who cultivates the Mission grape only, and manufactures from it what he styles, "Mahe's California golden wine." This exhibit is in charge of Mr. L. Ponton DeArce, who also has a restaurant near by, where, for one dollar, he dispenses a liberal lunch, accompanied with a half bottle of golden wine. This being the only wine in the building of which visitors can get a taste, and a good wine, too, it is freely praised, and, so it is said, large orders are being left for it, especially from New York. Much interest is felt, however, in regard to the opinion which the judges may pronounce on our California and other native wines, and much disappointment expressed that Gen. Nagles, the judge selected from California, cannot be present to ensure for the wines from the Pacific coast a fair and full consideration. An Eastern cotemporary says, that the large show of wines from California, Ohio and Central New York is well calculated to make foreigners think that the problem, "Will the future American drink wine?" is fairly settled in the affirmative. But be that as it may, it is certain that the extent of the industry as indicated by statistics within the reach of all, yet but little studied, supplemented by the exhibit here, must greatly surprise nine-tenths of our own people, and all foreigners. It will also arrest the attention of our temperance friends, and will, no doubt, soon cause a more earnest discussion than ever, of the relative effects on a community of the presence of high priced, strong liquors, and low grade, cheap wines. It is one of the curiosities of commercial transactions, and one of those things the reason of which is past finding out, how a foreign article bearing the imprint of importation will command a higher price and meet with a readier sale in our markets than one of equal or even superior merit made at home. Such is, however, often the case, but in no instance, perhaps, more notable than in the article of wine.

General Divisions.

In order to properly study the agricultural exhibit the visitor must first acquaint himself with the manner in which the exhibits are divided. The whole building, including the annexes is divided into ten groups, and these are again sub-divided for the conveniences of the judges, into about 100 classes. For the ordinary student the group division is all that is needed, and these are set off as follows:

1st. "Forest products," including lumber, shingles, timber, dye woods, resin, mosses, nuts, etc. This group is both interesting and instructive, forms a profitable subject for study, and largely exemplifies the beauty of nature's contributions for the happiness and welfare of man, in directions sometimes entirely unheed by human effort.

2d. "Pomology," taking in the whole range of fruit culture. This display is chiefly confined to the pomological annex, a building which until within a week or so has been conspicuous only for its emptiness. The various fruits are now coming in and will continue to the end of the exhibition, each variety being brought prominently forward in its appropriate season.

3d. "Agriculturel products." Under this head we have the grains, grasses, field and garden vegetables, tobacco, tea, coffee, seeds, etc. Next to the machinery department, this probably attracts the largest share of attention.

4th. "Land animals."—Horses, cattle, sheep, swine, poultry, etc. For want of proper accommodations within the exhibition inclosure these animals are quartered at some considerable distance from the grounds—a distance which the extreme warm weather admits of being overcome by but very few, even of those who under ordinary circumstances would have taken much pleasure in including this group within the line of their observation and study. The papers say they are some three squares away; but as the only public conveyance thither is by steam cars, and you reach them only at the second station, the squares may be set down as of unusual extent for a city plot.

5th. "Marine animals and fish culture." This group heretofore considered quite outside of agriculture may at the present well be included therein. The great national importance of "fish culture" is now fully acknowledged, and the efforts of Prof. Mather in preparing so full an exhibit of the finny tribes in their natural element is deserving of much commendation. We shall allude more fully to this interesting exhibit in its proper connection.

6th. "Animal and vegeteble products used as food or as materiels." This forms quite an extensive and interesting group, including flour, sugar, hides, leather, oil, honey, perfumes, wines, liquors, etc.

7th. "Textile substances of vegetable and animal origin," including cotton, wool, flax, silk, etc.

8th. "Agricultural machines and implements." Of these I have already spoken of at some length; but it would require a large volume to do anything like full justice to the subject. Such a volume we presume will appear in due time, under the auspices of the Centennial Commission.

9th. "Agricultural engineering," embracing machinery for draining, grading, extracting stumps, building roads, transportation apparatus, models of farm houses, barns, windmills, etc.,—a wide range of most important material.

10th. "Tillage and general management"—a subject of illimitable extent and of the highest importance to successful farming.

Of course, to study any one department, or institute comparison between similar exhibits from different States or countries, it is necessary to move about the building from one country or from one State and one exhibit to another. In the foreign exhibits each country brings into its own little territory of demarkation all which it has to contribute to each of the 10 groups. In the United States exhibits the machinery from all the States is collected and arranged in groups, so far as is consistent with allowing the different manufacturers to bring together, as nearly as possible, all the different specialties of their manufacture. In addition to, and seperate from the machinery, each State has grouped together into as compact form as possible the chief productions for which it is noted. In most instances the exhibits are arranged with a special regard to taste and attractiveness, as a merchant carefully arranges his show windows. The skill displayed in this line is, of itself, well worth a day's study. The best exhibits are not unfrequently greatly underrated by reason of the unattractive or slovenly manner in which they are placed on exhibition. Very little complaint of that character can be found in regard to any department or any building on the Centennial grounds.

Foreign Exhibits.

We have already alluded to the paucity of foreign machinery, and agricultural machinery in particular, on exhibition. England has made her chief effort in machinery hall, the main building and the art gallery. She has given up agricultural hall mainly to her Canadian dominion, which, as already stated, has done itself much credit in every direction. In the English exhibit of cereals, that upon which Englishmen evidently most prided themselves, is a lot of wheat recently produced by a retired English sea captain, and which he has characteristically styled "Mainstay wheat." The exhibitor is taking orders for it at the rate of $2.50 per bushel, for seed, and he informed me that he was selling large quantities at that rate. I begged a small handful which I took round to the Oregon and California exhibits for comparison. It was decidedly inferior, especially to the latter in every respect, as will be apparent to the most casual observer who compares the two. I asked the exhibitor to go with me and make the comparison, but he declined. Perhaps he had been there before. I did not report the result to him; concluded he would find it out himself in a less offensive manner. It is to be hoped that seekers after improved seed wheat, who may be tempted to invest in "Mainstay," will take the trouble to examine the exhibits from the Pacific coast "before purchasing elsewhere."

France.

We must give France the credit of making the most extensive exhibit in agricultural products of any foreign people save the Dominion of Canada. The display of machinery is light, but is superior to that of any other European nation. The display in this section is decidedly "Frenchy." The taste evinced in putting up the great variety of delicate preparations in glass can be equaled by no other people. Case after case is filled with long rows of glass bottles, showing fruits, cooked vegetables, sweet meats made of fruits boiled in syrups, etc. The French act upon the correct theory that the pleasures of sight greatly enhance those of taste. Hence their first endeavor is to please the eye, well knowing that that organ will be sure to telegraph its sensations to both the brain and palate, and prepare the first to direct and the latter to be in perfect readiness to receive the delicacies in store for the gratification of the appetite. Hence the great care with which they prepare their food. Among the food products in this exhibit, tastily displayed, may also be mentioned sardines, macaroni, oil, mustard, etc., also a large collection of chufa, to one bottle of which is appended an interesting account of this rare vegetable delicacy, so much prized by the French gourmand. Conspicuous here may also be seen the display of wines—those from Bordeaux, Burgundy and the champagne districts being largely in the ascendent. Of the latter, there are no less than twenty exhibitors.

Spain.

Perhaps next in interest to the French exhibit is that of Spain. The Spaniards, although not as tasty, are quite as showy as the French. Their space is enclosed with a handsome stained wood structure, with a very ornamental gothic entrance. The walls upon each side are pierced with windows, or what appear to be such, in which are displayed preserved fruits, cereals, etc. The interior is a perfect museum of wines, oil, textiles, ornamental woods, tobacco, in its various forms, gums, etc. Huge logs of mahogany and rosewood, end other bulky products rest upon the floor; while festoons of the broad leaves of its favorite weed, and sheaves of golden grain surround the pillers that support the long array of shelves upon shelves covered with orderly rows of bottles, jars, etc., that rise high toward the pointed roof arches above. Her colonies in the West Indies and Phillipine islands are also there, with their tropical productions of spices, nuts, etc. Tobacco, of course, forms a conspicuous feature in her exhibit, and cigars are shown in almost endless variety and in elegant cases, with prices ranging from $90 to $300 per thousand. The show of wines is scarcely inferior to that of France, and among them are many quits unknown outside of this Iberien Peninsula. Judging from the variety, usefulness and quality of most of her exhibits the visitor is naturally inclined to exclaim: "What a marvellously rich country,"—and so it would be, were it not for the unsettled character of the people and their government. May the peace which they have just attained give this long troubled people a season of rest and material progress which will mark an era in their history, and may the youthful sovereign who has so recently ascended the Spanish throne, be crowned with a long life and a reign as glorious in the arts of peace as was that of his most renowned ancestor in those of war.

Germany.

United, Prussianized Germany, has evidently been too much engrossed in the politicel affairs of her neighbors to do herself justice at this great American international exhibition. There is no proper display here of her rich and really useful agricultural products. She makes a strong feature of her wine and beer exhibit, and her hops. The arrangement of kegs and bottles against tall, heavy wooden structures look like sections of castle walls and is strongly suggestive of their military art and taste; but this display only gives one a false impression of what German culture and German sentiment is. Pocket handkerchiefs decorated with pictures of her military heroes, do not fairly represent her inventive genius and skillful manufactures. Her monster gun in machinery hall simply makes more prominent the poverty of her really useful exhibits, and is a painful reminder of the debasing and destructive influences of a great national love for military glory, such as now overshadows that naturally great and noble people. No country can be great in both war and peace.

Holland.

Not far off little Holland, of the low lands, the diminutive neighbor of powerful Germany, may be seen in all her quaintness and neatness, with everything in its place and as orderly as a Dutch housewife's kitchen. She was early in position, and her promptness was strongly in contrast with the tardiness of her neighbors. The "Dutch Agricultural Society," and the societies of the States of Guelderland and Zeeland make a most creditable collective exhibit of fruits and vegetables in glass jars, all put up with characteristic neatness and care.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING AUGUST 15TH, 1876.

WAGON COVERS.—Charles Cremer, Red Bluff, Cal.

FURNACES FOR ROASTING ORES.—Horatio O. Livermore, S. F.

BRICK AND MORTAR ELEVATORS.—Thomas Mann, Portland, Oregon.

EXPANSIBLE GATES FOR SEWERS.—Thomas Brady and Denuis R. Manning, S. F.

GRAIN SEPARATORS.—Thomas Jory and John W. Jory, Salem, Oregon.

HARNESS BUCKLES—William Fletcher Whitney, Ukiah, Cal.

DESIGNS.

CENTER PIECE.—Samuel Kollet, S. F.

——"The patents are unt ready for delivery by the Patent Office nntil some 14 days after the date of issne.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

General News Items.

SMALL-POX seems to he on the decrease.

EMPLOYEES of the New York and New Jersey railroad have struck.

THE import duties at this port last week aggregated $255,000.

THE weather at New York is decidedly cooler. From various points come reports of frost.

A REGISTRY clerk in the San Francisco postoffice has been arrested for robbing the mails.

Two murders by "Molly Maguires" occurred in the Pennsylvania mining regions this week.

THE preliminary works of the international exhibition, to be held in 1878 in Paris, have begun.

EDWARD S. STOKES, the murderer of Jim Fisk, will be released from the Auburn prison on October 23d.

THE iron works at Oswego, Oregon, will close down in about six weeks, and it is rumored that a company from Ohio are negotiating for their purchase.

FIRES occurred this week at Los Angeles San Benito, Livermore, Tres Pinos, Grangeville; also one near Lathrop, in which a boy was burned to death.

THE little dory *Centennial*, which started across the Atlantic from Gloucester, Mass., has arrived safely in Liverpool. There was only one man on board during the trip.

DISRAELI has issued a farewell address to his constituents, the electors of Buckinghamshire, by whom he has been returned to the House of Commons continuously since 1847.

EUGENE N. ROLLINSON, formerly senior partner of one of the principal brokers of Daniel Drew, has submitted a partial transcript to the Register in Bankruptcy. The entries in the books show that the gross amount of transactions between Drew and the firm were $75,000,000, which extended over a period of five years.

ONE MAJORITY.—The governor of Massachusette has been twice elected by a majority of one. A single vote sent Oliver Cromwell to the "Long Parliament," Charlee Stuart to the scaffold, revolntionized England and made Great Britain free. One vote gave us the tariff of 1842, and one vote made the tariff of 1846. One vote gave us Texas and war with Mexico, purchased California, turned thither the tide of emigration and will change the destiny of the world. One vote elected the Hon. David Belden county judge of Nevada county, years ago, and that one vote was our own, the first we ever cast. It placed on the judicial bench one who is now conceded to be an erudite and conscientious judge, who was thus hut an obscure and no considered talented lawyer. These facts should be a convincing proof to all that the influence of one man, he he high or lowly in station, has its effect on the destinies of the world, and every act should he well weighsed, every opinion carefully formed before its utterance.

An Asthma Remedy.

[From the Cincinnati Times.]

A CURE FOR ASTHMA.—I see that some one, in your valuable paper, asks for a cure for asthma. I have been afflicted with that dreadful disease for 44 years, and never found relief until last summer. In looking over the *Journal and Messenger*, one of your city papers, I saw a notice of "D. Langell's Asthma Cure." I sent and received by return mail, and it gave me relief in five minutes. My case was one of the worst. I can now lie down to sleep. God bless D. Langell for his remedy. His address is D. Langell, Apple Creek, Wayne Co., O. A SUBS. RIBER.

Rising Sun, Ind.

A BOX OF GLENN'S SULPHUR SOAP, which contains three cakes and costs only 60 cents, is sufficient to supply material for at least 20 sulphur baths, which would eradicate a whole catalogue of rheumatic and cutaneous maladies. Sold everywhere.

Machinery and Castings of all kinds.

The Mining and Scientific Press,

Established 1860, is a Large, Ably Edited and Liberally Illustrated Weekly—the BEST PRACTICAL MINING AND MECHANICAL JOURNAL in America. $4 per annum, postage paid. DEWEY & Co., San Francisco.

Machinery.

The Ingersoll Rock-Drill

Is Extensivoly Used in the East and

TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can he run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and HAS AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particnlar information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

426 California Street

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not mors profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Oost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased hy 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Psavins District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

DEETKEN'S

ROASTING FURNACE,

For Gold, Silver and Copper Ores.

The roasting capacity of the Furnace, per 24 hours, is from 6 to 60 tons, according to percentage and nature of the sulphureted ore, with an expenditure of one and a half to two cords of wood, and two to three shifts of unskilled labor, according to amount of ore handled. The Furnace is adapted for chloridizing, as well as oxidizing, roasting, and for the manufacture of sulphuric acid. In point of cheapness of construction and efficiency in working, the Furnace is far the best in use. Millmen in need of a cheap and efficient Roasting Apparatus will apply to

G. F. DEETKEN,

Consulting Metallurgist, Grass Valley, Cal,

Furnace can he seen on application for permit, at Grass Valley.

LATEST IMPROVEMENT.

Excelsior Scroll Saw.

Double Treadle, including one dozen Saws, 30 intimitable Fret Saw ing Patterns and Prepared Wood to the value of $4. A new device for tightening Saw, Power Drilling attachment, Wrench, Oil Cup and Driver. Speed, 800 strokes per minute. Saws 1½ in. thick. Price, complete, cased and delivered on board cars or at Express office, $12.

SMALL STEAM ENGINES,

With copper Boiler, to drive light Lathes, Scroll Saws, etc. 100 Scroll Work Designs, free on receipt of Stamp.

Saw only, without attachments, $9.

GEO. PARR, Buffalo, N. Y.

For Mines.

Largs Assortment of

MORSE TWIST DRILLS.

HASKINS' PORTABLE HOISTING ENGINES, constructed especially for economical use in mining districts, with Compressed Air or Steam, adapted to all classes of underground work and made throughout on the interchangeable plan, so that all parts can be duplicated when desired. Catalogues and Estimates given on application.

THE BUCKMINSTER ROCK DRILL.

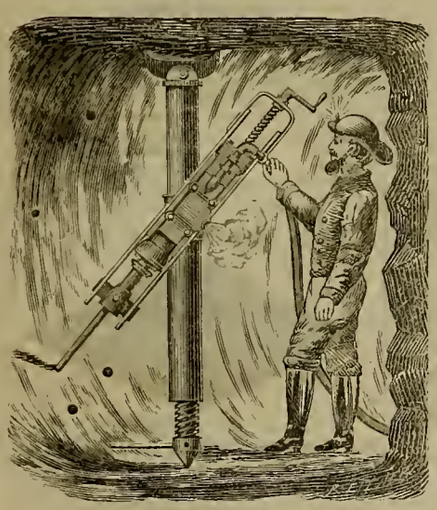
The Most Efficient Rock Drill in the Market.

LIGHT, STRONG and DURABLE.

No External Machinery Liable to Injury from Rough Usage, as all the Working Parts are Enclosed in the Cylinder and Valve Chest.

A TRUE SMOOTH HOLE EVERY TIME. THE MOST ECONOMICAL DRILL YET MADE.

THE WORKING PARTS OF THE DRILL ARE FEW AND SIMPLE IN ARRANGEMENT, SO THERE IS NO LIABILITY OF INJURY. THE CLAMPS FOR HOLDING THE DRILL ON THE TRIPOD, FOR HOLDING THE DRILL TOOL IN POSITION, AND FOR FIXING THE WEIGHTS ON THE LEGS OF TRIPOD ARE ALL IMPROVED AND VERY E FECTIVE.



The device for rotating this Drill has few parts, and can not get out of order. There is no chance for wear. The motion is positive, and never fails of action. The Drill Carriage can be turned clear round the column, and can also turn in a complete circle on the head of the clamp.

All parts subject to wear are of the Best Cast Steel, and all made to gauge and interchangeable.

This is the Lightest and Strongest Rock Drill yet invented. Being nearly all Cast Steel, it is easily handled and moved, as all superfluous metal is dispensed with.

We also call the attention of those interested to the Horizontal Air Compressor furnished with the Buckminster Drill when desired. It is Economical, Light, Easily Run and conveniently portable.

We claim that the Buckminster Drill will do as good work as any in the market, at a much less expenditure of power, and a great decrease in first cost of machinery. Drills made all the usual sizes.

Mining Companiss Dssiring Rock Drilling Machinery should Examine this Drill and Air Compressor, and ws srs confident that it will give satisfaction. Address,

American & Foreign Patent Agents.

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditionsly; Patent reissnes taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken np and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate hranch of Patent Agency Business promptly and thoroughly condncted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable ns to ahnndantly satisfy our patrons; and our success and bnsiness are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valnable inventions to the notice of the pnblic through the columns of our widely circulated, first-class journals—thereby facilitating their introdnction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign conntries which grant Patents, including Great Britain, France, Belgium, Prnssia, Anstria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columhia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portngal, Cuha, Roman States, Wurtemherg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chili, Argentine Repnblic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainahle.

No models are required in European conntries, but the drawings and specifications shonld he prepared with thoronghness, by able persons who are familiar with the requirements and ohanges of foreign patent laws—agents who are reliable and permanently established.

Our sohedule prices for obtaining foreign patents, in all cases, will always he as low, and in some iostances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six montbs (according to the location of the country SOONER than any other agents.

The principal portion of the patent hnsiness of this coast has been done, and is still heing done, through our agency. We are familiar with, and have foll records, of all former oases, and can more directly judge of the and patentahility of inventions discovered here than any other agents.

Sitnated so remote from the seat of goverment, delsys are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valnable patents may be lost by extra time oonsumed in trans mitting specifioations from Eastern agenoies back to this ooast for the signatnre of the inventor.

Confidential.

We take great pains to preserve secreoy in all confidential matters, and applicants for patents can rest assnred that their communicatioos and business trsnsactions will he held strictly confidential by us. Circnlars free.

Home Counsel.

Onr long experience in ohtaining patents for Inventors on this Coast has familiarized ns with the character of most of the inventions already patented; hence we are frequently able to save onr patrons the cost of a fruitless application hy pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their ohtaining a patent.

We invite the acqnaintance of all parties connected with inveotions and patent right business, helieving that the mntual conference of legiimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advise of importance to them from a short call at onr office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money hut their inventions also, from this canse and conseqnent delay. We hold ourselves responsible for all fees entrusted to onr agency

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valnable discoveries into practical and profitahle nse.

PALMER, KNOX & CO.,

Nos. 19 to 25 FIRST STREET, San Francisco. Cal.

A Desirable Bargain.

Mr. Lee H. Utt, of Pala, San Diego county, offers for sale a share in his valuable place, consisting of 320 acres, and situated as described above. There is an Apiary on the ranch in successful operation. For this business it possesses marked advantages. Twenty acres are seeded to alfalfa and eight acres are in vines. The place has growing on it 420 trees, many of them in hearing.

The owner will warrant the Cavendish Dwarf Banana to grow as well here as in Florida. He has three now growing. The pasture now enclosed will keep 50 head of cattle. The ditch—which is large enough to run a mill—is stocked with trout, and has a fish pond 100 feet square, and full of fish. There is a nice warm spring, with hath house; the water contains sulphur, salts and iron.

The place possesses great natural advantages, and the present owner has not spared money nor labor to improve; hnt heing a valetudinarian he is not strong enongh to attend to the work. To the right kind of a man a rare opportunity is here offered. To such a person as will come in good faith he extends the invitation to stop on the ranch long enough to become familiar with its characteristics and capacities.

Parties can refer to I. Nast, stock broker, San Francisco, or to anybody of note in San Diego. The place bears the name of "Aqua Tibia." Address,

LEE H. UTT,
Pala, San Diego County, Cal.

N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the Continent. Its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

Thanks for Prompt Attention.

STOCKTON, June 26, 1875.

Messrs. Dewey & Co., S. F.:—

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

Mining Superintendent

Of Twenty Years' Experience in opening and working Mines, building mills and working gold and silver ores, especially those turned *Rebellious*, is open to engagement. Address, E. B. SMITH, this office.

$55 to $77 a Week to Agents. Samples FREE. P. O. VICKERY, Augusta, Maine.

NOTICE TO PARTIES ORDERING FURNACES.

The mining public is hereby notified that all persons who represent themselves to be my agents or to have authority under my patents to build and use, or to contract with others for the right to build and use a Cylindrical Rotary Roasting Furnace (except in Lander county, Nevada,) are frauds, and any person or persons that constructs one of my furnaces either with or without additions, alterations, or supposed improvements, or attempts to use one constructed under a contract with any snch unauthorized person, will he prosecuted as infringers of my rights on the premises. I have made arrangements to have all my furnaces constructed hy the Etna foundry, in this city, and no other foundry has a right to make one without my written consent. For rights to hnild and use, address

GEO. W. WHITE.

San Francisco, Aug. 22d, 1876.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices Ahundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circnlars forwarded, and full information given upon application.

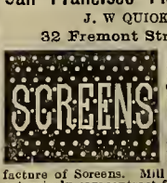
J. W QUICK, MANUFACTURER,

32 Fremont Street, San Francisco.



Several first premiums received for quartz mill Screens, and perforated sheet metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, SEPTEMBER 2, 1876.

VOLUME XXXIII. Number 10.

[Editorial Correspondence.]

The Centennial at Philadelphia.—No. 13.

The Government Building.

This portion of our national exhibition is no mere mercantile display. It is a great object school—at once a museum and an illustrated history of the country. Each of the departments has drawn upon its own resources for the material wherewith to fill its allotted space; the various objects have all an illustrative, historical or instructive interest, and appertain to the original inhabitants of the country, to its early settlement by whites, to the Revolutionary struggle or later wars, to the progress of the arts of peace, to inventions, to scientific researches and natural resources.

The Army and Navy.

The military man may here study from life-size models the history and changes of the army uniform. He can examine and study the various kinds of firearms, weapons, etc., which have been or now are in use. He can also witness in actual progress the manufacture of rifles, metallic cartridges, etc. The famous 20-inch Rodman gun, from the Rip-rap, is here, mounted upon a traverse, and looking as mute and solemn as though it could never carry death and destruction to an enemy miles away. Then there are two 15-inch guns, and numerous others, both smooth bore and rifled, of various calibers, down to the smallest in use, and just outside a large mortar lifts up its yawning mouth. Then we have the Gatling gun and Fieschi battery of guns, and all the various machine combination of small arms, whereby modern battle-fields are so often made such terrible places of carnage.

The Navy Department Display

Is also remarkably full and fine. It shows a wonderful collection of specimens of shot, shell, and all the paraphernalia connected with naval combats. Marine engines and boilers are exhibited of most curious and complicated make, designed for being placed in contracted and peculiar places, such as used often demands; immense cables with mammoth iron links seemingly sufficient to hold a dozen ships in the face of the most fearful gale; beautifully finished models of every class of ships in the navy, and specimens of every variety of naval stores from a ship's biscuit to a sheet anchor. Upon the outside and near the main entrance we have the *fac simile* of a monitor turret, with its two Rodman guns in position, showing just how these modern war engines are furnished and fought. Most visitors mistake it for a real turret; but it is only a shell of wood, of the ordinary dimensions of a turret, covered with heavy sheet iron. The weight of a real turret is about 250 tons, and consequently too heavy to be moved to such a locality. The work of placing the 20-inch Rodman in position was quite heavy enough to tax severely our best engineering appliances, and that weighs only about 50 tons. The art of submarine warfare is fully illustrated by various devices in model, but especially by a huge cigar-shaped real torpedo, about 25 feet long, with a propeller at one end, and an electrical apparatus at the other to guide and control its actions when sent upon its errand of destruction. In the naval as well as in the army section are shown the various hospital appointments employed in actual service.

The Smithsonian Exhibit.

This, to most people, is the most interesting exhibit of all. It occupies nearly one-quarter of the entire Government building, and presents a display such as has never before been attempted. It is full of marvelous interest and most useful instruction. Science, which has occupied an inferior position in previous expositions, has here been accorded her prerogative, and comes most honorably to the front. She reaches back to the very dawn of knowledge in bringing forth the subjects for her research. She teaches exclusively in the silent but impressive manner of object lessons, and the means at hand are most varied and almost without limit. The ethnological and archæological collection displayed here is something really marvelous. No other nation can equal it; in no previous year of our progress could it have been so fully realized.

The researches of science have taught mankind that the main force of culture lies in the encouragement and progress of industrial art. Industrial art led the early inhabitants of the earth to fashion flint knives, stone axes and mortars, stone arrowheads, bows, slings, fire sticks, etc.; then with digging sticks—the earliest implement of tillage—first raised man above the level of the brute, and gradually taught him to smelt copper and tin, and unite them into a hard alloy suitable for spear heads, axes, knives, chisels, improved digging tools, etc. Then, and not till then, did men begin to erect durable dwellings of wood and stone, and accomplish productive tillage, such as is required to maintain many people on small areas.

Thousands of years elapsed, and industrial art still made progress—slow it is true—but progress nevertheless; and we find implements and tools still further improved. Man had learned to forge, temper and weld iron—the most useful of all metals. Progress then became more and more rapid, until ships with masts and sails had supplemented the canoe; the mold board plow had taken the place of the iron-pointed stick or forked limb; the water wheel, the magnetic needle, the paper mill, the spinning wheel and, finally, movable types came, one by one, to aid man in his various avocations, and to add, by their presence and power, to the growing culture of mankind. Next came, in comparative quick succession, the telescope, the quadrant and compass, the puddling furnace, the rolling mill, the steam engine, the locomotive and labor saving machinery of a thousand kinds, and lastly the electric telegraph, to bind together the nations of the earth with a bond of social and commercial interest, which is constantly growing stronger and stronger and breaking down the partition walls of difference between the various tribes and nations. Such are the triumphs of industry, which have brought with them the highest forms of social and intellectual culture and built them upon a foundation which marks a world-wide difference between ancient and modern civilization.

A volume would be insufficient to make any adequate allusion to even the chief of the different matters of real interest in this marvelous collection. The wonderful *fac-simile* models and sun pictures of the cave cities and cliff structures of Colorado and Arizona alone furnish material for volumes. The entire exhibit is divided into four sections, which are again sub-divided for the ready convenience of careful inspection and study, and the entire arrangement is thoroughly systematic. The zoological and botanical collections are most carefully disposed and exposed for view and study.

The Wonders of the Patent Office,

Shown in this building, are nearly allied in interest and importance to the Smithsonian exhibit, and include many thousands of models properly classed and arranged. They represent the toil, study, hopes, disappointments and realizations of thousands of inventors, and embody all manner of mechanical motions, principles and technicalities.

The Postoffice Department

Has established a branch office in this building, where all who wish may have their letters directed. A system of postoffice boxes has also been arranged throughout the grounds for the collection and mailing of letters, as in the various cities of the Union. This arrangement is a matter of great convenience, and the business of this Centennial office is attended to with a promptness and urbanity which makes it really what it is no doubt intended to be—a model postoffice. Connected with this exhibit is a machine for the manufacture of envelopes, a sort of a paper-eating monster, which is fed at one end from a pile of small sheets of paper that are picked up one by one, drawn, as it were, into the very bowels of the monster, cut, twisted, folded, gummed, stamped, hung up to dry, and finally counted out at the other end into packages of a given number of envelopes, all ready to be boxed up and sent away to the stationer.

The Signal Service Board

Is also here, and the visitor is brought into close contact and permitted to see and examine all the ingenious devices and methods by which

CHAIN MAKING AT THE MECHANICS' PAVILION.

modern science is enabled to predict, on philosophical principles, those facts about the weather which, years ago, the almanac makers presumed to set down with such confidence, when they in reality knew nothing about it.

Miscellaneous.

Near by the above the Signal Service exhibits a very interesting model of the excavation works now going on to remove the obstructions to navigation at Hell Gate, near New York. The bottom of the channel is first shown, together with the topography of the adjoining shore, the coffer dam, the debris which has been raised, etc.; after which the attendant, by the aid of machinery, raises the bottom of the channel first shown, which forms the roof of the excavation that has been made below. By this means a model of the underground works is brought to view showing the galleries, pillars, etc., in miniature, as they actually exist. A better idea can thus be formed of this novel piece of engineering than can be obtained from an actual inspection of the locality itself. Workmen are now engaged in placing the cartridges of dynamite and nitro-glycerine, which are to be exploded about the 5th of September. It will no doubt be recollected by most of our readers that the well known San Francisco engineer, A. W. Von Schmidt, first conceived this plan of removing sunken rocks, gave it a successful demonstration in the removal of Blossom rock in the harbor of San Francisco, and subsequently obtained a patent for the process. Mr. S. has recently commenced a suit against the United States for an infringement of his patent in the work which we have described.

W. B. E.

Dom Pedro is going to Ephesus to visit the site of the Temple of Diana.

Chain Making.

There is probably no one industry upon our coast that is more difficult to establish on a fair paying basis than that of chain making. The inclination of the average American to purchase anything that "will do," provided it is cheap, and the extreme low price at which the prison made chains of the Eastern States are offered in our markets, is the prime obstacle in the way. Where chain must be had to fit a wheel, or for special purposes, and where great strength is required without extra size being admissable, our local chain manufacturer must be called upon.

The only local chain manufactory here is that of the Pacific chain works, J. E. Gordon, proprietor. These works were established in this city in the early part of 1874, by the present proprietor, although he did not assume the management until about a year ago. Previous to that time it was conducted by the workmen themselves in their own names, Mr. Gordon simply furnishing the capital. This plan, however, did not work, the men being unsteady, and a quarrel and separation ensued. Mr. Gordon thereupon took the matter into his own hands, securing an entirely new set of men, under the supervision of Mr. Peter Davies, who has been nearly 50 years in the business, having come from Philadelphia, where he was serving as foreman in one of the leading chain factories in the United States.

The number of men employed varies from five to fifteen according to the amount of work on hand. Chinese labor is utilized for sifting coal and menial work only, although they manifest a strong desire to do the mechanical part and acquire a knowledge of it with surprising rapidity. With a laudable disposition to encourage white labor, Mr. Gordon has, as yet, given them no opportunity.

The iron used in the manufacture of chain at these works is rolled to order especially for the purpose, from selected scrap, by the Pacific rolling mill, in which company Mr. Gordon has been a stockholder since its organization. As a large portion of the chain shipped from the East is made by prison labor, and of a very poor quality of iron, it would seem that Mr. Gordon should be entitled to a better price for his product, but such is not the case; he has to compete with the price of poor chain, and even then finds it difficult to secure a fair portion of the business for our local factory. His specialty is manufacturing extra quality of chain to fit wheels and machines for mills, mines, factories, etc., also ship's cable chains. To give an idea of the variety of chains manufactured at the works, we copy from the card as follows: Crane, cable, dredging and crown proof coil chains, log, raft, safety, railway car, ship and bridge chains, back and trace chains, plain or twisted, pole, lock and stay, coal mine and sugar mill chains.

The engraving in connection with this article represents the forge of the Pacific chain works in the machinery department of the fair, and is probably familiar to many of our readers, as it has so far been the center of attraction at this exposition, the crowd around it at all times being so great as to scarce admit of a sight of the workman without waiting a long time. He is engaged in manufacturing ordinary coil chain, size three-eighths inch, a leading size among hardware dealers. The same kind is also worked up into trace, hack, pole, stay, and other kinds of chains. Old farmers and mill men often inspect the separate links one after another to assure themselves of the integrity of the weld, and all express satisfaction. The quickness with which the work is done is a source of surprise to all.

The works are located near the rope walk at the Potrero, on the corner of Iowa and Yuba streets, in a building 30x50 feet, erected by Mr. Gordon for the purpose, on some of his own land. Just in the rear, in connection with it, there is a four-roomed cottage where the workmen live.

The office is at Mr. Gordon's store, No. 349 Market street, where all orders and enquiries should be addressed. The business is an important one and capable of being considerably extended, but Mr. Gordon, having a large wholesale hardware business on his hands, has so far been unable to spare the time needed to work it up.

CORRESPONDENCE.

Alpine County—Its Mines and Resources Past, Present and Future.

[Written for the PRESS by VICTOR HARLAND.—No. 6.]

Silver Mountain District.

In addition to the mines already mentioned, which are, at present, the only active mines in the Scandinavian canyon, there are many others, now held by private individuals, which deserve a more extended description than is possible for your correspondent to give at the present time. In the future, when these comparatively dormant locations shall in turn be developed, it may be of interest to the PRESS and its readers to note their gradual improvement as one by one they pass into the hands of capitalists preparatory to extended improvements. Therefore at present, what may be said of one will apply equally to a majority of the locations here made, especially regarding their general character and susceptibility of future value as mines. There are, undoubtedly, interspersed among those mentioned other locations which cannot justly claim the attention merited by others. It would be surprising, indeed, were not such the case; for as your readers are aware, at the time of a mining excitement, when a new district or locality is thrown open to the mining world, every available location is soon taken, and the spirit of desire for the possession of equally valuable lodes, causes prospectors in many instances to lose sight of the difficulties attending the development of new lodes, and, during an era of unusual activity or excitement possess themselves of lodes, which under ordinary circumstances they would pass with merely a superficial notice. This is a feature of the finish times of every mining district, and it is universally conceded by all who have followed its minutiæ that mining, in its many and varied forms, is the most alluring avocation known to man. During

The Earlier Period,

When this locality was first discovered and occupied, excitement and hilarity was of daily occurrence. The dense growth of the beautiful pine, the unsurpassed purity of the atmosphere, the facilities for an economical development of the lodes, and the splendid water privileges of the district, gave rise to the popular belief that at some time in the future this would be a region of great worth and unlimited business activity; and here permit me the prediction, that although years have elapsed since these discoveries were made, and but comparatively little work performed upon the individual locations other than shallow tunnel developments, yet, notwithstanding this long period of inactivity and the absence of methodical working, the ideal hopes indulged in by those early locators and hardy pioneers will ere long prove a reality, born not of mythical imaginations or momentary vagaries, but of facts and figures. Experience, long tried, have taught us that mere superficial openings in the mountain sides above the immense surface disturbances here revealed, are in the majority of cases utterly useless, while the capital necessary to promote and continue tunneling interests of such magnitude as appears in many places throughout the county, is not to be found with that ease first hoped for during the earlier experiences. In the description that will follow of the mines in these several districts, it will be noticed that in almost every instance this has been the method of prospecting, and in many cases, at mere nominal depths. This locality, as well as others, has seen its portion of such work.

The Pittsburg Mine,

Located south-easterly of and about one-fourth mile distant from the I X L, consists of four locations upon as many of these parallel lodes; the last of the series being a south extension of the last named lode. This was once a prominent company, of Eastern organization, with the office of the company located at Pittsburg, Penn. Nothing having been done upon the property for a number of years it has lately been re-located, the locations thus made forming the four claims as mentioned Under the old organization a tunnel was started, the initial point being located at some distance above the canyon lode, and continued until it had reached a distance of about 600 feet. At a distance of about 100 feet from the tunnel mouth their first lode was encountered, about 40 feet from surface. At this slight depth, the surroundings being taken into consideration, nothing more could reasonably be expected than appeared in the croppings above the surface.

This company, represented by the late John A. Thompson, (Snow-shoe Thompson) as superintendent, encountered the same difficulties regarding expenditures for development that has hitherto baffled the efforts of the Lady Franklin company. It has a good location for permanent works, a large area of surface, and a fair supply of good timber. To a company of men having sufficient means at their command to prospect the lodes by means of a shaft, the purchase of this property would be in every relation a good investment, and if properly developed would yield a goodly return for labor expended. To the north and south of these lodes are situated

Others of Like Nature,

But insufficiently worked, having nothing that would tend to develop the lodes below the canyon level. One of these, the Gould & Curry, is held by Wm. Mercer, Esq., the present superintendent of the Lady Franklin company. This location consists of a southerly extension of 1,000 feet on the lode first encountered in the Pittsburg tunnel, and is opened by a tunnel of probably 100 feet in length, cutting the lode at the slight depth of 50 feet. When penetrated, the lode shows a width of 10 feet and a very good quality of ore. Specimens of a nature unique and valuable have been extracted, the quartz appearing like ribbons of crystal, adhering in places to the porphyritic rock surrounding the lode, and showing throughout its crystal form the beautiful ruby ore. This location is admirably situated for deep working, and is held in high estimation by the owner. To the north of the Pittsburg locations are other lodes more or less developed by surface tunnels. Preparations are being made to resume work upon some of them upon assurance of success attending the test of the O'Harra furnace, now in process of erection at the Exchequer mill, of the quantity or quality of the ore discovered in these lodes the writer is not sufficiently acquainted to enter into details regarding it. The general appearance and position of the veins, and their existence within this mineral belt, is regarded as favorable for permanent working, and undoubtedly a majority of them are worthy of more attention than they have heretofore received. As we approach

The Mouth of the Canyon,

The Balaclava, Snow Shriek, Olive Branch, and others are noticed. The first named is regarded as fine property and in conjunction with two or three others, held by Thomas W. Leggett, has been surveyed by L. L. Hawkins, Esq., United States Deputy, and a patent will undoubtedly follow in due time. Reaching the mouth of the canyon the Scandinavian lode of massive proportions is encountered. This has also been lately relocated and will be further prospected ere long by the present claimants A tunnel of 600 feet or more has been driven from near the base of the mountain, but work was suspended before the lode was reached, thus adding another to the long list of undeveloped claims abounding in this region. It is estimated that the lode will be penetrated at a point approximating 300 feet in advance of the face of the tunnel. The outcrop is fully 20 feet in width, with a strong, bold outline, and judging from its appearance on the surface and assays of rock from different points on the lode, it will develop finely at a reasonable depth below the tunnel level. An advantageous site for hoisting works is easily attainable within the lateral boundaries, thus making it a desirable location for investment of capital. From the mouth of this canyon to the divide—a distance of two miles—the

Evidences of Mineral Wealth

Beneath the surface is noted by all who visit the locality. A good wagon road, now almost exclusively used by the Exchequer company, is constructed from the base of the mountain to the works of the last named company. A sufficiency of the finest timber of the Sierras abounds on every side, and the time is not far distant when the general tenor of business—now comparatively inactive—will be greatly changed. To the capitalist this region holds forth every inducement necessary for safe investment, and that it is already becoming more popular in outside circles is attested by the significant visits lately made by parties interested in mining, and subsequent purchase from former claimants.

Magnitude of our Hydraulic Mining Enterprises.

Few people abroad, and not many even in California, have any adequate conception of the extent to which large and valuable mining estates have been gathered up and consolidated by some of the hydraulic companies operating in this State, nor yet of the length of time and the expenditure of money that have been required to effect these objects. Many otherwise well informed persons have an idea that these companies, like those organized for silver mining, spring up in a day, and with a gourd like growth are ready for business; that it is possible for them to commence work with little capital and on short notice; only a claim of some sort, an office with a board of directors, a president and secretary, and set of blank stock books, being necessary for entering upon practical operations and insuring a financial success. Nothing, however, could be more mistaken than a notion of this kind. Very different sort of institutions are these hydraulic companies from the majority of those formed for ore working; the washing of auriferous gravel being, as a general thing, carried on in a spirit very unlike that which so largely governs those engaged in vein mining. The properties of the hydraulic miner, difficult of acquirement and varied in character, have, in most instances, been aggregated only through long years of careful watching, good management, and at a heavy cost to the owner. Not often bought for speculative purposes, they have been improved with economy and administered with a view to insuring steady and profitable production; this department of mining, where the conditions are all favorable, offering to those desirous of making permanent investment, as good inducements as any other industry in the State.

The following extract from a late issue of the *Bulletin*, descriptive of the possessions of the Eureka Lake and Middle Yuba canal company, situate on the San Juan divide, Nevada county, conveys a good idea of the dimensions, varied character and value of one of the largest and best managed of these great mining estates in California.

This property, composed of mines, water rights, ditches and reservoirs, tailing and tunnel claims, saw mills, wood lands, etc., has been acquired by the present owners while residing here, engaged for a period of more than 20 years in mining, trading and banking, and who, familiar with everything on or pertaining to the ridge, have from time to time secured the same, locating some and buying others when favorable opportunities offered for getting hold of choice tracts of gravel or other interests suited to their purpose, which was the aggregating of, not only an extensive, but a complete mining estate, possessing in itself everything necessary to carry on hydraulic operations on a large scale with the greatest attainable success. The gold-bearing gravel owned by this company covers an area of nearly 2,000 acres, the bulk of it lying along the old channel near Columbia hill and Cherokee, with considerable tracts at Lake City, North Bloomfield, Relief hill, Snow point, Moor's flat, Woolsey's, San Juan, and elsewhere on the ridge. They own, convenient to their mines, large tracts of wood land, with both steam and water-driven saw mills, whereat they cut enough lumber and sluice blocks for their own use and the country around. Among the appendages of this estate are extensive deposits of rich tailings, bed rock tunnel sites, outlets, commanding other grounds and various similar appurtenances and franchises of minor importance; its feature of greatest value, not excepting the mines themselves, consisting of.

Water Rights, Ditches, Etc.

The following is a list of the ditches now owned by this company, all being works of large capacity and the most of them of great length. The Eureka lake, San Juan, Middle Yuba, Miners', Grizzly and the Irwin; besides which they own a great number of subsidiary ditches, used to convey water from the mains and the local reservoirs upon the mines. These principal ditches have a united length of more than 200 miles, and a capacity to deliver about 10,000 inches of water, the quantity now being carried by them, and continued with little diminution till winter, being 6,000 inches. The average amount delivered throughout the year, reaches about 200,000,000 gallons per day, enough to meet the wants of San Francisco for all time to come. The cost of these ditches, the most of them having been built at an early day, was large, not less in the aggregate than $1,500,000. The Eureka especially was an expensive affair, the Magenta and National flumes, famous for a long time as the most extensive and costly structures of the kind in California, having constituted sections of this ditch. Being liable to destruction from wind, fire and early decay, the company, upon their being blown down some years ago, lowered the line of their ditch at that point and substituted trenches for these lofty and expensive but perishable works.

Water-Shed and Storage.

The principal reservoir of this company consists of Eureka, French, or Canyon creek lake, as it is variously put down on the maps. It is capable of holding 933,000 000 cubic feet of water, which quantity, by raising the dam built across its outlet 12 feet, could be increased more than one-quarter. Four miles further down Lake Faucherie has in like manner been converted into a reservoir, in which can be retained 217,000,000 cubic feet of water, the several small lakes in the neighborhood having a capacity to hold a further quantity of 100,000,000 cubic feet, giving to these various receptacles a water storage of 1,250,000,000 cubic feet, equivalent to 10,000,000,000 gallons of water—as much as the large ditch leading from these reservoirs is capable of carrying off in five months. Besides these storage reservoirs the company have 35 distributing reservoirs located in the vicinity of the mines, and having an aggregate capacity of 25,000 inches. The water-shed having its principal drainage into these lakes and supplying streams covers an area of several hundred square miles, much of it consisting of peaks and ridges of naked granite. Flowing in the form of melted snow from the rocky summits and slopes of the Sierra this water, when first collected, is as pure as this element ever occurs in nature.

Water Sales. Receipts, Etc.

Though working but a portion of them, this company own more than a dozen well opened and outfitted mines, all rich and in good shape for running. To some of these claims outlet has been secured through long bed-rock tunnels, the extent of these excavations covering many thousand linear feet, the length of monster pipe and flume laid down being reckoned by the mile. Several of these mines are leased to other parties, a number being suffered to lie idle, the owners preferring to supply water to those who have long been their customers to using it in their own claims, though this would afford them larger profits. This company sell their water at the rate of 10 cents per inch for a run of 12 hours, a rate that could be materially advanced without diminishing their sales, were they disposed to be exacting. Before they were consolidated the receipts of the Middle Yuba canal company from water sales amounted to about $150,000 per year, having aggregated during eight and a half years, beginning January 1st, 1856, nearly $1,000,000; the receipts of the Eureka Lake company for three years, commencing January 1st, 1860, having amounted to $625,000, their expenses being meantime $120,000. While the revenues arising from this source are not so large now as formerly, the Consolidated company using most of their water themselves, the net earnings realized from working their mines and from sales of water greatly exceed the income formerly derived from water sales alone.

At Columbia Hill,

Where this company are carrying on their principal operations, they own one of the most valuable deposits of gravel in the State, the auriferous belt here being over a mile wide, and varying from 200 to 600 feet in depth. This material, which pays from top to bottom, being of high grade throughout, is entirely free from adhesive clay, layers of sand, boulders and other troublesome matter, enabling washing operations to be prosecuted cheaply and continuously. The manner in which this ground has been exploited and equipped is nowhere excelled. A description of the disintegrating and gold saving apparatus here employed would cover all that is most new, powerful and advanced in hydraulic mining. The monitors used have an outlet diameter of 15 inches, being a third larger than any other ever constructed. The main flume is 6,000 feet long and eight feet wide, an unusual size. Most of the time as much as 3,000 inches of water are run in this claim under a pressure of 300 feet, supplying a force that tears down and carries off immense quantities of this easily separated gravel. In the pit already washed out here all the exhumed cities of Italy could be set down, with room to spare. Still, the ground disposed of bears so small a proportion to the remaining mass that it is scarcely missed; and yet mining has been going on here pretty briskly for more than 25 years—this being one of the earliest, as it has always been one of the most active camps on the San Juan ridge. To figure on the probable time required to empty even a linear mile along these old river channels would be to busy ourselves with the events of another century.

Altitude of Our Hills.

Professor Davidson has for some time been engaged in taking observations from the top of Monte Diablo, and furnishes the following list giving the height of hills in sight from Monte Diablo:

Clay street hill, San Francisco, has an altitude of 337 feet above ocean level, and is distant 32 miles.

South Farallone island, 350 feet altitude, distant 66 miles.

The sea horizon is distant 83 miles.

Mount St. Helena, 4,343 feet altitude, distant 68 miles.

Mount Tamalpais, 2,604 feet altitude, distant 39 miles.

Snow Mount, south-west angle of Mendocino county, 7,000 feet altitude, distant 114 miles.

Mount Monticello, west of Cottonwood, 3,030 feet altitude, distant 57 miles.

Mount Vaca, west of Vacaville, 2,340 feet altitude, distant 35 miles.

State Capitol, Sacramento, distant 53 miles.

Marysville Butte, 2,039 feet altitude, distant 92 miles.

Lassen's Peak, 10,650 feet altitude, distant 183 miles

Downieville Buttes, 8,720 feet altitude, distant 157 miles.

Lola Mount, near Truckee, 9 230 feet altitude, distant 138 miles.

Pine Hill, near Folsom, 2,150 feet altitude, distant 77 miles.

Pyramid Mount, 10,290 feet altitude, distant 114 miles.

Round Top, overlooking Placerville road, 10,650 feet altitude, distant 120 miles.

Stanislaus Peak, 11,500 feet altitude, distant 125 miles.

Mount Lyell, about 10,000 feet altitude, distant 144 miles.

Mount Hamilton, site of the Lick observatory, 4,300 feet altitude, distant 52 miles.

Santa Lucia range, south of Monterey, 6,200 feet altitude, distant 132 miles.

Mount Bache, north of Santa Cruz, 3,790 feet altitude, distant 54 miles.

The area actually within view from the summit, including land and ocean, is computed by Professor Davidson to be about 32,000 square miles.

SWITCHMEN SOUNDING THE LOCOMOTIVE WHISTLE.—On some of the French railway lines an arrangement for giving notice of danger is in vogue, as follows: The signal or switch man, when he turns the disk, sends an electric current in the direction of the coming train to a bar placed between the rails, and when the engine reaches the spot, a metal brush placed between the wheels sweeps the cross-bar, the current passes to the engine, and, by means of an electro-magnet, presses upon a lever, which opens the steam whistle, thus bringing it virtually under the control of the switchman on the road. From its simplicity, this arrangement is regarded as preferable to most of the other devices for this purpose.

MECHANICAL PROGRESS.

A Boot Polishing Machine.

According to the *Ironmonger*, we shall soon take our daily "shine" by machinery. We read as follows: A great many attempts have been made to produce machinery for cleaning boots; but up to the present it may be said that none have been really successful. All that we have ever heard of have been composed of revolving brushes, against which the boot has had to be held. The brush has been caused to revolve by means of treadles or similar contrivances. The labor, therefore, of cleaning boots must have been as great as if the boots were cleaned by hand, and the polish far inferior; for the brush revolves always in one direction, and to polish leather brilliantly there must be a backward and forward movement of the brush. Mr. Southall, of Leeds, appears to have overcome the difficulty, for we have been favored with a drawing of a machine which he has patented, which seems admirably adapted for doing its work. The machine is only about the size of an ordinary sewing machine, with stand. Through the frame of the machine, in bearings, is placed a horizontal sliding shaft. A worm wheel in one of these bearings acts as a fixed for turning round the boot. A vertical rocking bar works between two centers, and carries an arm lever, on the end of which is fixed the brush (an ordinary flat one.) The brush end of this arm lever is made to rise or fall, according to the inequalities of the boot upon which it rests. The driving shaft is a short horizontal one, and carries a worm for turning the feed, a fly-wheel and crank and joint for pulling the brush backward and forward. There is an expanding last, made so that it will suit all sizes and sorts of boots. All that a person has to do is to slip a boot on the last and tighten it, lower the brush so that its weight rests on the boot, and then turn an ordinary handle, when the boot begins to move slowly round, and presents every part it is intended to clean to the brush, whilst the latter works backward and forward with rapidity, and the result is a most brilliant polish, which it would be vain to attempt by hand. The machine is so easy to turn that a child of nine years old can work it. It has only just been introduced to the public, and we believe will be exhibited for the first time at the Manchester and Liverpool show at Southport, where, no doubt, it will be an attraction.

NEW IRON MAKING PROCESS.—The members of the Manchester scientific and mechanical society paid a visit to the Standard iron and steel works (formerly Bolckow, Vaughan & Co.), Gorton, to inspect a new process for making iron and steel, patented by Mr. Samuel R. Smyth. About six to seven tons of common scrap iron were melted in an ordinary cupola, and run into a Bessemer converter, the current of air from the blowing engines being used to introduce certain chemical compounds and reagents into the molten metal for the purpose of eliminating impurities. This was done at a sacrifice of only a small percentage of iron. The process of refining and purifying occupied between nine and ten minutes, and the quality of the production appeared to be in every way satisfactory. Both grey and white iron can be produced of a high specific gravity and of great density. A number of test bars made by Mr. Smyth's process from grey iron were submitted for inspection. The cast-iron test bars were one inch square and four feet eight inches long, and at the time of testing were placed upon supports four feet six inches apart. The weight was suspended in the center on a knife-edge, the deflection measuring every 100 pounds up to 600 pounds. The total deflection was found to be 1·375 inch. The weights were then gradually removed, and when all were off the deflection was found to be about 0·062 of an inch only. The weights were again placed in the scale, and the deflection again taken. When 720 pounds was registered the deflection was 2·078 inch. The average breaking weight of five samples was 733·6 pounds. The material works as easily as ordinary cast iron. Altogether the process seems likely to fulfil the sanguine expectations formed of it. The works have only been in operation a few days, and it is intended to erect an apparatus for making wrought iron of high quality in large masses without piling or welding.—*Manchester Examiner.*

PIECE WORK.—In a report drawn up by the deputation of workmen who were sent from Paris to the Vienna Exhibition three years ago, and only now published, the following arguments are advanced in favor of piece work: "In most of the Paris manufactories and workshops workmen are paid by the hour. Now, it always happens that the employer fears that the amount and quality of the work executed are not worth the price he pays for it; the workmen, on the other hand, being underpaid, is always afraid of doing too much. In self-defence, the employer resorts to vexatious precautions which are of no use to him, and which only excite the resentment of the workmen—a resentment which he loses an opportunity of displaying. This latent animosity between the employer and the workmen is to be deplored in the interest of both parties, and the best way of putting an end to it is to adopt the principle of piece work, by which the independence of the workmen is effectually secured."

Speed of Wheels and Pulleys.

Although we are constantly solving problems as to the speed of wheels of a given dimensions and the dimensions of the wheels revolving at given speeds, inquiries on this subject come to us in such numbers that we cannot do better than give some plain, authorative rules which all mechanical readers will do well to remember. We find in *Iron* the following concerning calculating the speed of wheels and pulleys.

To find the number of teeth in a gear wheel, revolving at a given speed: Multiply the speed of the driving wheel in revolutions per minute by the number of teeth it contains, and divide by the speed of the driven wheel, and the quotient is the number of the teeth required. Example: If a wheel contains 50 teeth and makes 25 revolutions per minute, what number of teeth must a wheel contain to gear into the first, if it makes 125 revolutions per minute? $50 \times 25 = 1250 \div 125 = 10$, the answer. For pulleys, or hand wheels, the rule is the same, except that the diameter of the wheel is taken instead of the number of teeth. Example: A driving wheel is 24 inches in diameter, and makes 120 revolutions per minute; what size of pulley must be used to obtain 60 revolutions per minute? $120 \times 24 = 2880 \div 60 = 48$, the answer.

Another rule, which will answer whether we employ a single pair or two pair of pulleys, is as follows: Divide the speed required by the speed of the driving shaft, and the quotient will be the proportion between the revolutions of the driving shaft and the revolutions required. Then take any two numbers that will, when multiplied together, give a product equal to that proportion; one of such numbers will form the relative proportion between the sizes of the first pair of pulleys, while the other number will form the relative proportion between the sizes of the other pair. Example: It is required to run a machine at 1,200 revolutions per minute, the driving shaft making 120 revolutions per minute. What size of pulleys should be used? $1,200 \div 120 = 10$. Then: $5 \times 2 = 10$, or $4 \times 2\frac{1}{2} = 10$; so that the proportion being 10 to one, we may use two wheels of any sizes, provided that the one on the driving shaft is ten times as large as the one on the machine. Or since $5 \times 2 = 10$, we may place on the driving shaft a pulley 5 feet diameter and belt it to one of 1 foot diameter, thus forming the proportion between the first pair of wheels of 5 to 1. The next pair of pulleys must be in the proportion of 2 to 1, that is to say, we may belt together a 2-feet and a 1-foot pulley, a 4 and a 2-feet, or any others, so that one is twice as large as the other. Again, since $4 \times 2\frac{1}{2} = 10$, our first pair of pulleys may have the proportion of 4 to 1, and the second pair the proportion of $2\frac{1}{2}$ to 1, or *vice versa*, as circumstances may require.

It is obvious that, when the speed of the driving shaft is less than the speed required, the larger pulley of each pair must be used as the driving wheel.

MACHINERY OF THE BRITISH FLEET.—The Newcastle *Chronicle* says: "Some curiosity having been manifested as the cost of machinery supplied to the vessels of our fleet, it may not be uninteresting to give a few figures on the subject. The contract for the engines of the *Thunderer*—now disabled at Portsmouth—was £46,500. The estimate for the hull was £250,000; but as this did not include guns, or the extra cost involved by her hasty preparation for sea, it is not unlikely that she was worth fully £450,000 when she blew up on Friday last. The cost of the *Cornwallis*, a 60-ton gun ship, built twenty years ago, was £12,206 for boilers and engines, and about £73,000 for hull and entire fitting. The machinery of the *Bellerophon* cost £86,960; that of the *Agincourt*, £83,779, the *Hercules*, £82,814; the *Northumberland*, £7,871; the *Minotaur*, £79,500; the *Warrior* and *Black Prince*, £74,000 each; and the *Achilles*, £69,000. Of these ships the *Northumberland* was the most expensive, costing £471,352; the *Agincourt*, £465,477, and the *Minotaur*, £456,830. The outlay on the ships now building, however, is considerably greater. The *Dreadnaught*, an armor-plated turret-ship of four guns, is to cost no less a sum than £508,395, and of this $107,000 is set apart for machinery. The *Alexandra*, a broadside ship of twelve guns, will cost £411,980 for hull alone, and the contract price for her engines is £110,500 more."

BEATING ENGLAND ON HER OWN GROUND.—To previous intimations in earlier reports touching the competition of America and France in the tool and hardware industries, the Birmingham daily *Post* is now directing the attention of its readers. That paper says: "During the past few months a French manufacturing firm has established an agency in Birmingham, and has supplied large quantities of the hardware peculiar to Birmingham and its district at prices considerably lower than those of native manufacturers, such articles being, nevertheless, frequently made from Staffordshire iron and Sheffield steel. Another significant hint as to future competition, not only in foreign and colonial markets, but even on English soil, is the list of prices of several American manufacturers, who are supplying not only axes and steel forks, for which they have long been famous, but a great variety of hardware goods. Not only the business-like style of these lists of prices, and the artistic character of the illustrated lists, but the style and excellence of these American manufactures deserve the serious attention of employers and employed."

SCIENTIFIC PROGRESS.

Insanity in the United States.

The intelligent care of the insane, with a view to the restoration to health and society, is so recent that it may be dated, in the United States, in the present century. The time is even within the recollection of many now living, when faith in the curability of the disease became general, even among medical men. Upon the dawning of the belief that insanity was susceptible of cure, hospitals began to be built, for the two-fold purposes of custody and treatment; for besides the difficulty of taking care of lunatics at home, it was found that comparatively few recovered. From this period hospitals began to be regarded as not only the best, but to most persons the only places for the insane. Hence an increasing demand for their accommodation; and though their numbers have multiplied largely, and have greatly increased in size, they are still inadequate to entertain all who knock at their doors and with piteous appeals seek admission. In this connection may be noted a curious result of the establishment of new hospital facilities. The newer States, in estimating the hospital capacity necessary for their insane, have naturally consulted the census statistics to find what number to provide for; but it is invariably found that when a hospital is opened for the accommodation of a given district, the applications for admission far exceed its capacity, largely outnumbering the statistics collected by the census-taker. The country seems suddenly thronged with insane people, and we are apt to be impressed with the belief that this dread disease is largely on the increase. But the probable fact is that no such increase really exists. It is not unnatural that, mainly out of family pride, the questions of the census-takers are often evaded, and the relatives of the unfortunate patient, seeing no benefit to come from revealing this "skeleton in the closet," keep it from observation. But, promptly when an asylum is opened within their reach, free to all without pay, the curtain is drawn and they come forward with their afflicted.

That insanity does not increase, *pro rata*, at least in the United States, is proven by the census returns for the past twenty years. In 1850, this country had a population of 23,191,876, and a total number of insane and idiots of 31,397, or 1 in 378. In 1860, with a population of 31,443,322, there were 42,864 insane and idiots, or 1 in 733. And in 1870, with a population of 38,555,983, there were 61,909 of that class, or 1 in 623. In England, during the same period, there was an average of about 1 in 450; in Scotland, 1 in 460; in Ireland, 1 in 400; in France, 1 in 600; and in Australia, 1 in 524. These reports, if accurate, show a favorable condition in this country as compared with that of others.—*Scribner's for September.*

METEOROLOGICAL.—*Iron* makes note of recent facts in the application of meteorology to industry: On the first of May last, agricultural weather-warnings began to be issued from the Paris observatory. While the forecasts made for the benefit of seamen and fishermen relate to the intensity and direction of the wind, those for farmers will have reference to the rainfall, thunderstorms and inundations. The last will occasion little difficulty; with the help of the electric telegraph, timely information of heavy rains and the first rising of the rivers will be collected and distributed to the dwellers on the plains. Data will also be collected with regard to all kinds of meteorological phenomena, and may we expect the predictions to become more reliable year by year. As an illustration of the indications which may be relied upon in foretelling change or continued favorable weather, an instance is given in which the latter was accurately forecast from the coincidence of a high and rising barometer in the extreme north of Europe with a contrary condition in Sicily. These indicated a continuance of the polar current, bringing with it clear skies and a consequent increase of temperature during the day, which were predicted and verified by the event. Professor Loomis has also shown that when barometers are high and temperature low in the Aleutian islands the reverse obtains in the United States, that a similar correspondence exists between Iceland and Central Europe, and that the amount of rainfall bears a well-defined relation to the pressure at the center of a storm.

ELECTRIC EXPERIMENTS.—M. Plante's most recent experiments with his powerful secondary batteries throw some light, he considers, on the formation of hail. Using a battery of 400 secondary couples, he placed the electrodes in a dish of salt water, and from the positive electrode (which was sometimes wrapped in a piece of moist blotting paper) there were thrown up in all directions a multitude of ovoid globules. If the electrodes meet only a moist surface, instead of a thick liquid layer, the calorific effects prevail, the aureole is more brilliant, and the water is quickly transformed into vapor. M. Plante thinks the electric discharges in clouds may, according to the density of these moist conductors, cause their reduction to vapor, or their instantaneous aggregation into globules much larger than the cloud globules themselves, and the liquid bombs thus formed may be projected to great heights, where the temperature is much lower. This he gives as one possible way of the production of hail.

Local Botanical Points.

At the last meeting of the California Academy of Sciences, Dr. A. Kellogg gave a report on a dozen or more plants, some of them new species and the others in certain respects peculiar. These included a species of phacelia found by Sam. Brannan, Jr., in 1871, at the top of Granite mountain, Kern County. The flowers are purple-blue, and the stems shaded a little with yellow. Plants of this species are highly valued for the garden. Dr. Kellogg christened the specimen after the finder. A new species of the wild pea, brought from Southern California by Mr. Hutchins, was exhibited, and the name given to it is *Macrocarinatus lathyrus*. It is, perhaps, one of the most ornamental yet discovered. The stem is perennial, and it twines round large bushes, attaining a height of five feet, and hangs with large clusters of purple blossoms, larger than any known heretofore of this genus. Of a third plant, *A. psoralea*, left by Mr. McLane, a student at the University, and said to have been collected on Tamalpais, Dr. Kellogg did not think it possible to make a new species. He thought it probably a foreign plant that had got mixed up in the portfolio of the collector. A fourth plant Dr. Kellogg named the *Lupinus sericatus* from the satin-like appearance. The flowers are purple-blue. It was found in Lake county by a Miss Anderson. The stalk of a sun-flower, obtained in Owen's valley, was shown, with the remark that probably it would be included in the *Helianthus Californicus*, as a very distinct variety. The farmers say it has recently appeared in the vicinity. It has a white stem, very smooth, and as many as 300 blossoms form on one plant. As a feature for the park it is very valuable. Among other plants presented were specimens of *nemophyla* and *calindrinia*.

DIRECT PROOF OF EVOLUTION.—A correspondent of *Nature*, taking for his text Mr. Huxley's suggestion that "the sole direct and irrefragable evidence of the method whereby living things have become what they are is to be sought among fossil remains," shows that important work in that direction has been lately done by three Continental scientists. M. Paul, of the Austrian geological survey, in conjunction with Dr. Neumayer, of Vienna, a distinguished palæontologist, have recently discovered most interesting proofs of the origin of new forms by a descent in a large accumulation of lake and lagoon deposits of the latest tertiary, which extend over a great portion of the Hungarian plain. The beds are about 2,000 feet in thickness, and the upper fresh-water series, by far the thickest portion, contains a number of well marked zones of molluscan life. The existing genus Palndina is in great profusion, and about 40 forms have been distinguished which clearly illustrate the mode of derivation of the newer from the older types. Intermediate links between forms so differentiated as to have been placed in different genera by competent naturalists have been found, and those differing forms have been thus traced to a common ancestry. Uniformity of physical conditions during an immense period renders these vast lake deposits very favorable for such investigations; but Dr. E. Mojsisovics has also, in a recent monograph, shown very clearly the relations of the molluscan forms of the Alpine triae to their ancestral types in the mesozoic and palæozoic strata. This is a comparatively new department of observation, but from the interest now taken in the question of evolution it will doubtless be more and more worked out.

NEW PROCESS FOR THE MANUFACTURE OF DEXTRIN.—M. Anthon writes to the *Chemical News* as follows: "At present, fecula in the separate state is exclusively employed in the preparation of dextrin, all that portion being wasted which is retained by the fibrous part of the potato or of the bran. To prevent this loss the author recommends the use of the entire potato dried and ground after being freed from its soluble principles by washing in acidulated or alkaline water. The fecula thus obtained is sprinkled with hydrofluosilicic acid (0·5 to 1 per cent. of the weight of the fecula); it is then placed in a drying room at 38 to 44 degrees till there is no further loss of weight; the temperature is then raised to 70 or 75 degrees till no loss occurs, and finally to 90 degrees. The dessication being thus complete, the fecula, whilst still hot, is placed in large flat sheet-iron troughs which are introduced into large stoves heated at 100 to 125 degrees. The transformation into dextrin is known to be complete when a sample taken out, on being cooled and moistened with cold water, adheres together in little glassy globules."

PRIZES FOR A NEW BLEACHING AGENT.—A Vienna industrial league offers a silver medal to any one who will discover a method of bleaching every kind of silk perfectly white without the use of sulphur or other chemical injurious to silver. In embroidery and silver lace where silk and silver are used together, the silver is blackened by the sulphur in the silk. A similar prize is offered for the most beautiful and solid domestic article for weighting light-colored silks.

THE ARRIVAL OF PROFESSOR HUXLEY.—Professor Huxley, the celebrated English scientist, has arrived in this country. He is at present traveling privately, and will devote the greater part of his brief visit to the Centennial Exposition. It was not his intention to deliver any lectures here, but he has lately reconsidered his determination, and has consented to give three discourses during the latter part of September, in New York city.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

EXCHEQUER.—Alpine *Chronicle*, Aug. 19: This mine, like good wine, improves with age. First-class ore is being taken out and sent to the mill. The force at the mine is being increased almost daily, and as soon as the mill is started a larger force will be required.

ANVANCE.—This shaft is down about 340 feet, and we learn that good quartz has been taken out this week.

ALAMEDA.

BLACK HAWK COAL MINE.—Alameda *Independent*, Aug. 18: This coal mine has not been spoken of by us for some time, but it has not been neglected by its enterprising owners, who have been steadily at work in their efforts to develop it. It is found a few miles from Niles, not far from the Alameda creek, beneath a mountain about 2,500 feet high. There are four men constantly employed—two by day and two by night—on the tunnel they are running in under it to reach the vein. Their tunnel is five and a half by seven feet in size, and already run in a distance of 670 feet in length. Dark slate and gray sandstone form the material that they are now working through, and in five or six weeks more they expect to strike the vein. They cart out the refuse material of the rock that they blast and break up in the shaft upon cars that run on a wooden track laid down for the purpose, which has a gauge of three feet. They have been obliged to put in an air pipe so as to supply the workmen with good air to breath. There is a current of water of four inches running out of the shaft all the while, which shaft is on an upward incline as one goes in of about an inch rise every 20 feet. It is by this aid of this water current that the supply of air is obtained for the air pipe used by the men who are at work. Wm. Hagan, of Centerville, put in this pipe, which works first rate. The only improvements outside consist of a wooden shantiee for the men to sleep and eat in. Nine thousand dollars have been already spent in doing the work that is finished. The owners have unlimited confidence in the value of the vein, as well as in the certainty of reaching it in a few weeks more. They have proved their faith by their works, and we hope the rich reward of their toil will soon be forthcoming in the shape of a mine abounding in first-class coal.

BUTTE.

NEW MINE.—Butte *Record*, August 26: Surveyor Knowlton has been to Mosquito creek during the past week, surveying a line of ditch for a company composed of R Cuibertson, John Chamberlin, George Davidson and others. He finds that water can be brought on the claim with a ditch five and a half miles long, and we understand that the company will, within a short time, commence operations. The ground, which is very rich, judging from the specimen dust shown us by Mr. Cuibertson, is on the ridge between the Mosquito Creek house and Feather river, about a mile and a half from the former place. Success attend your efforts, boys. There is many a rich deposit in Butte county yet unopened. All that is needed is one or two "strikes" to make our mountains teem with miners again as of old.

CONTRA COSTA.

PROMISING COAL VEIN.—Antioch *Ledger*, August 26: In a recent article concerning the Empire coal mine and the future prospects of the owners we stated that the grounds of the company embraced three separate and distinct veins of coal, known as the Clark, Middle and Black Diamond veins. The Empire owners are at present extracting coal from the Clark vein; they have also been sinking a shaft upon, and within the past week have opened the Middle vein, which is fully three feet in thickness and presents a quality of coal even better than that now being extracted from the Clark vein. Four hundred feet south of this is the Black Diamond vein. It is the intention to open all three of these veins and construct a railroad to Antioch, a distance of five miles over a comparatively level country.

CALAVERAS.

QUAKER CITY MINE.—Calaveras *Chronicle*, Aug. 26: Favorable developments are being made at the Quaker City mine, near the Junction. At present they are cross-cutting the ledge at a distance of 180 feet from the shaft in the 200-ft level. The prospects of the mine are encouraging in the extreme. A splendid chute of pay ore has been uncovered, the full extent of which has not yet been determined, although a level nearly 200 feet in length has been driven upon it. The mine is being systematically worked and we are sanguine that it will prove one of the best in the State.

BRADY MILL.—The alterations and improvements that for some time past have been making in the mill at the Brady mine are now completed, and everything is in readiness to commence crushing excepting the lack of the "plows" necessary to "agitate" the pulp in the pan. These articles will be supplied within a day or two, however, and it is probable that milling will be resumed Monday morning. The mill is now in prime order and condition, and we confidently expect that it will give a good account of itself when put in motion.

BLAST.—A blast of 27 kegs of powder was exploded in the Veith hydraulic claim on Tunnel ridge last Tuesday. The usual method of running drifts into the bank for the reception of the powder was adopted and the result of the explosion was all that could be desired. Piping has been resumed.

MURPHY'S CAMP.—The placer mining interests of Murphys are being prosecuted with good paying results, employing some 60 to 80 men. Some interest is again being taken in quartz, the projectors having the fullest confidence of success in their enterprise. An enterprise has lately been completed connecting, by a good wagon road, the town of Murphys with the property of the Calaveras gold mining company on Indian creek. The country is very rough, but an easy grade has been accomplished. I halted at the works of the above company and was kindly received by Mr. G. T. True and Mr. J. S. Niswander, the superintendent. A splendid 20-stamp mill, self-feeding, is crushing on rock being taken from their new shaft at the 200-ft level. The rock is rich in gold but somewhat refractory on account of the large amount of sulphurets it contains. All tailings are carefully saved, and in the opinion of Mr. Niswander they will soon have a good mine on top. The hoisting works are run by steam—the mill by water. Free water and abundance of timber should make this a valuable mine. Passing on toward Sheep Ranch I pass Wood's mine, which had that day received engine and boiler for their hoisting works. The mine being off my route a little, though in sight, I did not visit it and am only able to give the statement of disinterested parties that the promises of the mine are exceedingly flattering.

SHEEP RANCH.—The Ferguson & Wallace mine I presume is the best paying quartz mine in the State, when working expenses are considered. Their compact little five-stamp mill is working night and day on rock from their 200 ft level, which has averaged $70 per ton, not assorted, but as it comes from the ledge. Their new hoisting works are a most accomplished piece of mechanism, and their engine runs as smoothly and firmly as it is possible to make it. Messrs. Ches. Clarey & Jim Harkins have taken a contract to run a tunnel for Norman and Bill Clarey in their Pioche ground, running on vein matter, and when completed will drain the mine to a depth of 400 or 500 feet. Peter Davis has shafted upon his Good Hunter to a depth which assures him that he has in that claim possibly the best mine that no has ever discovered. He now commences a tunnel which will drain the claim some 400 feet below the croppings.

FRESNO.

THE NEW PLACER MINES.—Fresno *Expositor*, Aug. 16: The new placer mines, located on Old Mill creek, in the eastern portion of Fresno county, are creating considerable excitement hereabouts. Ever since L. A. Clarke exhibited the specimens of gold that he found on Mill creek, parties have been leaving almost daily for the new mines. A mining district has been organized under the name of the Centennial mining district, and by-laws have been adopted. On Monday we met Mr. Clarke, and from him gained many particulars regarding the mines. They were first discovered by N. Harlan, an old miner. The gold seems to be coarse wash gold, although many of the pieces bear evidence of being drift from some quartz vein. In appearance the gold resembles that taken out on Sycamore creek, which was the purest gold dug in the county, bringing $18.50 per ounce. Several large nuggets have been taken out, the largest weighing over $22. The mines lie in the bed of the creek, and there being a large quantity of heavy boulders, it renders mining rather difficult. There is not enough water for washing, but there is an abundance for prospecting. The prospects are so good that these who have located claims feel confident that they will make a raise, as in winter the creek carries plenty of water for washing the dirt. The reason why the mines on this creek have never before been discovered, and worked, probably arises from the fact that in the winter the stream is so high that the gold channel is entirely covered, but the existence of gold there was known to many of the old miners of this section.

MARIPOSA.

THE BANDERITA MINE.—Mariposa *Gazette*, Aug. 26: During the past week we have been favored with a visit from Mr. Levi Keyes, the general superintendent of the Banderita and other quartz mines, situated above Coulterville, in this county, and to whom we are indebted for several items of interest. The Banderita is well and favorably known, and is entitled to rank with first-class mines. It has had many difficulties to contend with, one of which is the dissatisfaction of small creditors to give indulgence and wait until the superintendent makes his periodical clean-ups. No better evidence need be wanted of the richness and productiveness of this mine than the fact that during the past four years fully $160,000, taken from it, have been paid out for the machinery placed upon it, for provisions and for hired labor. The company have a 10-stamp mill, run by water power, and the old tunnel, which penetrates the mine about 300 feet from the surface, is upwards of 500 feet long. At this point a whim is constructed and a shaft sunk 175 feet, which develops a well defined vein of paying rock, eight feet thick. The company have upon the ground a Burleigh drill, and other machinery necessary for running a new tunnel, which will strike the vein in about 600 feet below the surface or outcropping of the vein, and 250 feet below the bottom of the shaft before alluded to. This work when completed, as contemplated, will, without doubt, be the greatest mining enterprise ever undertaken about Coulterville.

BLUE LEAN MINE.—This mine, recently purchased by Messrs. Tiffany & Hephurn, situated on Bull creek, 15 miles above Coulterville, is being developed as rapidly as industry can do it. A four-stamp mill has been erected and has been running about a month, crushing rock taken from the Scanlan mine, about four miles distant, and during the time a shaft has been sunk upon the lead. The Scanlan mine is bonded to Messrs. Tiffany & Hephurn for $40,000. Considerable work has been done upon it since it was bonded, and its former reputation of being a superior mine is holding good.

DOUGLASS MINING COMPANY.—This company, whose mill and mine is situated near the town of Coulterville, in this county, give employment to 75 men. They have a 20-stamp mill, driven by steam power, and have several valuable veins of quartz rock in the vicinity of the mill. Two of the most noted are the Potosi and Mary Harrison veins. An extensive hoisting apparatus, with a 40-horse power engine, have been constructed upon the Douglass, which will be complete and ready to operate by the first of September. The Mary Harrison, in her palmy days, produced gold in fabulous quantities, and her brows were wreathed in ringlets of the precious metals, but by bad management she fell from her high estate and lost her good name. Her character waned so low that she was in a fair way to be lost forever, but the good Samaritan, Mr. Gilbert Douglass, mining engineer and superintendent, extended a friendly hand to her, and now report has it that an eight-foot vein of good paying ore is reached, and Mary is in her pristine glory (if not purity) again.

NAPA.

THE IRON MINE.—St. Helena *Star*, August 23: We are pleased to note the return last Saturday of Captain Blasdell, and that he is making arrangements for a resumption of work on the Iron mine. Such an enterprise is full of importance to us, and cannot fail to benefit our local trade largely. We wish him every encouragement. A large quantity of ore will first be shipped below, before arrangements are made for reduction here. Work is expected to begin by September 1st, or very soon after.

REDINGTON MINE.—Napa *Register*, August 26: This great mine is still giving up the usual yield of a thousand flasks of quicksilver a month. Two new furnaces are in course of construction, which will greatly increase the product.

NEVADA.

BIG LEDGE.—*Foothill Tidings*, Aug. 26: Mr. J. F. Smith, an old Alpine friend of ours, now living at Washington in this county, sends us down some samples of rock from a ledge located by him last spring, which he says is 20 feet thick. The claim lies between the Yuba mine and Diamond creek, and the quartz before us looks similar in character to that from the Yuba. Though from the croppings it shows strong copper indication. We should say that it would be likely to prove a gold bearing ledge and one of great value.

THE Crandall gold, silver, iron and copper mining company filed its certificate of incorporation with the Secretary of State on the 19th inst. The ledge upon which operations will be confined at present is situated just below Boston ravine, on the hill opposite to where the old McCauley mill stood. It was located nine years ago and has turned out, from the yearly workings to hold the claim only, considerable rich rock, milling as high as $80 to the load. Early in the history of the claim the owners became scattered and for this reason no work has heretofore been done, beyond the amount yearly required to hold it. Under the new United States law the delinquent shares have been called in and the Crandall company intend opening up the mine through the old McCauley and Watts tunnel, which runs into the same hill some 400 or 500 feet, and it is thought will tap the ledge in about 200 feet more, thoroughly draining it and giving 70 to 80 feet of backs. It is said that at one time some of the finest specimen rock ever seen in the district came out of this ledge, and being in the Gold Hill and Rocky Bar range and very close to these celebrated rich ledges, one may safely calculate on its proving a very valuable mine when once opened up.

THE Godfrey mining company, sinking for a gravel deposit south beyond Alta Hill, near Mr. I. W. Weed's place, are down nearly 90 feet with their shaft, being over a third of the depth they expect to go to reach the ancient river channel below. Captain Godfrey, under whose direction this work is being done, has a theory and practice of his own in regard to the location of these gravel deposits, also of quartz veins and underground water courses, which, during a conversation had with him this week, we became very much interested in, and by his leave, which he has promised in due time to give us, we shall on some future occasion tell our readers something about it.

FRANKLIN.—Mill machinery all on the ground, and expected to be up and at work on the rich ore of that mine within eight weeks.

EUREKA.—The clean-up last week was 300 ounces of amalgam. North cross-cut No. 8 advanced 12 feet, and this More house cross-cut 15 feet.

HOMEWARD BOUND matters are progressing satisfactorily, and all who live down that way are looking for big things from this mine when properly opened—an Omaha and Allison Ranch combined.

NEW YORK HILL.—The new hoisting works are well along toward completion and a new office has just been built. The building covering the machinery is large and high, giving the best of dumpage.

A CONTRACT has been let to Thomas Miller to run the tunnel of the Crandall mine to the ledge. Work has already been commenced thereon.

THE Centennial company, working through the old Wide-Awake shaft on the very top of Osborns hill, are said to be taking out pay rock at every step of their prospecting, making their own as well as the adjoining ground upon which they enter theirs every day more valuable.

PLACER.

HARD CEMENT.—Dutch Flat *Forum*, Aug. 22: We had an interview with the superintendent of the Green Valley mine, last Sunday, who states that the cement in the shaft is so hard that but little progress can be made, and that he considers it would be good policy to abandon it and put down another shaft about 250 feet higher up the river. He will go to San Francisco in a few days to consult the company in relation to such a movement.

GREEN VALLEY MINES.—We are indebted to R. Huysinck for news from the G. V. B. G. M. Co. The company hevs at last found bedrock in their shaft at the depth of 50 feet, which makes this distance from the surface about 100 feet. The last 12 feet was found to be a hard blue cement. The pump is run by a hurdy wheel, which also furnishes power to run a four-stamp mill to crush the cement. Work has not as yet progressed far enough in the shaft to admit more than one man working on a shift, but as soon as an opening is made they will increase the number and drift to both sides of the channel. The tunnel which is run to the back channel is now in 150 feet. The gravel is a hard blue cement and the indications are encouraging. The mine is now in the very best condition to prospect thoroughly and to good advantage, and the superintendent is pushing matters as fast as possible. It is to be hoped that this great mining enterprise will prove a success.

MINING ITEMS.—The Polar Star claim continues washing. The pipe leading to the Southern Cross claim is being put in place as fast as made. The Lakamp claim continues washing a few hours each day. The Franklin is also washing a few hours each day and clearing off the bedrock, preparatory to putting up and rigging a first-class water power derrick this fall. The Yankee tunnel is still being driven ahead vigorously. Last week there were eight face shots fired, advancing 36 feet. The Baker shaft is still going down. It was sunk 12 feet last week. At Gold Run, the Indiana Hill, Sachs and Cedar claims continue washing.

AT LITTLE YORK we visited the Empire Hill claim one of the finest and best paying hydraulic mines in that district. Here they are provided with a nice new derrick, capable of lifting a rock that weighs eight tons with apparently as much ease as a boy would handle a ball. It is a very great labor saving institution, and works like a charm. They are now using 1,200 inches of water, and under the personal direction of Tom Bailey, the foreman, sad havoc is being made with the rich gravel bank against which they are piping. The water of the company is abundant to run the Empire Hill and the Liberty Hill claims, alternately, until the rainy season sets in.

MORE CHROME.—Placer *Herald*, Aug. 26: Some time ago a ledge of chrome iron was discovered near Auburn, and parties from the chrome reduction works at Baltimore were attracted here, and forthwith contracted, at a remunerative price, for every ton the mine might produce. Unfortunately, however, the ledge pinched out, and thus terminated, rather abruptly, what at first promised to be an important enterprise. A few months ago, while we were on the Forest Hill divide, our attention was attracted to some croppings of heavy, dark, fine grained ore, out on a hillside among the tall pines, not far from the Suger Pine mill, and about eight miles from Forest Hill. From the specimens of chrome we had seen we judged this to be the same, though not being an expert, we dared not press our opinion. We now learn that this lead has been more thoroughly prospected, and that it proves to be a superior quality of chrome iron, and very extensive. Its distance from the railroad may prevent it from being worked remuneratively at present, and yet, where, like in this deposit, there is known wealth, the ingenuity of man will not be long in overcoming the obstacles necessary to acquire it.

SANTA CRUZ.

ROH COAL DEPOSIT.—Santa Cruz *Courier*, August 25: For a long time Mr. Strader, of the firm of Strader & Co., has been prospecting in the hills above Coralitos, feeling certain that the prospects he had seen from there and the indications of the ledges in that vicinity were sure signs of coal deposits. After two years of hard work and an expenditure of $65,000, this gentleman feels confident that he has developed a mine that will largely pay him for his trouble, and furnish a better quality of coal than does any other mine west of the Sierra Nevada mountains. A *Courier* reporter last week visited Mr. Strader, and by him was informed of the principal points concerning the discovery: It is termed the Vulcan mine, and is situated about three miles north of Coralitos, on Coralitos creek, and is owned and worked by the Vulcan coal mining company. It has four well defined veins, each of which can be traced two miles, and are located thus; the first, which is right on a level with the water bed, is 100 feet below the second; the second, 400 feet below the third, and the third 700 feet below the fourth. They have a shaft sunk on one of them 160 feet deep, from the bottom of which an 85-foot drift has been run in towards the lower veins. The depth of eighty-five feet this vein was nine feet in width, and of an improved quality from what it was above. This coal resembles anthracite, and is perfectly free from sulphur. It can be mined much more cheaply than can the Diablo coal, because this company has plenty of good timber right on the spot, whereas the first named company has to ship it from a distance. It is calculated that it will cost only $3 per ton to deliver the Vulcan coal at tidewater, and $1.50 per ton to freight it from there to San Francisco. Thirty sacks of this coal were recently shipped to Savage & Son, San Francisco, who smelted iron with it by way of giving it a test. It has the appearance of "Scotch Flint," which it pays to ship across the ocean. The Vulcan company has already had a number of bids from various quarters for the purchase of this mine.

SONOMA.

SANTA ROSA COAL.—Sonoma *Democrat*, August 25: The Taylor Mountain coal mining company of Santa Rosa was incorporated a few days since. The shaft of the mine is down 92 feet and a tunnel is now being run to tap the vein 260 feet vertically from the top of this shaft. The tunnel is in about 100 feet and has cut a small vein of coal from two to four feet. The vein matter at the bottom of the shaft is about ten feet, with a hard coal vein of from two to four feet. We saw a sample of the coal Saturday morning, taken from the bottom of the shaft. The piece shown us weighs about 40 pounds and in quality is very fine—surpassing any coal heretofore found on this coast. The prospects of this mine are every way prosperous and encouraging, and the advantages to Santa Rosa from its development, if it proves as it now promises are incalculable.

PINE FLAT.—Russian River *Flag*, August 24: The Oakland mining company have added another condenser to their furnace, and are working right along on an apparently exhaustless supply of very rich ore. Much of the cinnabar is so rich that not a particle of foreign substance can be seen in it. Their furnace has capacity for only six tons per day, and yet 300 flasks of mercury per month are turned out. There are only 18 miners employed. The mine is still under the management of Wm. A. Dennis, one of the most competent superintendents that has ever been in this district.

The Bacon has put in steam hoisting works; they employ 20 men, who are sinking a shaft toward the ledge. Last week, at the depth of 280 feet, a body of very rich ore was tapped, but its extent is not known. The mine is owned by English capitalists, who will make a big affair of it if a paying lead is struck.

The Kentuck is working ten men, taking out good metal, which they will reduce in the Geyser furnace.

TRINITY.

PAID WELL.—Trinity *Journal*, Aug. 24: From Mr. C. M. Mead, of Minersville, we learn that the claim owned and worked by himself and Nathan Wheeler, on Mosquito gulch, paid exceedingly well the past season. Several nuggets of over $20 each were picked up during the season, and one piece of $61. Mr. Mead tells us that ore another winter sets in they will have the claim in the best possible working order, as they intend fitting up with a little giant iron pipe, and other improved machinery.

CINNABAR DISTRICT.—From Mr. S. J. Dickinson, who left Cinnabar recently, we learn that the low price of quicksilver has had a depressing effect on prospecting in that section. Only about 50 men were at work in this district. The retorts at the Altoona were running on concentrated ore and producing about 12 flasks a day.

TUOLUMNE.

CONFIDENCE MINE.—This, properly speaking, is the deepest mine in this county, having attained at the present time a depth of 800 feet from the surface. This main shaft is run on an incline of 25 deg. In descending at a depth of 225 feet from the surface you encounter level No. 1, which has been opened a distance of 500 feet. The vein here having been extracted we could only judge its width from wall to wall. In some places appearances indicated the width to be from three to 30 feet. Proceeding downward at a depth of 250 feet we encounter level No. 2, which is 400 feet in length, with the same large and prosperous looking ledge. At a depth of 350 feet is situated level No. 3, 300 feet in length. No 4, 425 feet from the surface, is 600 feet in length, and No. 5 is at present 1,400 feet. No. 6, and last, is 800 feet, the present depth of their workings, and driven a distance of 600 feet along the ledge, showing a regular and well defined vein of quartz, measuring full four feet in thickness. The work on the above at the time of our visit was temporarily suspended on account of the incapacity of the pump to lift the fast accumulating waters. However, we were informed that in a few days a new and larger pipe would take the place of the present one, enabling them to prosecute their labor as heretofore. In connection with this mine the company are the possessors of a large 20-stamp mill, propelled by a 60-horse power engine, their average reduction of ores being nearly equal to 20 tons daily. They also have two arastras kept steadily running recrushing the pulverized matter escaping from the batteries. The ores being of that class commonly known as free gold, with little or no sulphurets, making it, no doubt, a great deal easier and of less cost for reduction.

WASHOE DISTRICT.

BULLION.—Gold Hill *News*, Aug. 24: New life and vigor is being infused in every quarter of the mine. The obtaining of a good air ventilation on the lower levels has enabled the commencement of the opening of the mine in a thorough manner that it was impossible to do without it. On the 1400-ft level the north drift is again being pushed rapidly ahead in an entirely unprospected portion of the mine. In the connecting winzes between the 1400 and 1700-ft levels, the enlargement and connection of the two is about finished. The 1550-ft station is also completed, ready to start a drift and cross-cut the ore vein at that point. The north drift on the 1700-ft level is again started up and is being run into an entirely new section of the vein and mine. It penetrates the ledge 1850 feet below the surface, and is rightfully regarded as one of the most important points on the Comstock. On the 2000-ft level the drift running into the Alpha ground has been thoroughly cleared up and repaired, new air pipes put in and other dead work completed, so that but little progress has been made in the face of the drift. Last evening, however, the repairs were finished and the advance commenced in good earnest. The prospects are that if the Bullion and Alpha are paying mines we shall soon know it.

JUSTICE.—Daily yield, 110 tons of ore, keeping the mills steadily runoinz. The quality of the ore is good and a much greater quantity could be extracted if the management so desired. The 800-ft level has every prospect of opening up much finer and more extensive bodies of ore than has yet been developed in any portion of the mine.

IMPERIAL CON.—Daily yield, 30 tons of ore, keeping the mill steadily running. The ore breasts are looking well, and it is confidently expected that the extraction of ore can be greatly increased in a very short time.

MELBOURNE.—This mine is one of the eastern group of new mines just being opened on the main east range of the great Comstock ore belt. It is located in Gold Hill mining district, east of the town of Gold Hill, and about 2,500 feet south of the Con. Virginia and California mines. It is in the immediate vicinity and forms one of the same group which is included in the Occidental Jull's, Prospect and Europa mines.

JULIA.—A new survey has been made, and the course of the main south drift on the 1600-ft level has been pointed directly for the Ward shaft, for the purpose of making an air connection with that mine. The running of the drift in this course will carry it east of the ledge. It is the intention to cross-cut the ore vein at distances of 100 feet as the main drift advances. The east drift on the 1800-ft level, after penetrating 45 feet of porphyry entered a soft, fine-appearing body of ledge material, through which it penetrated a distance of 40 feet more, when last evening a heavy, smooth clay slip was cut, and the entire face of the drift passed into a splendid body of solid, clean-appearing quartz and ore. The extent of this new discovery, of course, is not yet known, although there is no doubt that it is a continuation of the ore found on the east side of the shaft at the 1700-ft station.

CALIFORNIA.—Daily yield, 700 tons of ore. The ore breasts on both the 1500 and 1600-ft levels are yielding rich ore, and have as fine and permanent an appearance as it is possible for a mine to possess. The yield of bullion for August up to the present time is considerably greater than it was at the same date in July, and the yield of the mine will not fall much if any short of $2,500,000 for August. On the 1600-ft level it has been found necessary to temporarily suspend work in the face until the drift can be retimbered. The face of this drift is still in rich ore. The ore in east cross-cut No. 2, on the 1400-ft level, continues to show better and better as the drift advances. The shaft is now down 83 feet below the 1500-ft level. The new 60-stamp mill is about ready to set to work. The mills are all kept running up to their full working capacities.

CON. VIRGINIA.—The shaft has been completed to the 1550-ft level, at which point a large and convenient working station is being opened. The extraction of ore will be lighter this month than it was last, owing to a cave in the Gould & Curry shaft, which has suspended the extraction of ore until such time as the shaft shall be again in good working order. The mine is looking well at all points, and is being put in the

finest possible working condition, so that when the shaft shall be finished and the new mill shall be ready to run, a lively run may be looked for, and the mine again be placed in the front rank of the bullion producing mines of the world. The new amalgamating mill is fast approaching completion, nearly all the machinery being in place, ready for use.

OVERMAN.—The pit, 34 feet in depth, for the immense stone foundation of the new and powerful pumping engine is almost completed. The large reservoir east of the shaft for the use of the condensing engines is completed and is being filled with water drawn from the shaft while sinking.

SIERRA NEVADA.—The 1700-ft station is completed and a drift started to cut and prospect the ore vein at that point. A large and powerful blower is being erected to furnish air for the 1700-ft level when it is opened.

CROLLAR-POTOSI.—Daily yield, 100 tons of ore, which is being milled as fast as it is extracted. This ore is taken from the old Santa Fee and Potosi workings, and has an assay value of about $32 per ton. The new and powerful pumping engine will soon be completed, ready to start up.

UTAH.—The shaft is now down 465 feet below the 400-ft level, or 866 feet below the surface. The flow of water has been caught up in the side tanks, so that the shaft is almost dry, and the sinking is carried forward much more expeditiously than for some time past.

GOULD & CURRY.—The heavy slide in the shaft has been caught up and the shaft repaired. Sinking the joint winze below the 1600-ft level on the Savage line is making good progress.

WARD.—Sinking the shaft is going ahead six feet per day. This is just about the liveliest sinking that has ever been done on the Comstock.

BROWN PONT.—The north drift on the 1700-ft level is steadily advancing to connect with south drift from the 1940-ft level of the Yellow Jacket mine for ventilation purposes.

NORTH CON. VIRGINIA.—The new pumping engine is in place, and the erection of the pumping machinery is rapidly approaching completion. Everything is in readiness to place the pumps and coinmns in the shaft; the drain tunnel is finished and it will not take long to have everything in readiness to extract the water and resume sinking the shaft.

ORIGINAL COMSTOCK.—A reorganization of the company having been lately made, work is to be resumed upon the mine without delay. A body of quartz was struck in the shaft a short time ago similar in character to that found a few years ago, which produced $6,000 in gold from the ore taken out within 35 feet of the surface.

LADY WASHINGTON.—The bottom of the shaft is still in quartz of the same solid and favorable character heretofore described.

SILVER HILL.—The main incline has reached a vertical depth of 650 feet, at which point a station is being opened for the purpose of cross-cutting and prospecting the ore vein.

NIAGARA.—Sinking the main incline is going rapidly forward at a rapid rate of speed.

LEVIATHAN.—The north drift on the 600-ft level is making the usual good progress, the face in quartz mixed with clay and occasional spots of ore.

BEST & BELCHER.—Owing to the cave in the Gould & Curry shaft last week, but little work has been done in the mine since our last report.

DAYTON.—A force of men have been put to work to cross-cut and develop the 350 feet of ledge laid bare by the south drift on the 300-ft level. In a day or two more men will also be set to work to cross-cut and open the mine on the 600-ft level, where there is nearly 1,000 feet of the ledge in a manner stripped ready to open up. A splendid new and powerful air compressor is being placed, ready to furnish air when necessary, for the use of the prospectors on the lower levels.

OPHIR.—Daily yield, 300 tons of ore, keeping the mills crushing up to their full working capacities. The ore bresste on the 1600-ft level continue to open out finely, and afford a fine yield of good ore. The north drift on the 1600-ft level is steadily advancing toward the Mexican line. The main drifts and cross-cuts on the 1700-ft level are being cleaned out and repaired, preparatory to driving still further east to find a continuation of the east body of ore recently struck on the 1600 and 1650-ft levels.

YELLOW JACKET.—The south drift from the bottom of the winze on the 2040-ft level is in a distance of 55 feet. At a distance of 60 feet from the winze a cross-cut east has been started to cut the ledge. The faces of both the drift and cross-cut are in a very favorable ledge formation. The main south drift on the 1740-ft level has been reopened.

AMAZON & GLASGOW.—The Combination shaft is down 385 feet—86 feet below the third station level. The bottom of the shaft cut the clay wall of the ore vein yesterday afternoon, which is well defined and shows well. Some lively developments are looked for in a very few days. The ore developments on the third level were of a fine description, much of the ore being of a good quality.

BELCHER.—The erection of the new pumping machinery and the placing of the pumps in the shaft is being pushed to completion with all the rapidity that the perfection of the work will admit of. Daily yield of ore 250 tons.

SAVAGE.—The new pumping engine is in complete working order. Steam has been turned on and everything found to operate in the smoothest and best possible manner.

BUCKEYE.—A cross-cut has been made from the main south drift on the 650-ft level at a point 150 feet south of the main shaft. The ledge at that point is solid quartz and low grade ore and is well defined.

HALE & NORCROSS.—The pumps and columns are in place to the surface, ready to complete the connections with the big pumping engine.

CALOTTA.—The new engine is up and runs as smoothly and nicely as it is possible for machinery to do. Yesterday the diamond drill was set to work and all nightfall was boring into the earth's crust at a lively rate.

WEST BELCHER.—The extraction of ore has been commenced from the west upraise on the 300-ft level. The ore is of good quality, the assays averaging $80 per ton.

ROCK ISLAND.—A strong flow of water was struck in the main south drift on the 850-ft level last Tuesday morning, which has delayed the work on that level and kept the pumps working at their topmost speed ever since.

MEXICAN.—The main north drift on the 1466-ft level is steadily advancing, the face in favorable ledge matter. The northwest cross-cut near the south line is rapidly advancing, the face still in ore.

LADY BRYAN.—The old buildings have been removed, a new reservoir built, and other preparations made for the rapid progress of the work as soon as the new machinery arrives.

HERALD.—The incline shaft is down 95 feet, the ledge constantly getting larger, and the ore improving in richness.

SUCCOR.—The masons are busy laying the heavy stone foundations for the new pumping engine and machinery.

TROJAN.—Sinking the shaft has been resumed in order to open on the ore vein at a greater depth.

COSMOPOLITAN.—The ore body in the upraise from the tunnel level is showing well. The ore in the south drift on the tunnel level is also opening up quite favorably.

PROSPECT.—The station is completed at the 400-ft level and the diamond drills have been started to penetrate the ledge at that point.

SOUTH END.—Sinking the shaft is being pushed with great vigor. Three shifts of men are employed. The hoisting machinery works finely.

(Continued on Page 164.)

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

M. Opal, Hydrophane, Cacholong, Hyalite, Girasol.

The only variety of this mineral of value as a gem is the precious or fire opal.

The precious opal shows a rich play of colors.

Fire opal presents light red and yellow reflections.

Hydrophane is opaque, but becomes transparent when placed in water, from which property it takes its name.

Sir David Brewster has said that the fire opal owes its peculiar color to numerous pores or fissures which decompose the light.

The composition of the opal is silica in the soluble state, and water, but some varieties are nearly anhydrous. A specimen of fire opal from Mexico, on analysis was found to consist of: Silica, 92; water, 7.75; sesquioxides of iron, .25; total 100.00

Its hardness is 5.5—6.5. Specific gravity, 1.9—2.3. Luster, vitreous, inclining to resinous, sometimes pearly. Color, white, yellow, red, brown and green. Streak, white, often showing rich play of colors by reflected light. B. B. infusible, but gives off water and becomes white.

Decrepitates and falls into splinters; dissolves in borax bead. Opal in all its variaties may be distinguished from other forms of silica by being nearly all soluble in boiling solution of caustic soda or potash.

Opal scratches glass slightly, is scratched by quartz.

Silicified wood, abundant in several counties in California, is a variety of opal, and is sometimes called opalized wood, or semi-opal.

Hyalita or Muller's glass, is a transparent variety of opal, which occurs in rounded masses coating other minerals.

Girasol is bluish white with reddish reflections.

Precious opal is sometimes called "oriental opal."

The opal was well known to the ancients as "opalus," from which the modern name opal is derived. Pliny writes of a Senator, Nonius, who owned an opal valued at two million of sesterces. Nonius was proscribed by Antonius, who wished to possess himself of the ring in which the opal was set. Rather than to part with it Nonius fled, taking nothing with him but the opal ring.

Good opals command a high price. A fine specimen, but not large, was sold in Paris for 2,400 francs, and another of fine color and rather large size was sold for 300,000 florins.

Opals command prices ranging from $4 to $10 per carat, pieces suitable for rings from $2 to $20 per carat.

A magnificent Hungarian opal at the London exhibition weighed 526½ carats, and was valued at £4,000 sterling.

Opal occurs in veins of porphyry, also in amygdaloid cavities, sometimes in limestone. Precious opal is found in Hungary and at Gracias a Dios, in Honduras. The opal occurs at Zimapan, in Mexico.

Hyalite is common on the plains in San Bernardino county, Cal., and at a locality 30 miles south of Mt. Diablo.

Common opal occurs in a peculiar formation at Mokelumne Hill, at Stockton hill, in Chile gulch, in Mt. Diablo range, 35 miles south of the mountain, also at Four Creeks, Tulare county, and in many localities in other parts of the world.

Opalized wood is found in Nevada county in many beautiful varieties. It is often washed out of the hydraulic mining claims.

There is a peculiar charm about the opal which makes it a great favorite with many people of taste and refinement. Some allow their preference to become a sort of monomania which leads them to pay very high prices for a favorite stone. This is much more common in the old countries than in America. Any person who sees a fine fire or precious opal of rare color set in a circle of diamonds can readily understand the feeling which prompts them.

Oppressive Figures.

"Our city; cost of its ruin," was the title of an outspoken temperance lecture delivered by Rev. A. S. Fiske, at the Presbyterian church on Howard street, last Sunday evening. There is no need, he premised, to enter into any elaborate discussion of the constitution of this thing that destroys, nor of the history of its development and use. Suffice it to say that alcohol is a thing evolved out of a rotten substance. It is the terrible essence of decay; it is the very living spirit of the putrid. Science has shown that it is neither food nor fuel. It is simply an irritant, and this was its effect from its first titillation to its last agony in delirium tremens. It is a lying spirit. Its distilleries can be honestly gauged by no government under Heaven, nor its treacherous drug fairly meted out by any measure yet invented of man, nor its taxes honestly paid under any system of revenue. The worm of the still is crooked in the grain and cannot be made straight, and it is a worm that dieth not, that gnaweth ever. There are no fewer than 2,300 places for the retail sale of intoxicants in this city. No man would venture to estimate the average earnings of such places throughout the country at less than $10 a day, giving an average of about $5 profit. The receipts in San Francisco would need to be much larger than this; for ours is a costly town and the rents are high, and living is good and all things are done with a wide, open hand, and we are nothing if we are not large in our vices. We do not mean to be stingy—we disdain to set the support of our drinking houses at a lower figure than that of the average through the country towns—than that of the narrow, puritanic, penny-saving East, as we are pleased to call it. But take the receipts at $10 a day. This gives an average of $23,000 spent daily among the 2,300 retail drinking places of the city. For a week the amount was $161,000, a good round sum. At thirty days, it gave $690,000 per month. Why, the figures are getting oppressive. Well, then, the figures are oppressive—not in a sermon only, but in a city; and they oppress not the imagination alone, but life everywhere. For the year the sum was $8,400,000. We spent money enough in twelve months for drink to carry on our common schools for ten years without having to pay our teachers warrants that had to be discounted. We squandered enough in one year to pay twice the sum of all our taxes. But the figures told the sad story in another way. 2,300 saloons among a population of 250,000 gave one to every 113 persons of both sexes and all ages. Out of the ranks of this 113 must be counted the children, the women and the untainted—a full three-fourths. That leaves 28 persons for the maintenance of each dramshop. What an appalling taxation these men have to bear! If Christians would tax themselves in the same ratio the redemption of the world would be speedily wrought. It is impossible even in the rich and powerful and devoted Presbyterian church to get for all Christian objects together so much as ten cents each a day. Consider the devotion of these 28 men to their drunken god. Get rid of this traffic and three-fourths of our police might be dismissed; many of our courts might be abolished, our prisons would be mainly emptied, our poor houses would be thinly peopled, our list of shameful and appalling crimes would be shortened, murders would be rare occurrences, a suicide would be a seven-day's wonder, and our security, honor and good name would be re-established in a day. We are exhibiting at this season the products of our industry; among them he noticed the products of the liquor traffic—no, not that exactly. The products of the traffic were outside—in the gutter, in blasted homes, in the drunkard's grave. "Is not the cost of the traffic in this city," he asked, in conclusion, "too intolerably heavy for the human mind to weigh, for the human heart to endure; and when its cost gets home upon your sons and your daughters and into the circles of your home, it will be heavy enough to break your heart as it has broken the hearts of ten times ten thousand in our land before."—*Call.*

Tulloch's Ore Feeder.

These machines save all hand labor in feeding the battery, and perfect control is had over the feed. By actual test the increase in ore crushed when fed by this device, instead of by hand, is said to have been two and a half tons to each five-stamp battery in 24 hours. They will save more gold than by hand feeding, owing to the regular, steady feeding and overflow of pulp over the plates, with no scouring of plates or loss of amalgam. The bulk of the gold is amalgamated in the battery. The Tulloch machine is so constructed that the drop of the stamps feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it is more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be wet or dry. Mining experts and millmen endorse this machine highly. Mr. F. Ogden, 417 Market street, sole agent, will give further information if desired. This machine is now in use at the following mills: Consolidated Virginia, California, Trench, Douglas (Gold Hill), Northern Belle, Leopard, Homholdt, Eagle, Columbus, Duncan, Gold Mountain (Amador), Central America, Buchanan, Green Mountain, Santa Rita, Tiffany and Hepburn, Guaymas, Sumner, Sunrise, Riverside, Shawmnt, Knox & Boyd, Spring Gulch, Thomas Evans, Magruder, Leonard, Douglas (Mariposa), Hite, Phœnix, Banderita, Crescent, Barranca, Emigrant, Church Union, etc.

THE TRANSPLANTATION AND IMPLANTATION OF HAIRS.—An interesting paper on this subject appears in the *Zeitschrift fur Biologie*, from the pen of Dr. Ernest Schweninger, of Munich. He gives the following as the result of his numerous experiments: First, that the hairs that have been recently extracted, and to the root of which cell-layers of the root-sheath still remain adherent, if brought in contact with freshly granulating surface, are capable of contracting adhesions with this, and from this point a process of skinning over may commence, as after cutaneous transplantation. He has further shown that such hair root-sheaths can attach themselves to the iris and continue to grow. The iris, therefore, constitutes an excellent place for conducting experimental researches of this nature.—*Lancet.*

Wire Work.

The collection of useful and ornamental articles embraced under the head of wire works, can hardly be enumerated or realized, except we are placed directly in contact with them, and then we are astonished at their number and variety. Mr. A. S. Hallidie, president of the Institute, makes a fine showing of California industry in this line of goods. His display is unique, varied, tasty and multifarous, and demonstrates the usefulness of this class of manufactures.

Among the many articles we will enumerate round, flat, and oval wire rope of all sizes; brass, copper, and steel wire; silver plated wire; wire cloth and netting of many grades and widths; wire of all kinds for use of the different trades; garden trellises, summer houses, rustic chairs and seats, bird cages of innumerable patterns, fire screens, fly screens, and some pretty window screens, colored and ornamented with rustic views. These latter are very nice for kitchen and storeroom windows, being so close woven that a flea would have to tone down some to get through. But, perhaps, what is more interesting to many than all these, he exhibits in full operation the veritable old loom of our grandmother's, actually

Weaving Wire.

By the same old treadle and shuttle throwing process that they used when manufacturing "linsey woolsey" frocking, and "300-linen." This is quite a treat, and something old that to many visitors is entirely new. The children especially ought to thank Mr. Hallidie for this one thing, if for nothing more. There are also many articles of table use in his exhibit, such as castors, fruit baskets and the like, manufactured of white metal wire, that are very tasty, unique, and attractive.

The universal consumption of wire goods in the last few years has greatly stimulated the inventive genius of manufacturers, and wire is now used for a hundred and one purposes that twenty years ago were unthought of, and we believe the next ten years will see still more progress in that direction. We think that a cheap and useful article would be an arch for grape trellises that could be placed upon wood posts, the arches having loops through which wire could be stretched longitudinally for the support of the vines. This would be convenient for use in country residences, where wood posts would be cheaper than wire or iron, and the wire arches neater and better than wooden ones.

Mr. Hallidie has succeeded to the business of J. M. Eckfeldt & Co., and has united it with his own under the name of the California Wire Works, and now has his office and salesroom at 412 Clay street.—*Mechanics' Fair Daily.*

Hawkins & Cantrell's Steam Hoisting Engine.

The two large upright hoisting engines at the lower end of the machinery department of the fair are from the shop of Hawkins & Cantrell, 210 Beale street, and are good samples of the style of hoisting of which they have made a specialty for several years. Their engines were made for mining and wharf purposes or for any place where it is necessary to do hoisting. The engines are made heavier and stronger than those of Eastern manufacture, it being necessary in mining work to have them of the strongest and most durable character. The large double engines are made with locomotive boilers and intended to hoist from a depth of 1,000 feet. The smaller ones with single engine and reel have vertical engines. One of the engines exhibited is a 20-horse power one and weighs about 7,500 pounds. The smaller is a 10-horse power engine.

A number of the largest size of this class of engines are in use on the Comstock for prospecting purposes and in several cases are used for regular mining work at considerable depth. As a usual thing, however, engines of this kind are mainly used for prospecting purposes before large and heavy hoisting works are built. They are made with a heavy iron frame and so arranged that an engine, boiler, etc., can be shipped as one piece and set to work in an hour after arriving at the mine. It only needs a few timbers upon which to bolt the frame and it is all ready. Being much less expensive than heavy large hoisting engines, these are in demand for opening mines.

The largest size engines made of this class by Hawkins & Cantrell are double hoisting engines with link motion and double reel; one of 40-horse power only occupies a space of 20x14 feet; one of its advantages is that the engineer can control the brakes and the hoisting from two separate shafts and run his engine at one and the same time. The convenience of this arrangement can easily be seen by mining men.

The engine which is more especially intended for small mines is so simple that it requires no skilled labor to set it up, as the boiler and engine are both within one frame. An engine of this kind can, for five years at least from the opening of the mine, keep a 20-stamp mill at work at an expense much less than any other pattern. Messrs. Hawkins & Cantrell do a general machine shop business, but make a specialty of the engines we have described.

The Hawaiian Treaty.

As briefly noted in last week's Press, the treaty of reciprocal trade with the Sandwich islands has received the approval of the Washington government. The effect of the treaty upon the trade and industry of our State cannot be clearly marked out. It is the opinion of some of our leading merchants that it will not materially affect the price of articles of merchandise which may be imported under its provisions, but a profitable trade is looked for in the articles which we may export. This export trade to the islands does not amount to very much at present, the gross value of our exports to Honolulu being but about $350,000 since the beginning of the year. The treaty gives us free entry to the islands for almost every article of merchandise, produced or manufactured in this country. This will give us an advantage over other countries in all these lines of trade, and the value of the treaty in this respect will of course depend upon the capacity of the islands to use our productions and our enterprise in promoting the consumption of them among the people of the kingdom.

While the treaty gives almost *carte blanche* in respect to the merchandise which we shall send to the islands, it gives the islanders free trade in our ports for the following articles: Arrow root, castor oil, bananas, nuts, vegetables dried and undried, preserved and unpreserved; hides and skins, undressed; rice, pulu, plants, shrubs or trees; muscovado, brown and all other unrefined sugar, meaning thereby the grades of sugar heretofore commonly imported from the Hawaiian islands, and now known in the markets of San Francisco and Portland as "Sandwich island sugar," syrups of sugar-cane, melado and molasses; tallow.

As may be seen, the leading article above is raw sugar. This is the most important product of the islands and upon this article all the opposition to the treaty has been based. In the Southern States, especially in Louisiana, the opposition has been very marked because it is feared that the treaty will depress the price of cane products there. Whether our consumers will reap a benefit in low prices for sugar is not yet certain. The raw product will reach our refiners at a lower rate, but we do not expect to see a commensurate reduction in refiners' prices unless there should be more competition in the business than now exists.

By the terms of the treaty the reciprocity between the two Governments is to continue for seven years or longer. At any time after seven years the treaty may be abrogated by either party giving the other one year's notice. Thus it appears that we are booked for the experiment, and we can but hope that all benefits which its promoters have anticipated may be realized by both nations.

Land Law Decisions.

A dispatch from Washington, dated August 17th, is as follows:

Secretary Chandler has finally determined what his decision will be in respect to the selections of indemnity school lands in California. The points of the decision, which will be rendered to-morrow, are as follows: The department will insist upon the ruling made in the Selby case, as far as it affects selections made subsequent to its date and hereafter, which determines that no selections of indemnity lands will be valid unless made after final approval of surveys within which the State is entitled to indemnity; but in respect to selections made prior to the decision in the Selby case, the department will hold, first, that preemption and homestead settlements made in good faith upon lands selected by the State prior to such selections shall be protected, and entries made subsequent to such selections shall not be respected. Second, all selections made by the State after surveys by the surveyor-general shall be confirmed, unless subsequent surveys shall show that the lands for which such indemnity is claimed are still the property of the State; in which case the State may substitute lands, and return the selections made prior to the Selby decision. This practically confirms the title of all purchases from the State.

The following decisions by the Commissioner of the General Land Office are taken from *Copp's Land Owner*, for August:

Lode claims in Montana, located under the Territorial Act of December 26th, 1854, are entitled to 50 feet in width of surface ground on each side of the lode in addition of the width of the lode.

The portion of a mining claim sold to an alien cannot be patented while such owner is an alien, but on his declaration to become a citizen his right dates back to the purchase, and he may thereupon secure a United States patent for his claim.

Regular army officers, who served during the rebellion, may initiate homestead entry while in the army, but on making final proof must show at least one year's residence on the land entered, if they served four years during the late war.

Prairie lands, or lands not prairie but naturally devoid of timber, are subject to the operation of timber culture laws. Where a party applies to enter under the timber culture laws, land which appears on the township plot as already timbered, and is informed that he must disprove such apparent character, his application reserves the mentioned tract for a reasonable time from future disposition to any other claimant.

Useful Information.

How to Make an Emery Wheel.

Joshua Rose writing for the supplement of the *Scientific American* gives the manner of putting the emery and fastening it upon the wheel, as follows: The face of the wheel is well supplied with hot glue of the best quality, and some roll the wheel in the emery. The emery does not adhere so well to the leather as it does when the operation is performed as follows: Let the wheel either remain in its place upon the shaft, or else rest it upon a round mandril, so that the wheel can revolve upon the same. Then apply the hot glue to about a foot of the circumference of the wheel, and cover it as quickly as possible with the emery. Then take a piece of board about three-fourths of an inch thick and 28 inches long, the width being somewhat greater than that of the polishing wheel, and placing the flat face of the board upon the circumferential surface of the wheel, work it by hand, and under as much pressure as possible, back and forth, so that each end will alternately approach the circumference of the wheel. By adopting this method the whole pressure placed upon the board is brought to bear upon a small area of the emery and leather, and the two hold much more firmly together. The speed at which such wheels are used is about 7,000 feet per minute. The finest of emery applied upon such wheels is used for cast-iron, wrought iron and steel, to give to the work a good ordinary machine finish; but if a high polish or glaze is required, the wheels are coated with flour emery, and the wheel is made into a glaze wheel by wearing the emery down until it gets glazed, applying occasionally a little grease to the surface of the wheel. Another kind of glaze wheel is made by covering the wooden wheel with a band of lead instead of a band of leather, and then applying to the lead surface a mixture of rouge, crocus and wax, worn smooth by applying to it a piece of sheet steel, or a piece of flint-stone before applying the work. Others add to this composition a little Vienna lime. For flat surfaces, or those requiring to have the corners or edges kept sharp, it is imperative that such wheels as above described—that is to say, those having an unyielding surface—be used; but where such a consideration does not exist, brush and rag wheels may be used. In Europe comparatively large flat surfaces requiring a high polish are finished upon wooden wheels made of soft wood and unemeried, the polishing material employed being Vienna lime. The lime for ordinary use is mixed with water, and is applied by an assistant on the opposite side of the wheel to the operator. For superfine surfaces the Vienna lime is mixed with alcohol, which increases its efficiency; and here it may be as well to note that Vienna lime rapidly deteriorates from exposure to the air, so that it should be kept as little exposed as possible.

Straightening A Heavy Shaft.—J. J. Hill, of Hayden's Ferry, Arizona, writes as follows to an Eastern exchange: The following is a good way to straighten shafts that have been sprung by heat or otherwise. Lay the shaft on bearings at each end, with the arched side up, about one foot from the ground; then build a fire (wood will answer) under the part or parts to be straightened. When hot chill the top side, which is to be straightened, with water, which can be best done with a swab; continue the heating and chilling till the work is complete. Allow the heat to come back to the top side between each chilling, to quicken the process, and to ascertain when complete. After the shaft is hot, a very little fire will be required to continue the heat. I think that any kind or size of metal shafting can be straightened by this process. I made the experiment on a wrought iron shaft five inches in diameter and 12 feet long, that was sprung three inches by being burnt in a mill. It was only two hours from the time I built the fire under it till it was perfectly straight.

English Trade Marks.—The *Ironmonger* is informed that the English Commissioners of Patents have come to a decision of some interest as regards new trade marks—namely, that a crown or any royal symbol, or the name of a town, or the word "best," to denote quality, cannot be allowed as a trade mark, if adopted since the passing of the trade marks act, 1875. This exclusive regulation is an extension of those previously announced, which declare that the following devices, designs or words will not be registered as new marks or parts of new marks—namely, representations of the queen, or any member of the royal family, or of foreign sovereigns, royal or national arms, crests or mottoes, arms of counties, cities, boroughs and families, prize or exhibition medals, or the words, trade mark, patent, warranted, or guaranteed. To these exclusions, as above stated, are now added royal symbols, the names of towns and the word "best."

Files.—A new file should always be used with a light pressure on the work till the needle like points of the teeth are worn away. After this, a heavier pressure may be used with much less danger of breaking of the teeth at their base. Many new files are violently diminished of half their efficiency by a few careless strokes when first applied to the work.

Influence of Climate on Indian Corn.

In his review of the botanical features of the Centennial, Thomas Meehan writes: An interesting fact has been brought out by Professor Miles, of the Illinois industrial university, in regard to Indian corn. He was anxious to find out the most popular varieties in certain States; and he has the varieties arranged according to geographical popularity just as they run. Those acquainted with the morphology of an ear of corn know that the male (tassel) and the female (ear) are both structurally on the same plan. In the flint corn, the kinds most popular North, the tassel is composed of eight leading branchlets, along which the male flowers are arranged. To form a female spike, these eight are drawn upward, fasten themselves together by the husks, and by this union gain comparatively increased succulence; and what would be male flowers when separate become female united, and the result is an eight rowed ear of corn. In the Southern forms the branchlets of the panicle fork; and so when drawn up to form an ear, we have double the number—10, 12, but generally 16 rowed ears. Now the eight rowed corn is found most profitable from Canada to the southern part of New York State; after that the 16 rowed comes into favor. By studying Professor Miles' collection we learn for the first time why this is. In the north the grain is very large in proportion to the size of the cob; but as it gets south the cob thickens, at the expense of the grain. Why there should be this inverse influence is not clear; but the fact is evident; and it is one of the most interesting instances of the operations of climate on changing form that I have met with. Another similar fact is in relation to the production of the glumes. In Indian corn generally they are not needed, because the leaves are transformed into a husk, which envelopes the whole spike on which the naked seeds are arranged. There is a kind on exhibition here which pushes the spike out of the sheath or husk; and in this case the glumes are developed and form a covering to each seed, as in the case of wheat or oats or other grain. I believe this singular kind is called "Rocky mountain corn," but why I do not know. To many the appearances of these many varieties of corn, so seemingly different and all from one original, is astounding, while those who are very enthusiastic on developmental theories love to refer to them. But, in truth, the morphological differences are not very great. It is the appearances that are deceptive. The morphology of the male from a female primary flower shows a much more striking change.

Good Health.

Influence of Color on Health.

The influence of color in clothing upon the health of the wearer is a matter worthy of consideration. It is a well-known fact that a white surface throws back or reflects heat which comes in contact with it. For this reason, white or light-tinted clothing is better adapted to summer, as it reflects the sun's rays, and, to a degree, wards off heat.

It is an equally well-known fact that a black surface readily absorbs heat and freely throws out or radiates it. For instance, a steam radiator painted black will keep the temperature of a room considerably higher than if painted white, the heat producing agency remaining the same. This being the case, it would seem that black or dark clothing takes up and throws off a greater amount of heat generated within the body, and is, therefore, not as good as white, even in winter weather. Let any one who has worn dark socks, and been troubled with cold feet, change to white, and see if the results are not beneficial.

But there is an influence exerted upon the health by white or black clothing of far greater importance than that relating to heat. Every one knows that black absorbs or rather extinguishes all the rays of light, and reflects none. Every one ought to know that light is an essential agent in the preservation or restoration of health. Now, a person clad in black is surrounded by an atmosphere wanting in light by just so much as is extinguished by his black dress, and the constant wearing of black deprives the wearer and all who come near him of certain elements necessary to physical and mental well-being; which fact, sooner or later, manifests itself in a deteriorated condition of both body and mind.

Black was for ages worn almost exclusively as a symbol of mourning. It denotes sorrow and sadness; it was intended to keep before the mind unpleasant thoughts, and it is fit for this and this alone, for it inevitably exerts a depressing influence. In fact, it will engender physical conditions which have for their sequence unpleasant thoughts and feelings, born of the lack of light.

The present universal wearing of black was a concomitant of the war, which made everybody mourners, and when the grief was assuaged, black had become "the fashion"—more's the pity, for fashion's chains are so closely welded that it is almost impossible to break them, even though health be sacrificed at her shrine.

The immediate effect of black surroundings is upon the nervous system, and through it upon every tissue of the body and imagery of the mind. Men's clothing being less voluminous than women's presents a less surface for the extraction of light, and is proportionately less in its ill effects.

Color is an important agent in the cure of any disease in which the nervous system is involved. It is equally effective in the preservation of healthful conditions of body and mind; and when these facts shall have become known and appreciated, it is to be hoped that the wearing of black will be discarded, and its accompanying evils overcome.

Bright colors tend to enliven and elevate the spirits; but constant contact with them will exhaust the nervous force by over-stimulating effects. The light, neutral tints soothe and quiet the nervous system, and are best for constant wear, particularly among our American people, who are given to both excitement and depression; while black and very dark colors tend to depress, by depriving the nerves of their proper and legitimate nutrition, which is light in all its purity and beauty.—*Science of Health.*

Dangers of Breathing by the Mouth.

Dr. Gaye, in the London *Medical Record*, directs attention to the evils of breathing by the mouth. To appreciate these it must be remembered that the functions of the nose in respiration are threefold.

1. The olfactory sense secures it against the entrance of impure air.

2. The moisture of the nasal passages gives a certain degree of aqueous saturation to the inspired air, the contact of which is thus rendered less irritating to the mucous membrane of the throat and larynx.

2. The inequalities of the organ retain solid particles suspended in the air, which is proved by the quantity of dust sometimes found accumulated in the nostrils. These functions are all lost in breathing by the mouth. Further, the contact of dry air soon produces circulatory troubles in the pharyngeal region, and even an habitual catarrh, susceptible of easy transmission by continuity to the eustacian tube and cavity of the tympanum. Granular adenoid pharyngitis often has this origin. Niemeyer believed that attacks of pseudo-croup in children have their origin in dryness of the glottis produced by oral respiration. To enable the patient to breathe through the nose we must restore the nose to its proper condition, and then in children stop the mouth by an impervious respirator. Many cases of catarrhal deafness were cured in this way alone.

Fruit for Worms in Children.—Dr. M. L. Holbrook, a good while ago, in speaking of fruit as food said: There is one other value in fruit which I cannot pass over in this connection without notice. One of the common diseases of children is worms in the bowels. If a child's digestion become impaired and the gastric juice become weakened or defective in quantity by overeating or bad food, the whole alimentary canal becomes clogged up and filthy, and furnishes nests for such worms as will breed there. In this weakened condition of the system, they cannot be destroyed by the process of digestion, and hence great harm comes from them. Now, it is an interesting fact that fresh ripe fruit is the best preventive for this state of things. Dr. Benjamin Rush pointed this out a hundred years ago. He made a series of experiments on earth worms, which he regarded as more nearly allied to those that infest the bowels of children than any other, with a view to test their power of retaining life under the influence of various substances that might be used as worm medicines. The results proved that worms often lived longer in those substances known as poisonous than in some of the most harmless articles of food. For instance, in watery solutions of opium they lived 11 minutes; in infusion of pink root, 33 minutes; in claret wine, 10 minutes; but in the juice of red cherries they died in 6 minutes; black cherries, in 5 minutes; red currants, in 3 minutes; gooseberries, in 4 minutes; whortleberries, in 7 minutes, and raspberries, in 5 minutes.

From these experiments Dr. Rush argued that fresh, ripe fruits, of which children are very fond, are the most speedy and effectual poisons for worms. In practice this theory has proved to be correct.

Remedy for Lockjaw.—Dr. John Imray reports most favorably on the effects of the simultaneous use of opium and chloral hydrate in cases of tetanus, both idiopathic and traumatic. In the tropics this disease exhibits a frequency and a violence unknown in more temperate regions, and with the sole exception of hydrophobia, there is perhaps none so unsatisfactory as regards treatment, or so painful to witness (and usually so fatal) as tetanus. Hence the doctor's mode of treatment promises to be of great value. Three cases were treated successfully by the new method—namely, keeping the patients almost continually under the combined effects of chloral hydrate and opium tincture until all tendency to the recurrence of tetanic spasms had disappeared. As it generally happens that all power of digestion is lost in this disease, it becomes necessary to administer both the medicine and food by means of an enema. The power of these combined drugs in controlling and repressing the tetanic spasms is indeed very remarkable, and Dr. Nicholls, who had the patients under his charge, likens it to the action of a heavy weight on a spring, which if the pressure yielded, the spring began to rise, but being continually maintained, the morbid nervous phenomena gradually gave way, and the disease was finally vanquished.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Saturday Morning, Sept 2. 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Centennial at Philadelphia; Chain Making, 153. Comstock Papers; Cordage Manufacture, 160. An Improved One-Rail Railway; Globe Mining District, Arizona, 161-4. Patents and Inventions, 165.

ILLUSTRATIONS.—Grain Making at the Mechanics' Pavilion, 153. James' Single Track Railway, 161.

CORRESPONDENCE.—Alpine County—Its Mines and Resources, Past, Present and Future, 154.

MECHANICAL PROGRESS.—A Boot Polishing Machine; New Iron Making Process; Piece Work; Speed of Wheels and Pulleys; Machinery of the British Fleet; Beating England on Her Own Ground, 155.

SCIENTIFIC PROGRESS.—Insanity in the United States; Meteorological; Electric Experiments; Local Botanical Points; Direct Proof of Evolution; New Process for the Manufacture of Dextrin; Prizes for a New Bleaching Agent; The Arrival of Professor Huxley, 155.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 156.

MINING SUMMARY from various counties in California, Nevada, Montana and Oregon, 157-158-164.

USEFUL INFORMATION.—How to Make an Emery Wheel; Straightening a Heavy Shaft; English Trade Marks; Files; Influence of Climate on Indian Corn, 159.

GOOD HEALTH.—Influence of Color on Health; Dangers of Breathing by the Mouth; Fruit for Worms in Children; Remedy for Lockjaw, 159.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 164 and other pages.

MISCELLANEOUS ARTICLES.—Magnitude of our Hydraulic Mining Enterprises; Altitude of Our Hills; Switchmen Sounding the Locomotive Whistle, 154. Oppressive Figures; Tulloch's Ore Feeder; The Transplantation and Implantation of Hairs; Wire Work; Hawkins & Cantrell's Steam Hoisting Engine, 158. The Hawaiian Treaty; Laud Law Decisions, 159.

NEW ADVERTISEMENTS.

Averill Mixed Paint, California Paint Company, S. F.; Single Track Railway, David B. James, Visalia, Tulare County, Cal. Cincinnati Gold and Silver Mining Co.—Assessment; Stock Broker, James Patterson, S. F.

THE MINDELEFF PROCESS.—The Mindeleff reduction company advertise for refractory gold and silver ores and also invite mine owners to forward them such ores, in lots of not less than three tons, in order that the practical value of the process may be demonstrated. This company unquestionably has the utmost confidence in their enterprise, as they have erected complete works in this city at an expense of not less than $25,000, and are now in the market for rebellious gold and silver ores. We understand the works of the company are open so that either experts or persons interested in the ore being treated may be present and see the entire manipulation. All we need say is, if the process is a success the company have "struck oil."

LARGE FIRE.—Again are we called upon to record a terrible catastrophe in the shape of fire. A whole block, bounded by Brannan and Townsend streets north and south, and Third and Fourth streets east and west, was almost entirely destroyed, leaving hundreds houseless, and throwing 90 sick out into the night air from the German hospital, which was destroyed. Loss is variously estimated from $600,000 to $1,000,000. The fire commenced in the Pacific box factory, and high wind and scarcity of water caused the great destruction. Three lives were lost.

THERE is a great deal of crime in Pennsylvania, chiefly caused by the "Molly Maguire" organization, which has systematized outrage and murder. A blow has been struck at them by the conviction of nine of the desperadoes, at Pottsville, Pennsylvania, of murder. The Molly Maguire prisoners—Manley, McGeehan, Carrol, Roarity, and Beiley—recently convicted of the murder of a policeman at Tamequa, Pa., have been sentenced to death.

Comstock Papers.

NO. 5.

A Hard Winter and its Results.

The winter of 1859 commenced early, as much as a foot of snow having fallen at Virginia City on the 2d of November; and, although this storm was succeeded by several weeks of pleasant weather, the winter that followed was a severe one. As yet not more than a dozen comfortable houses had been put up at Virginia City and Gold Hill; wherefore the several hundred adventurers who had gathered at the mines were compelled to live and lodge in tents, canvas houses, and stone built huts and such other temporary abodes as could be constructed from the rude and scanty material at hand, there being very little lumber to be had. Some, whose means were not very abundant, borrowed Indian fashion in dirt-covered holes dug in the ground, while a few even found shelter in the mouths of the tunnels that had been started for opening up the mines. The public lodging houses were well patronized institutions, every inch of space, even to the floors, being pressed into use for sleeping purposes. In these places rows of bunks, reaching from floor to ceiling, one above the other, ran around the sides, with a double tier extending through the center of the building, each of these shelf-like bunks being furnished with a coarse hay mattress and a limited supply of woolen blankets. Of nights, chairs, tables and counters were made to do service as bedsteads. For this sort of accommodation one dollar per night was exacted, lodgers being charged half price for the privilege of spreading their blankets on the floor.

Huddled into these miserable dormitories, the weather much of the time stormy and intensely cold, a good deal of suffering was experienced before the winter was over; nor were the unhappy lodgers permitted always to enjoy even this sort of shelter without interruption and disturbance. Frequently the gales that came careering down the sides of Mount Davidson would, in the middle of the night, when all were wrapt in sweet slumber, dreaming of rich croppings, black sulphurets and wire silver, rend to tatters their canvass dormitory, or taking it up bodily turn the thing inside out, leaving the hapless sleepers exposed to the pelting of the pitiless storm. To aptly describe the scenes that attended the sudden uncovering of these embryotic silver miners, howling and swearing as they sought to screen their half-naked persons under the fluttering fragments of their disrupturned tabernacle or hastened off through the storm in search of shelter elsewhere, would require the pen of a Dickens.

A Hopeful Crowd and a Winter Emigration.—High Prices of Provisions and Provender.

But notwithstanding their miserable situation few of these sojourners in the new El Dorado grew disheartened or sought greater comforts by a return to California. On the contrary, such was their confidence in the mineral wealth of the country, that they resolved to hold out at all hazards till spring, when they believed they would be able, on the disappearance of the snow and the advent of good weather, to verify all that had been said of the richness of the mines and realize their fondest expectations. The high hopes entertained by those already over the mountains had the effect to so stimulate the excitement in California that quite an emigration was kept up throughout the winter, the population collected at the new mines having amounted by the end of April to about 2,000.

By this time the condition of things had become decidedly rough. The winter had proved to be one of unusual length and severity. The early settlers in Carson valley, a shiftless people at best, not having expected such a large influx of population nor anticipated so hard a winter, had failed to provide for these contingencies by gathering more hay and raising more farm produce than usual. Having their attention absorbed by mining matters, they had, in fact, made hardly as great provision of this kind as in ordinary years. The consequence was, there soon began to be a dearth of these commodities, the prices advancing to enormous rates before spring. Hay, for example, sold at the rate of four and five and barley at six and eight hundred dollars per ton, provisions of all kinds being also excessively scarce and dear. Many of the horses and two-thirds of the cattle in the country died from starvation. The simplest fare, such as hardly more than sufficed to keep life in his body, cost the miner three-fold more than the most luxurious living would do in California. Believing, however, that relief would come with the spring, all bore these burdens and deprivations bravely. Knowing that supplies of all kinds would be rushed in from California as soon as the mountains became passible to pack trains, there was little murmuring or complaint.

Things Get a Set-Back—An Indian War Foolishly Begun and Disastrously Ended.

While all were thus hopeful and patient and were even in the best of spirits, there occurred one of those foolish and fatal events which, through the want of a little forethought and practical sense on the part of the multitude, result often in disaster alike to individuals and the community at large. There were living on Carson river, 20 miles below Virginia City, three brothers named Williams, who there kept a sort of public house, their reputation for square dealing being none of the best. Among other evil practices imputed to these men was that of cheating the Indians and grossly abusing their squaws, on which account the Pah Utes cherished towards them a deadly animosity, awaiting only a favorable opportunity to be avenged upon them. Accordingly, one night, early in the month of May, 1860, a small band of savages attacked the house of these brothers and slew the occupants, four in number. It so happened that three of these were strangers, merely stopping there over night, only one of the Williamses having been among the slain. However much the brothers themselves might have deserved the fate that had overtaken one of their number, this butchery of innocent parties was not to be overlooked, nor would it do to allow the savages to redress their wrongs, fancied or real, in this summary way, anyhow. As soon, therefore, as

The News of the Massacre

Reached the settlements, it was determined that the guilty parties should be sought out and punished. As the Indians, before leaving, had set fire to and burnt up the house and all that was in it, the names of the strangers killed were never ascertained, they probably having been miners prospecting in the neighborhood. It was well known that only a small number of Indians had been engaged in the killing and that the head men and great mass of these people know nothing about it. Wherefore the older settlers in the valley advised that a few of their own number should visit the principal camps of the Pah Utes, and consult with the chiefs about the affair, offering a reward for the apprehension and surrender to the whites of the guilty parties and threatening the whole of them with punishment if the offenders were not found and given up. Had this course been adopted the criminals no doubt would at little expense and trouble have soon been secured and properly dealt with. But there had by this time collected in the new mining region a good many young men, brave and chivalrous but impulsive and inconsiderate, who were not inclined to pursue this wise and considerate course, believing and advocating that an armed force should at once be fitted out and sent to inflict upon the savages instant, severe and indiscriminate punishment. Endorsing this view were a few men of a different stripe—men of ruffianly proclivities, who, believing that an Indian war would furnish them employment at the public expense, and possibly afford opportunities for securing Pah Ute ponies at a cheap rate, did all they by in their power to promote a scrimmage of this kind.

The Avengers Go for the Savages but Meet With a Repulse.

The party of violence being thus in the ascendant, a company of something over a hundred men was raised, armed and mounted, and, under the command of Major Ormsby, of Carson City, started down Truckee river intending to first clean out the Indian rancheria situate on the border of Pyramid lake, at the mouth of that stream. The Indians, however, having got wind of their purpose, entrenched themselves behind the rocks on either side of a narrow gorge along the river through which their foes had to pass. The whites, ignorant of their presence, marched into this defile and when half-way through it were fired upon so suddenly that they were thrown into confusion and obliged to retreat precipitately, not being able to make any effective resistance. The Indians making pursuit killed some ten or fifteen of their enemies, wounding as many more, Major Ormsby having been amongst the slain. Only after they had drawn them from their covert did the whites succeed in killing any of the Indians, the number of the fallen having been about equal on both sides.

A Big Scare and a Bad Business Altogether.

When the discomfited survivors reached Virginia City, great was the excitement that at once ensued, it being generally supposed that the savages, emboldened by their success, would instantly march upon that place in overwhelming numbers. Consternation everywhere prevailed. Nothing was thought of but defense against the approaching foe, whose movements were watched by scouts sent out for the purpose. The approaches to the city were guarded and sentinels stationed on the hills around. The women and children were gathered into places of safety, the most of them having been corralled in a large half-finished stone house put up by Peter O'Reilly, which was then strongly barricaded. Couriers were dispatched to California, advising the people and authorities there of the critical situation and imploring them for aid; arms, troops, ammunition, grub and whisky having been hurried over the mountains in response to this call. Arriving, these auxiliary forces joined the veterans already in the field, and soon between three and four hundred men, well equipped and officered by Jack Hayes and other experienced Indian fighters, were on their way to give battle to the dread Pah Utes, every man of them fairly bloated with valor and a fixed determination to exterminate the hated race, leaving not so much as a papoose or a mehela behind. But the hated race had got well out of the way, having run off into the northern deserts, where the whites, finding they could not reach, decided not to pursue them. The Indians had, in fact, retreated north immediately after the fight on the Truckee, having been running in one direction while the whites were running in another. Nobody was therefore killed on either side during this second expedition, which returned to the abodes of civilization and the pursuits of peace without scalps or glory.

This scars, which had, as we have seen, so little foundation in fact, proved a serous detriment to all the leading interests of Washoe. To say nothing of the heavy public debt entailed by it, the country was set back fully a year through the alarm created and the check put upon enterprise and the influx of capital and population. Had the writer consulted his feelings alone he would have ignored the story of this miserable business altogether; but a sense of duty has constrained him to allude to it thus briefly, that a lesson so instructive might not be wholly lost to the future.

Cordage Manufacture.

In the center of the main floor of the Pavilion, almost immediately on entering, the visitor comes to the exhibit of the San Francisco Cordage Co., the rope makers of the Pacific coast par excellence. The display consists of several coils of baling rope and some thirty coils of three strand rope, from one-fourth inch clothes line up to three inch hawsers. Some are beautifully white, made from the fiber of the maguey of Mexico. Some of darker hue of Manila, and some tarred hawsers for use in mines where water is abundant. Surmounting the whole is a large mass of the raw material from which the rope is manufactured, waving like the blonde tresses of the rustic Saxon wench, and at a masquerade would do duty as such quite creditably.

Their factory is located at the Potrero, not far from the Southern railroad depot, and is very extensive, employing about 100 hands in all, and being the largest factory of the kind on the Pacific coast. Their office and salesroom is at 611 and 613 Front street, where they have a large two story building filled with a well assorted stock, and by telegraph can order from the factory any special kind required, and have it manufactured and shipped within 24 hours.

Messrs. Tubbs & Co are making considerable of the light colored rope on exhibition for inland use. It is not quite so strong as the Manila, but the material is much cheaper, and for ordinary uses it is sufficient, and is in general use in the East. They have completed arrangements for the direct importation of the raw material from the Mexican coast, which is called Sisal hemp, and, as we before stated, is the fiber of the maguey, a species of aloe. Manila is the fiber of the plantain, which much resembles the banana tree.

The capacity of the factory is about five and a half million of pounds per annum, but it is not run constantly, as the supply would exceed the demand. They could easily manufacture all that would be required in our market, but are content to take the largest share of the patronage, and leave the balance to others. Their display is worthy of inspection, and so also is their factory.

MINING ACCIDENTS.—Six men were killed at the Benton mill tunnel, Mariposa county, by a premature explosion in the face of the main tunnel. A set of holes, 18 in number, had been loaded and were ready for explosion, when Mr. Ethelridge Hunt, to whom the management of the battery was entrusted, attempted, as usual, before firing, to test it—that is to send a current through the wires to see that everything was in order and readiness for the explosion. If the connections are all perfect, this test current rings an alarm bell, and all hands clear away to places of safety in the cross drift. It seems that on this occasion the bell failed to ring, indicating a break in the wire between the battery and the face. As customary in such cases Mr. Hunt took the battery up to the face in order to test the wires back from joint to joint, as that is deemed the most expeditious way of finding a break. The wires had been again connected with the battery, and it is supposed that Mr. Hunt, at this time, being in a state of slight confusion, as men are apt to be when anything goes wrong about Hercules powder, touched the wrong key, sending the current directly through the several explosive in the face, instead of back down the wires as intended.

An accident occurred at the Ophir mine on the 29th, which damaged the machinery about $1,000. The cage caught in the shaft and the rope was let down in it. This cable fell over into the central compartment and fouled the other cage, which was coming up, bringing a heavy strain on the machinery and causing the damage mentioned.

A miner named John Welsh was killed at the Centennial mine, Virginia, on the 29th, by the explosion of a box of powder.

THOMPSON & FERGASON are running their shingle mill at Camp 16, near Truckee, night and day. They have 15 men in their employ, and have manufactured and sold over 8,000,000 shingles this season. They calculate on making in the neighborhood of 7,000,000 more before the heavy snows come and compel them to shut down.

THE crowded state of our columns necessitates the postponement of our usual "Notices of Recent Patents," until next week.

A REDUCTION of 20 per cent. in printers' wages has been made by the typographical union in Baltimore.

An Improved One-Rail Railway.

The accompanying illustratioas sbow the details of oonstruction of a new aad improved car for siagle-rail railways, inveuted by David B. James of Visalia. The inveution consists of one liue of broad-faced wheels in tbe ceuter to carry the load, and guide-wbeels to raa each side of the rail oa vertical axles projecting down from the car, the wheels being to kaep tbe carrying wheels ou the track and to prevent tbe cars from overtnruiag, for which they are coatrived to gripe the rail with more or less force. The wheels ars conaected witb a platforai which is carried only enough higher tban the rail to clear it properly, and the car is mouated on pivots arraaged in tbe line of the wheels aad supported ou tbe platform so that the load is balaaced oa the wbsels and the ceuter of gravity ia lowered as much as possiblo to preveat overtaraing. The guide wheels rnniug against the sides of the rails are coatrived to move forward aud from the rail, aad provided with springs to keep them in coatact. In the locomotive they may be geared with tbe power, aud bave a lever coutrivance for grippiag tbe rail tigbtly for treotiou on steep grades.

Figure 1 of the engraviugs is a longitudioal sectional elevatiou of the improved railway car, showiag the guide wheels, ridged aad ruuniag in a groove in the striager. Figure 2 is a horizontal sectiou, giving an ead view of the car and track, striager aad ties, with side wbeels, tbe ridges ia which fit into the groovo in tbe stringer. Figare 3 sbows tbe arraagement of the side or gaide wheels with the set screws sud spring to regalate the force agaiust the stringer.

Iu the engraving, *A* is tbe siugle rail, of wood, whicb may he of a single timber, or it may be sbod on top with another, to be removed from time to time wben worn, the removable oue being, say from two to tbree inches thick. *B* represeats the ties, whicb may he of any snitable kind. *C* represents the carrying wheels of the car; *D* the wheels for guiding it, and preventing it from overturning, the latter wheel s being mounted on vertical axles, *F*, projecting down from the car body or supports, *I*, so thet tbe wheels ruu agaiust the edges of the rail while the wheels, *C*, ruu on top. Tbe axles, *F*, are mouated iu bearings, *G*, which aro movable toward and trom the rail, aud have springs to press them against it, by which they are accommodated to variations in the thickness of tbe rail, and allow the car to tnrn curves readily witboat requiring the wheels, *C*, to be mounted on a pivot, or fifth wheel.

The car body, *J*, is mounted on the pivots, *K*, supported on the platform, *L*, which is suspeuded from the axles of the wheels, *C*, the said pivots being arranged in the longitudiual plane of the wheels, *C*, so the ceuter of gravity of the load remaias more ou the wbeels thau it otherwise would, and the car is more certaia of keeping erect in case the load is not trimmed nicely, or the car is jarred or otherwise forced laterally. Bat to preveut the car from rockiug too muoh ou the pivots aud also to prevent it from striking too hard ou the platform in case it does rock, baffer springs, *M*, are attached to tbe under side of the car body so as to strike the platform, or tbey mey be applied so that the body may strike against them.

The platform will always ran level on accouut of using only oue rail and employing the guide wheels to direct the car, which avoids the necessity of tiltiug tbe car as on the curves of the roads of two rails, and thus the difficulty of carrying the cars upright on a single track is greatly diminished.

If considered necessary, the carrying wheels may be banded witb rubber to prevent weer of the wood rails and for ruuniug smoothly, but it is believed tbat the broad surfaces will wear so little as not to need it. By gearing the guide wheels of the locomotives with the driving wheels, aud employing levers to canse them to gripe the rails, very steep gradee may be asceaded. Very abrupt curves cau easily be overcome by meaae of this system, as ben, of course, steep grades. The engineering difficulties of a line in a mouutainous country could therefore be overcome by it, like a narrow gauge road overcomes the difficulties of a broad gauge under sucb circumstances. The stringer is fastened to the ties with irou knees. In figure 3, the spaces between the heavy spring, *H*, may be filled with rnbber wedges. The set screw, *P*, works against a plate that works against tbe upper and lower springs to regulate the force against the stringer.

As any oue cau see, the construction of a road such as this would be very simple aud cheap. In a well timbered country the whole road could be made of material near at hand. As branch roads from small towns, this system would be advantageous, as heavy loads cau be cerried witb a small expeuditure of power. Almost any one can see the advantages possessed by a road of this kind under certain circumstances. A model has been placed on exhibition at the Mechanics' fair, where it can be examined in detail. Those desirous of further information can address the inventor as above.

FIG. 1. ELEVATION OF JAMES' PATENT CAR FOR ONE RAIL RAILROAD.

Globe Mining District, Arizona.

EDITORS PRESS:—Globe miniug district was organized about twelvs moutbs ago. At that time it was confiaed to Piual coauty, bnt since tben a large tract of laad has been cut off from the Saa Carlos Indiau reservatiou and added to the district, said addition being in Maricope couuty, and inclades the great Apache monntaias, ia the northeast part of the district, formerly knowu as the sacred bome of the ancient red men, who have been heretofors tbe great bugbear that has retarded the developmeat of this section of country, wbicb has produced silver ores from the surface, witbin tbe last six months, second to uo others previously discovered in aay part of ths Wastern States and Territories, not only on account of their richuess in iatriasic value, but for their mineralogicel combiaations aud crystallization. In tbis article I refer priucipally to the

Northeastern Portion of the District,

Which is in Maricopa county. The great Apache mountaias run ia a uortherly aud soatherly course, the eastern slope of whioh form tbe gulches and creeks that constitute the headwaters of the San Carlos river, that empties into the Gila river at the San Carlos Indian agency, distance about 35 miles soutbeasterly course. From tbe western slope tbe waters from the canyons run into Piual creek, which latter forms a junction with Salt river about 15 miles from the apex of the great Apache mountains.

Tbe greater portion of the district surface is principally small, undulatiug hills, covered with luxuriant grasses the whole year. The

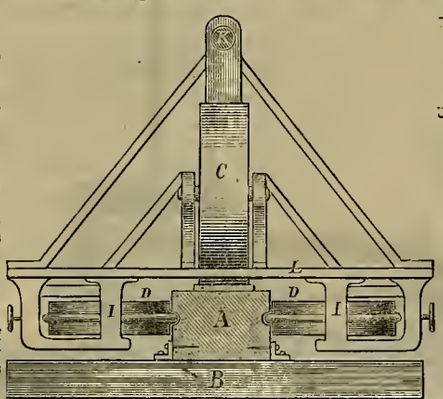

Fig. 2. End View of Wheels, Guide Wheels, etc.

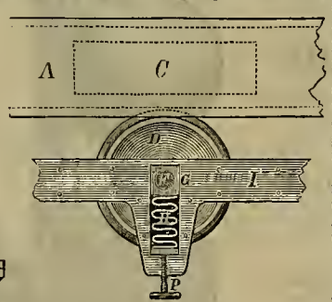

Fig. 3. Arrangement of Guide Wheels

mescal grows here very abandautly; I believe it to be

A Species of the Maguey,

Coutainiag a great amount of sugar. It formerly served the Apache Indians with the nourishment wherewith to sustain their diabolical vitality wbile raiding on the pale faces. The plants are cut down aud the thick leaves trimmed close to the butt, which varies from a few inches to a little more than a foot in diameter; they are then put into a mescal pit built of stones and earth (principally in the gulches and cauyons), where fire is applied and rocks heated. The plants are placed in the bottom and covered over with heated rocks and earth, where it is allowed to remain 48 hours to roast, and is tben ready to be used as food. Although they now draw their rations of provisions at the San Carlos ageucy, tbey are so habituated to use it that they procure passes from the Indian agent to allow them the privilege to burn mescal. Many Apaches have been engaged the last two months in this branch of their industry in a very peaceable manner among the miners, invariably showing their pass to be absent a certain number of days off the reservatiou.

Water

Is somewhat scarce, but tbere is sufficient for consumption aud to treat tbe ores of tbe district by steam power. Wood is also scarce in the vicinity, but plenty in the Pinal mountaias, about ten miles southwesterly. Salt is abundant on Salt river, within 15 miles, and at some parts of the district only 10 miles, which will facilitate considerebly the redaction of a certain class of silver ores found in this portion of the district, which require to be treated by the chloridiziag process in order to save a largo percentage of the silver the ore contains, i. e., silver glance, brittle sulpharet of silver, black salpbide and tennantite, all of which are here associated with blue and grey malachite.

The First Mine Discovered

In this part of the district is called the Champion, located late in 1875. The Champion company had 250 pounds of ore smelted at a rude Mexican furnace, which yielded 35 pounds of pure silver, and eight pouads of silver were afterwards taken from tbe slag.

It is situated on the southwestern slope of Chromo butte, (the reservation line now is marked out over the butte, leaviag the Champion about one-qaerter of a mile outside of the boundary,) and about 200 yards from the gap or gorge in said Chromo batte, which is somewhat isolated from the great Apache mountains. This mine is on the eastern border of tbe mineral belt which crosses the district in a northeasterly and southwesterly course. This course refers to a number of mammoth fissure lodes, ledges or veins that are traceable for several miles and pre-empted under different names, varying from three to fifty (and I might say more) feet wide, which I will classify separately, of which the Champion is the first. It is in the syenitio grauwacke gronp, inferior, stratified series, traasition rocks of the upper silurian or lower devonian of the geological systems. It is quite immaterial to which it belongs, as both of them abound in the precious metals. This group of rocks at

Ths First Mine Discovered

Ths Champion vein is about thrss feet wide, well defiaed, betwesa two walls of grauwacke, (syenitics) witb a dip about 10 deg. to 15 deg. from ths perpeudicular, northwesterly. The gangue or matrix is priacipally composed of sulphats of berya, silica, mixed with carboaate of lime aud ergillaceous earths. Near the surface the preseat workiags are about 22 feet, deep, opsn cut. The matrix is in a high state of crystallization, producing large aud beautiful specimens of crystallized chlorids of silver, associated witb argillaceous chloride of silver, brittle sulphnret of silver, silver glauce (ergentite), and the result of the decomposition of the two latter varieties, produced by surface inflaeaces, black sulphide of silver, after the upheaval aud infiltratious of salt water into the veiu, whiob undoubtedly produced the chloride by the natural process termed metamorphism. I will also state here that

Free Gold

Is fonnd in this fissnre vein, chiefly coafined to those rocks that are qnartzose in their character, interspersed with miaeralized brown gneiss, especially where white quertz, decomposed feldspar and chromate of iron predomiaate. This portion of tbe stratnm is to a certaia degree more or less auriferous. I believe it to have been deposited by iafiltration, the gold being in solntion in the salt water, while the stratnm was inundated aud subseqnent y precipitated in the gangue or matrix of the vein by the excess of iron in the same, assisted in their depositiou, (tbe chloride and free gold,) by the decomposition of one chemicel substance actiug on another with whioh it has aa affinity, conjointly produciag a kiud of electro-metallurgy, by the polar electric carrents. All nature is in process of growtb and decay. "We either gain or lose, or sink or rise, nor rests our struggliug natnre till she dies!" Which is only a state of transformation. The analogy holds good in the three different kingdoms; as electric enrreuts maintain the vitality of the animal kiugdom produced by the decomposition of certain chemical compounds introduced into the system, so the vegetable kiagdom also is entirely depeadiag for its vitality on the absorption of certain alkaliue salts extracted from the earth, aud moisture, which form the electric currents that maintain its vitality. The seme law governs the formation of differeat species of miueral combiaatious; it is the result of affinity or molecular attractiou, for, let it be naderstood that whether in the animel, vegetable or miueral kingdoms, there always exist kiudred associations—affiuities—"like loves like." Among minerals, atomic agglutination aud crystallizetion are constantly goiag on, and whether tbe snbstaaces uudergoiag these changes (pseudomorphism) are iron, silver, gold, etc., when in solntion tbe fiaal results—metallio or earthly solids—are the seme.

Followiag the course of the Champiou iu a northeasterly direction four miles, we have the same formation on the east slope of the Apaches, where the fissures agaiu crop out at the surface, several feet wide, the Stonewall, Haunibal and

Several Other Locations

Producing rich ore at the surface, while in their immediate vicinity many cross-courses (northwest aud southeast) intersected by counters, east, southeast aud west northwest invariably being their course. They were first discovered late in Februery, 1876, and meny toas of exceedingly rich ore have been taken from these counters and cross-courses, held under many locatious, as the Almaden, Little Mary Ann, St. Louis, Little Mac and many other. Specimens from these lodes are mostly kerargyrites aud argentite, marked nnmber 1, in the specimens I send you with this letter.

One fissure vein from tbis extreme northeast part of the district is located for five miles continnously in a southwesterly course. It crops out at the surface every few hundred feet, about half a mile southwest of the apex of the Apaches. It is known as the Sherman lode here. It is somewhat broken up, and many cross-courses aud counters iatersect, carrying silver ore, as per samples No. 2, coutaining chloride, iodide, bromide, brittle sulphuret of silver (stephanite), argentite[and a little malachite, worth over $10,000 per ton. I've seen qu ntities of this grade of ore taken from the Sherman, Chromo, Treasure Vault and many others in the vicinity, averaging over four tons of first class from surface workings not more than 12 feet deep; still the lodes when in place are still going down in rich ore, averaging from six inches to two feet between walls, with a dip about 15 from the perpendicular.

These mines were loceted early in February, 1876, but little development has been done on most of them, principally on account of the many disedvanteges the miners of this district are laboring under, of which I will illustrate

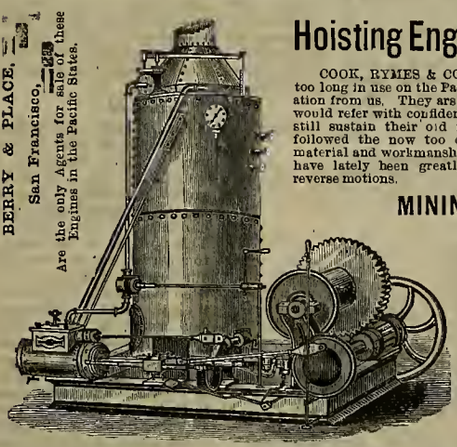
Best in the Market.

For Sale only at BERRY & PLACE'S MACHINERY DEPOT, San Francisco, Cal.

BERRY & PLACE, San Francisco, Are the only Agents for sale of these Engines in the Pacific States.



Hoisting Engines. Mining Engines.

COOK, RYMES & CO.'S celebrated Hoisting Engines have been too long in use on the Pacific coast to require any special recommendation from us. They are well known from Alaska to Mexico. We would refer with confidence to any one of the hundreds in use. They still sustain their old reputation, the manufacturers not having followed the now too common practice of reducing the quality of material and workmanship to compete with cheaper engines. They have lately been greatly improved by adding large drums, and reverse motions.

MINING HOISTING ENGINES.

(Manufactured by the same parties.)

Our new Mining Engine is built from plans and specifications of several of our MOST SUCCESSFUL MINING ENGINEERS, and the result is the most complete

Double Drum Hoisting Engine

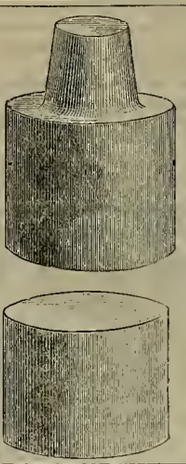
Ever built. Their advantages will be seen at a glance by any one familiar with the necessities of a mine. These engines may be seen in use in Ophir, Con. Virginia, Chollar, Europa, Niagara, Leviathan, Phil Sheridan, and several other mines on the Comstock Lode. For sale only at

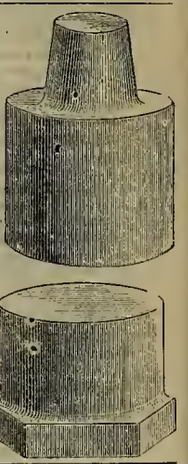
BERRY & PLACE,

(Successors to Treadwell & Co.)

PATENTED

CAST STEEL SHOES AND DIES.





Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly steemed and regarded by its readers; containing, as it oes, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

(Continued from Page 158.)

Montana.

MILL ITEMS.—Butte *Miner*, August 19: The Dexter got steam up Friday morning and is running one pan and settler. The amalgamating is little behind the stamps and furnaces, and it is expected that by this means everything will be cleaned up and when a new start is made, all will work together. It has been decided to wait until Mr. Allen is ready to cast and have the new cog-wheel made there from the improved pattern. This involves a little delay in starting, but it will probably obviate any stoppages in future from similar causes. At the Centennial all is working well. Good results are being obtained from the Burlington ore. One silver brick was sent off Wednesday and another will be shipped to-day. The second Purvine pan arrived yesterday. This mill is doing good work and we hope soon to be able to record the fact that ten stamps are in motion. Work on the La Plata lode will be resumed Monday next with a full force of men. It is stated that a good vein of copper ore has been struck on the Aleck Scott lode. We saw a specimen from there this morning which shows very rich. A portion of the flume in the west fork of the Silver Bow mining ditch was carried away during the late rains, but is being rapidly replaced and work will soon be resumed. Work is progressing rapidly at the Butte foundry and it begins to assume a business-like air. The cupola shell is in place and Mr. Allen commences lining to-morrow. Both of the Phillipsburg mills are running on full time. The Quartz Hill mines, in the Upond district, are coming into favorable notice, and great expectations are indulged for them. An unusual quantity of gold dust was brought into Virginia City last week.

Oregon.

GRANITE CREEK MINES.—*Bedrock Democrat*, Aug. 23: From W. H. Thompson, who is just from the mines at Granite creek, we learn that everything is flourishing in that section. He informs us that S. B. Parrish bonded the Granite Creek mine on the following terms: They, the present owners, to work the same for the period of 60 days, at the end of which time Parrish pays the owners half of the amount, $36,000, for which said mine—the Monumental—was bought, the balance, $36,000, to be paid at the end of 90 days. The Beagle Bros.' pack train started from this mine last week with rich rock for Umatilla; the rock will be taken to Portland to be tested. The owners of this mine are Messrs. Klopp (two interests), Isaac Nail, W. L. Burnham, Thos. McDonald, Harvey Robbins, W. Moore and Harry McCann. Klopp and Nail have another mine equally as rich as this, situated in the same vicinity. Mr. Thompson and J. B. Gardner, of this city, started for Granite mining district yesterday morning. Next week we will call the attention of the people of Baker county to the wagon road which should be built to these mines from Baker City.

THE BURNT RIVER MINES.—From Ed. Parker, who has been on a tour of inspection to the Burnt river mines, we gather the following items: The Jasper mine is situated three miles northeast of Weatherby's ranch. The rock Mr. P. examined was very rich. This mine is owned by Judge L. O. Sterns, Wolf. Aucinger and Johnny Halpin. They also own another mine in the same vicinity called the Johnny Halpin. In three weeks time $90 was pounded (in a mortar) out of rock taken from this mine. The Bluna, McCord & Co. mine is situated in the same vicinity.

General News Items.

THE small-pox epidemic is on the decrease.

THE Indian campaign is considered at an end for the season.

THE Icelanders are emigrating from their country as fast as possible.

SOUNDINGS for the channel tunnel to connect England and France will be finished by the end of August. The engineers report that the result is very satisfactory.

NEW YORK city, with a population of about 1,000,000, pays taxes annually to the amount of $32,000,000; $10,000,000 of which is for interest on the city debt alone.

LETTERS from the U. S. fishery reservation on the McCloud river are very discouraging as to the prospect of obtaining a large quantity of eggs or young fish this season.

THE Delaware and Hudson canal company has issued a list of reduced prices for coal. The prices to contractors for coal discharged in carts in New York, per ton of 2,240 pounds, now stand: broken, $4 05; egg, $4.15; stove, $4 65; nut, $4 55. This is equal to about $1 55 per ton off from former rates.

A BANQUET was given in Paris to the independent delegates representing workmen who have just returned from Philadelphia. Des Moulines described their visit and others made speeches. Letters from Victor Hugo and Louis Blanc were read, and resolutions were adopted tendering thanks to their friends in America for the cordial reception given the delegates.

THE COUNSEL of Henry Ward Beecher, in the suit for alleged malicious prosecution, brought by F. D Moulton, have served upon the latter's counsel notice of an application for a change of venue, on the ground that the selection of an impartial jury in Brooklyn is impossible, because of the great division of opinion among those from whom the jury would have to be selected.

BULLION SHIPMENTS.—The bullion shipments of prominent mines since our last issue have been as follows: California, August 28th, $114,600; Leopard, August 29th, $6,200; Con. Imperial, August 26th, 10,000; Arizona, August 27th, $1,827; Northern Belle, August 24th, $7,577; Gen. Thomas, August 24th, $2,082.37; Northern Belle, August 27th, $9,468; Emigrant, August 28th, to date, $13,359; Ophir, August 23d, $44,353; Coso Con., August 24th, $1,250; Comanche, August 23d, $7,794; Con. Virginia has shipped up to August 25th, on August account, $220,653; California has shipped to same time $1,124,782; Ophir, August 25th, $20,030; Ophir, August 29th, $61,009; Chollar, August 27th, $13,936.

IN connection with the new aquarium now approaching completion in New York, will be an apparatus for fish culture, which will have a capacity of hatching from 50,000 to 100,000 trout at a single hatching.

[Continued from Page 161.

hereafter. These locations are about one mile and a half northwesterly from the Champion.

About a mile northwesterly from the Sherman is

Another Fissure Vein,

Also on the western slope of the Apaches, know as the "Lazy Bob"; the Meteor is the first southwesterly extension of the former. The vein at this point is well defined between two walls of syenitic graywacke, stratified, with a dip of 10 deg. to the northwest. The vein is here, where developed, three feet wide; its course is northeasterly and southwesterly, the matrix is principally quartz and brown spar; carrying ore from the surface composed of black sulphide of silver, malachites, siephanite and argentites; first class are worth over $2,000 per ton; second class, from 600 to 1,000 ounces per ton; pay streak about six inches. Specimens from this part are in package No. 3. About two tons of Lazy Bob ore have been sacked ready to be disposed of (at the owner's cabin) for more than three months; but there are no ore buyers in this district even at 50 per cent. discount. The Lazy Bob has a shaft developed 50 feet deep, showing a continuous well defined vein. It has been shut down over a month, with good pay ore in sight, for reasons which I will annex herennto before concluding. The Meteor has a shaft 85 feet deep, with a well defined vein. It was discovered early in February, 1876; it is now shut down. There is not a single break in the vein as yet as far as sunk on. Great credit is due to the owners of these mines for developing them under such terrible disadvantages as they have been laboring under in such short time. The Meteor is below water level, and with only a hide bucket to hoist with little draining if any could be effected. Several tons of ore are lying out on the dump from this mine, which is situated about the center of the mineral belt of this district.

About two miles northwesterly is the highest peak of the Apaches, which is about 1,500 feet above the Richmond basin.

A Spur of Mountains

Somewhat isolated from the Apaches runs westerly about three miles. Its base commences on the southeasterly portion of the Richmond basin. From the lithological combination of the rocks that constitute this spur, I am inclined to classify said spur as belonging to the azoic age on account of primitive granite accompanied with hornblend, being the rocks exposed for several hundred feet in hight along the course of said spur, through which passes several veins, of which the Helen is the most conspicuous. It was discovered February 10th, 1876. Its location is about six hundred feet above the Richmond basin, northeast and southwesterly course, almost a perpendicular vein about eighteen inches to two feet wide between walls of granite of the gray variety. The shaft is now 25 feet deep, with from three to six inches as per samples No. 4, of ore averaging over two thousand dollars per ton, composed of (on the surface) silica, sulphate of baryta, black sulphide of silver, chloride, brittle sulphuret of silver, argentite and malachite, the three last mentioned predominating at the bottom of the shaft.

At the base of this range many varieties of metamorphic rocks crop out at the surface; gneiss, mica-schist, syenite are the most predominating, while the general formation at the Richmond basin is quartzite. Porphyry, feldspar and chlorite in some places figure conspicuously, through which the Richmond vein passes in an easterly and westerly course, through rocks that were contormable to the silurian, thus accounting for the chlorides, bromides and iodides of silver produced by infiltration and decomposition (pseudomorphism) of the primitive minerals in these veins, such as brittle sulphuret of silver and argentite. At the same time the foothills within a mile are composed of limestone, conglomerates and crystallized sandstone, with occasionally some beds of shales of the primordial period. The conglomerates contain pebbles and boulders of quartz and jasper very firmly cemented, of various sizes (some over nine inches in diameter), which undoubtedly are derived in part from the subjacent azoic, and thus show their later origin.

The Richmond Vein

Is traceable for many miles. The first extension east has a shaft which is 25 feet deep, at which point the vein is over six feet wide, showing good mineral ore from the grass roots down, and improving as depth is obtained. Over 10 to 15 tons of ore are piled up close to the shaft (which was taken out of said shaft) that will average from 300 to 500 oz. of silver per ton, while the first-class, if sorted, would be very rich, as has been proved by a few sacks taken from the same, that run over 2,000 oz. Specimens from the Richmond, at the surface croppings and bottom of shaft, are in package No. 5. The ores from this portion of the district can be successfully treated by the chloridizing process, as the amount of base metal is very small.

On the Richmond flat, below the vein a few hundred feet off, is what is known as the Hoo-Doo

Placer Silver Mining Claim,

From which a few tons of silver nuggets have been taken out by stripping the surface ground to the bedrock where the ore is principally found, and in many instances where large deposits of float ore have remained (in statu quo) while the stratum was inundated in salt water, the sulphuret (stephanite) and silver glance has partially decomposed and produced the chloride of silver, not only in the float ore, but has, in many instances, penetrated the seams of the bedrock on which the nuggets have reposed undoubtedly for millions of years. I affirm that if the crystals of the float ore were placed under the microscope and examined by a crystallographer, they would be identified with those of the ore the Helen and Richmond veins contain.

Many scientific (so-called) miners, prospectors and millmen from California, Nevada and other parts, have pronounced the veins of this district surface coyote holes, and have affirmed that the formation is not here to produce true fissure veins. At the same time there was not one among them (that have made the above referred-to assertions) that knew crystallized chloride silver, while in many instances they picked up specimens of bromide and iodide of silver, containing over 30 per cent. of silver, and threw them away as worthless. In their ignorance they classified it as oxide of iron and chromate. I am but a despised pioneer, yet I challenge the accuracy of any man's statement who says that Globe mining district does not contain champion lodes. I have traced many of them upwards of eight miles. Of course where the heaves have been great, the veins are capped over. Notwithstanding this great disadvantage of horizontal strata the veins are so strong as to produce "iron hat" in many places along their courses in a northerly and southwesterly direction. About four miles southwesterly from the Richmond basin the syenite and gneiss again crop out at the surface, in which we have the Blue Bird vein. It is from three to four feet wide, running northeast and southwest, with a dip of 10 deg. from the perpendicular to the northwest. Said vein is traceable at the surface for several locations; it is opened out by a cut about 18 feet deep, and at two points northeast, showing good ore. The specimen forwarded, exhibit No. 6, was taken from a nine-inch streak of ore at the bottom of the cut, 18 feet from the surface. I judge it to be over 2,000 ounces of silver per ton.

There are

Many Other Good Mines

In this vicinity, as the Conquest, (see croppings of quartz and silver glance herewith forwarded and marked No. 7).

The Rhambo, Rescue and several other veins are very familiar to many California men, as they are owned by them. They have already spoken for themselves (the veins) through the rich mineral produced from them. I desire to be understood, that I do not classify any deposit of mineral in limestone as a true fissure; nothing beyond what I have examined is classified herein.

The history of all fissure veins proves that wherever large bodies of rich ore have been found they are certain to recur. I do not hesitate in remarking, as I've proved it by practical experience, that "large, true fissure vein lodes never die out; they are great main arteries of the earth, and are unfathomable by human agency. I know of mines in Mexico (the Veta Madre is worked continuously along its course over ten miles) that have been worked for centuries and are now several thousand feet deep; yet still the lode is going down, even more regularly than when within 500 feet of the surface.

According to Humboldt, a poor Spaniard selected a location upon this great vein or lode, which, up to that time, had remained unprospected. It is now known as the celebrated "Valenciana." After working for a long, long time with no returns, suffering from want and financial embarrassments, like many miners in this district, he came upon a large body of very rich silver ore, from which, from January, 1787, to June, 1791, a period of four years, nearly $15,000,000 were taken out by this poor, half-starved miner; and from being one of the poorest, he came to be one of the richest men in the world at that time. The whole vein, since its discovery, has yielded the fabulous sum of about $800,000,000.

This illustrates the certain

Success of Patience and Perseverance

In the working of mines; and as evidencing the richness of the mineral yield of this region. But a very small portion, however, of this great mineral belt of Globe mining district has yet been explored and prospected for its hidden treasures, and not one vein in 100 is occupied, or has any known owner; while of the mines opened, but few have been more than partially or superficially worked. This latter obstruction is caused by the miners having no market for their ores, and no reduction works in the district. The ores here are all amalgamatiog; there is not sufficient galena in the whole district to smelt one ton of ore per month; while I've lately seen 17 pounds of well squeezed dry amalgam produced by hand in a gold pan and camp-kettle from 20 pounds of bromo-iodides of silver ore. Specimens of several pounds weight of such ore can be seen at camp.

With such showings as the above, who shall say that the fissure veins of Globe mining district are second to any on the continent; and who shall say there are not any number of such mines with which to reward the persevering miner and prudent capitalist? But I advise all, come from whatever part of civilization they may, to bring their provisions and mining supplies with them, for we have a benevolent class of (so called) merchants within 100 miles of this camp, some of whom, at Florence, refused to sell flux to a Mexican smelter (who tendered money in hand) because he was going to use it in Globe mining district to smelt the silver which would not go to Florence. Small towns are capable of holding mighty small people, who are not worthy of the name of men. Such are the supporters of Globe district. They follow the example of their fit companions while swimming across a river—cutting their own throats. What animal does it?

We are indebted to the courtesy of a merchant at Gold City and Pinal creek, for several necessities he furnishes the miners with: Flour, $15 per 100 pounds; (frijoles) beans, $15 per 100 pounds; sugar, 50 cents per pound; coffee, 50 cents per pound; bacon, 50 cents per pound, and several other articles as cheap in proportion. These facts demand the attention of the capitalist, and afford him ample food for calm, deliberate reflection.

"Scientific men, so called, have made stupendous

Mistakes of Judgment,

But they have been surpassed by the mistakes of practical men, so called." The scientific man without practice, and the practical man without science, the honest man without the means and the smart man without honesty have done so much to destroy the mining interests of Globe mining district that the mere fact of its continued existence after such terrible proofs, is proof of its inherent vitality and future prosperity.

The writer has resided several years in Georgetown, Clear Creek county, Colorado, at which place there is competition among ore purchasers; the majority ship the ore to Swansea and Germany. They ship ore as low grade, as 300 ounces per ton; they pay a schedule price per ounce and ship the ors at their own risk. I see no reason why capitalists cannot do the same in Globe mining district. Where the ores are so rich they could ship from this point to San Francisco and get returns as soon or sooner than the former could to England. This would help the miners to develop their property until reduction could be established in the district.

While in Georgetown, Colorado, one day, a miner was seen with a fishing rod and line in hand. The fish-hook was baited with a three cent silver coin. He was jingling it against a justice of the peace's window (whose name was Fish). The 'squire asked him what he was doing. The miner said he was fishing for his (Fish's) soul and thought there was a good chance to catch it with the bait that was on the hook. If some miner of Globe district would try the same experiment on that whale-fish at Florence, who gobbles up all the little sardines that go near him seeking fluxes to smelt silver ores in Globe district, the probabilities are that with similar bait he might be successful.

The 17 pounds of amalgam from 20 pounds of ore heretofore alluded to were retorted to day in my presence, and produced the satisfactory results of $12,000 per ton, estimating silver at $1.18 per ounce. The ore was produced from a cross-course lode in the vicinity of the Sherman, and is owned by Messrs. Griffin & Webb, who worked the 20 pounds of ore referred to. They crushed the ore on a rock with another rock for muller and amalgamated it with the results as heretofore stated as an experiment.

The great success of those who have gone before is still inviting others to follow. An amount of money may here find the most profitable investment, without the prospect of failure.

DESPISED PIONEER.

THE Suisun *Republican* says: It is stated that 100 men can find steady employment by applying to the different stone quarries in Green Valley. If they know anything about quarrying rock they will receive good wages.

THE Sleeper quartz mine, situated at Coon Creek, Baker county, has ceased work. The last clean-up was a failure. This is very disastrous to the mining interests of eastern Oregon.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

SWISS M. CO.—August 25th. Location: Nye Co., Nev. Capital, $500,000. Directors—Bart Groce, Vincent Guscetti, Ambrogio Granini, Louis Twig and Joseph Twig.

CALIFORNIA PAINT CO.—Aug. 25. Object, to manufacture the Averill mixed paint, etc. Capital, $2,000,000. Directors—M. C. Jewell, George F. Belden, O. S. Prick, Tyler Beach and W. P. Bullard.

IDAHO M. & SMELTING CO.—Aug. 29. Location: Soda Mountain, Idaho. Capital, $10,000,000. Directors—P. Hotaling, S. Reinhart, M. Skelly, A. Bocqueraz and N. Dupern.

DELHI M. CO.—Aug. 30. Location: Mariposa Co., Cal. Capital, $5,000,000. Directors—J. Weightman, J. Rockwell, J. P. Mosher and A. H. Yeazell.

MADRAS M. CO.—Aug. 30. Location: Mariposa Co., Cal. Capital, $5,000,000. Directors—J. Weightman, W. Rockwell, E. B. Rogers and J. P. Mosher.

HARD ON THE PUBLISHERS.—Some of our subscribers when called upon by our agents insist that they have sent us notices through (perhaps) a neighbor, postmaster, or a letter, and we have taken no notice their orders, for which they feel hard towards us. Now, we never received such notices without responding to them. *It would be suicidal to our interest to ignore them.* The fact is that it too frequently happens that people misdirect their letters; too frequently forget to put the right (or any other) kind of stamps on their letters; they too often send a copy of the paper to a which may never reach our business office, or if it does reach us, may lack the name of the town and county in which the subscriber lives, in which case we cannot (if we have his name) tell what part of our list to send it, to cross it off or change it, without looking over some 10,000 names. Postmasters and their clerks make omissions and mistakes as well. ☞ When you have business with this office remember postal cards and letter stamps are cheap, and ask no one to do for you which you can well do yourself.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING AUGUST 22D, 1876.

SHARPENING MACHINES.—James O. McLaren and Charles B. Coventry, S. F.

PROCESS ROASTING, SMELTING AND CALCINING ORES.—James Duffy, S. F.

RETORTS FOR DISTILLING MERCURY ORES.—Frederick Gutzkow, S. F.

MINERS' CANDLESTICKS.—Dennis Quinlevin and Robert N. Linebarger, Ukiah, Cal.

SOLDER CUTTING MACHINES.—Ferdinand C. Smith and Charles E. Smith, Portland, Oregon.

STEAM MOVED VALVES FOR ENGINES.—Andrew J. Stevens, Sacramento, Cal.

METHOD OF FORMING EMBANKMENTS.—George Swift and William T. O'Neale, S. F.

TUYERES.—Isaac S. Van Winkle, S. F.

MACHINES FOR REGRIVING AND DRYING SHEETS FROM PRINTING PRESSES.—John D. Yost. S. F.

GAS APPARATUS.—Richard Dean, Virginia City, Nev.

LASTING APPARATUS FOR BOOTS AND SHOES.—David Morey, Watsonville, Cal.

WATER WHEELS.—William H. Rector and Henry C. Black, Santa Rosa, Cal.

LEATHER TAPERING MACHINES.—John Settle of Lebanon and George W Settle, Oakland, Oregon.

SOLDERING FURNACES.—Ferdinand C. Smith and Charles E. Smith, Portland, Oregon.

PUMP VALVES.—Charlotte Thomas, Secramento, Cal., Executrix of William H. Thomas, deceased.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

THE chances of the Sultan's recovery diminish daily. The ministers are seriously considering the question of an approaching change in the succession. The eventual successor, Abdul Hamed, has put himself indirectly in communication with the powers, notably Austria, for the purpose of preparing the way for a general understanding on the pending questions.

AMONG the most agreeable and gratifying qualities of OLENN'S SULPHUR SOAP are those which characterize it as an article of the toilet. It softens and smooths the skin, clears it of pimples and discolorations, and makes it look and feel natural. Sold everywhere.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

And in accordance with law, and an order of the Board of Directors, made on the seventh day of July, 1876, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the company's office, on Friday, the eighth day of September, 1876, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. M. MORGAN, Secretary.

Office, 207 Sansome street (third floor), San Francisco, Cal.

Cincinnati Gold and Silver Mining Co.—

Principal place of business, San Francisco, Cal. Location of works, Kelsey Mining District, El Dorado Co., Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of August, 1876, an assessment, No. 6, of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 535 California street, San Francisco, Cal

Any stock upon which this assessment shall remain unpaid on the 29th day of September, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 16th day of October, 1876, to pay the delinquent assesament, together with costs of advertising and expenses of sale.

WM. SMALL, Secretery.

Office, Room 2½, No. 535 California street, San Francisco, Cal.

Mariposa Land and Mining Company

of Californie. Location of principal place of business, San Francisco, Cal. Location of works, Mariposa County, Cal.

And in accordance with law, and an order of the Board of Directors, made on the sixth day of July, 1876, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, room 33, Nevada block, 309 Montgomery street, San Francisco, California, on Saturday, the second day of September, 1870, at the hour of one o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

LEANDER LEAVITT, Secretary.

Office, Room 33, Nevada block, 309 Montgomery street, San Francisco, Cal.

Mariposa South Mining Company—Loca-

tion of principal place of business, San Francisco, Cal. Location of works, Spanish Belt Mining District, Nye county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the eighth day of August, 1876, an assessment, No. 1, of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of September, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the seventeenth (17) day of October, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. CLARK, Secretary.

Office, Room No. 2, 418 California street, San Francisco, Californoia.

Northerly Five Cent Hill Gravel Mining

Company. Location of principal place of business, San Francisco, Cal. Location of works, El Dorado Co., Cal.

Notice is hereby given, that at a meeting of the Directors, held on the ninth day of August, 1876, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately, to the Secretary, at the office of the company, room 33, Merchants' Exchange, California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on Monday, the 11th day of September, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 28th day of September, 1876, to pay the delinquent assessment, together with costs of advertising and expensea of sale. WARREN BRYANT, Secretary,

Room 33, Merchants' Exchange, San Francisco, Cal.

Sierra Iron Company—Location of prin-

cipal place of business, San Francisco, Cal. Location of works, Sierra and Plumas counties, Cal.

Notice is hereby given, that at a meeting of the Trustees of said company, held on the 18th day of August, 1876, an assessment of $1 per share was levied upon the capital stock of the corporation, payable immediately, in gold coin of the United States, to the Secretary, at the office of the company.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 26th day of October, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CALEB T. FAY, Secretary.

Office, No. 9 Halleck Block, 318 Sansome street, San Francisco, Cal.

Machinery.

The Ingersoll Rock-Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

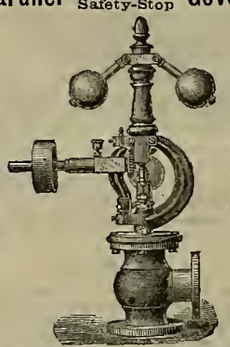
Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and HAS AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

426 California Street

The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE. EVERY ONE WARRANTED.



SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

☞ When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for Pacific States,

Cor. Market & Fremont Sts., S. F.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

DEETKEN'S

ROASTING FURNACE,

For Gold, Silver and Copper Ores.

The roasting capacity of the Furnace, per 24 hours, is from 6 to 50 tons, according to percentage and nature of the sulphureted ore, with an expenditure of one and a half to two cords of wood, and two to three shifts of unskilled labor, according to amount of ore handled. The Furnace is adapted for chloridizing, as well as oxidizing, roasting, and for the manufacture of sulphuric acid. In point of cheapness of construction and efficiency in working, the Furnace is far the best in use. Millmen in need of a cheap and efficient Roasting Apparatus will apply to

G. F. DEETKEN,

Consulting Metallurgist, Grass Valley, Cal,

Furnace can be seen on application for permit, at Grass Valley.

LATEST IMPROVEMENT.

Excelsior Scroll Saw.

Double Treadle, including one dozen Saws, 30 inimitable Fret Saw ing Patterns and Prepared Wood to the value of $4. A new device for tightening Saw, Power Drilling attachment, Wrench, Oil Cup and Driver. Speed, 800 strokes per minute. Saws 1½ in. thick. Price, complete, cased and delivered on board cars or at Express office, $12.

SMALL STEAM ENGINES,

With copper Boiler, to drive light Lathes, Scroll Saws, etc. 100 Scroll Work Designs, free on receipt of Stamp.

Saw only, without attachments, $9.

Patented May 12, 1873.

USE NO OTHER, AND INQUIRE FOR THESE GOODS ONLY.

NOTICE TO PARTIES ORDERING FURNACES.

The mining public is hereby notified that all persons who represent themselves to be my agents or to have authority under my patents to build and use, or to contract with others for the right to build and use a Cylindrical Rotary Roasting Furnace (except in Lander county, Nevada,) are frauds, and any person or persons that constructs one of my furnaces either with or without additions, alterations, or supposed improvements, or attempts to use one constructed under a contract with any such unauthorized person, will be prosecuted as infringers of my rights on the premises. I have made arrangements to have all my furnaces constructed by the Etna foundry, in this city, and no other foundry has a right to make one without my written consent. For rights to build and use, address

GEO. W. WHITE, Patentee, care of Etna Foundry.

San Francisco, Aug. 22d, 1876.

THE NEW NORTH-WEST,

MILLS & KESSLER, - - PUBLISHERS.

Deer Lodge City, Montana.

Terms, $6.00 per annum currency; $3.00 for 6 months.

The above is the only paper published in Deer Lodge County, the largest mineral producing county in Montana; is in the immediate vicinity of the large and productive quartz camps of Butte, Tower, Philipsburg, Travona and others.

The weekly subscription circulation of the NEW NORTH-WEST has not been less than 1,400 in the past two years, and is now larger than ever. It is the best medium for manufacturers of mining machinery and appliances. Fair rates given advertisers. Specimen copies free. Address

The ALLEN ENGINE GOVERNOR.

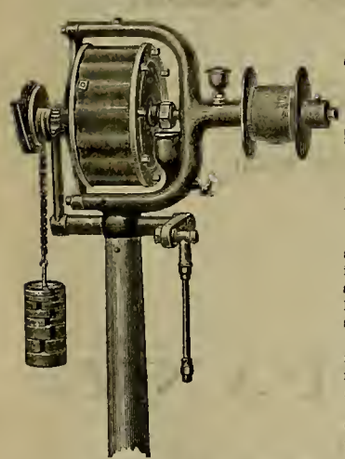

Fig. 1. For Variable Cut-Off Engine.

Uniform Speed in the Working of Steam Engines.

THE SIMPLEST AND MOST EFFICIENT GOVERNOR YET CONSTRUCTED.

ECONOMY and SAFETY.

Especially Valuable with Adjustable Cut-Offs. Capacity of Machinery Increased by Accurate Regulation of Speed.

Direct Saving of Fuel—Great Increase in Power of Engines.

The high rate of speed used acts advantageonsly in making the Allen Governor very sensitive; and all parts being lubricated, it works with the smallest amount of friction.

The speed of the Engine is maintained equally, without reference to the variations in amount of work being done.

The peculiar action of the Governor, which allows the use of a valve of large area, thereby admitting to the Engine cylinder the greatest possible boiler pressure at each stroke of the piston, has produced astonishing results by being attached to old engines, greatly increasing their power or effecting a direct saving of fuel, and in hundreds of instances doing both. In running an engine with the Allen Governor with high or low pressure of steam and with all variations of power, the throttle is opened wide in the morning and remains so until closed at night, thus relieving the engineer from all labor and care except keeping the engine oiled, and giving him a great deal of time for other duties.

Allen's Patent Governor Valve is constructed with a double disc in a tubular frame, and is perfectly balanced, there being no spindle as in the ordinary throttle valve to interfere with its equilibrium. The valve is moved by means of a lever, and is opened and closed by a rocking motion of a steel spindle, which is covered with brass, insuring the greatest possible durability.

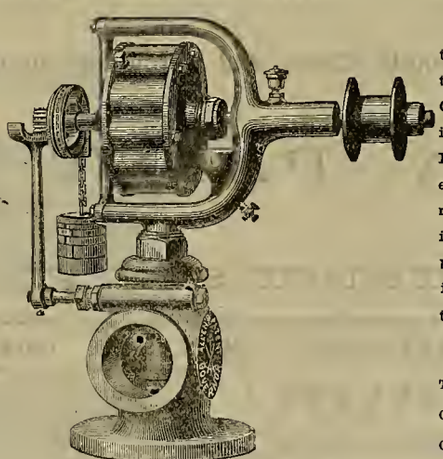

Fig. 2. Allen Governor and Valve.

We have Numerous testimonials from parties who have used this Governor, and watched its workings critically. In all cases the Governor has made the various engines to which it has been applied produce the most profitable results ever obtained.

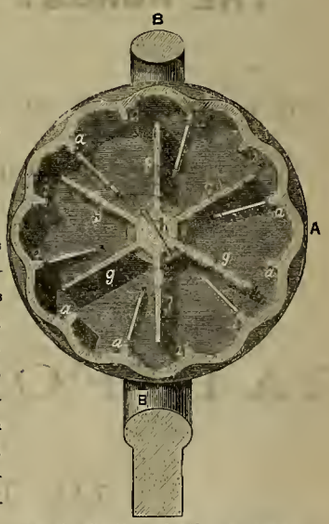

Fig. 3. Section of Allen Governor.

PARTIES INTERESTED IN STEAM MACHINERY SHOULD EXAMINE THE ALLEN GOVERNOR, WHICH IS NOW INTRODUCED ON THIS COAST FOR THE FIRST TIME. FULL INFORMATION CONCERNING IT CAN BE OBTAINED FROM ILLUSTRATED DESCRIPTIVE CIRCULARS WHICH WILL BE SENT ON APPLICATION. Address,

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, SEPTEMBER 9, 1876.

VOLUME XXXIII. Number 11.

Levake's Improved Car Wheel.

Many attempts have hesn made at various timss to improve car wheels and sxles so as to permit ths train to pass cnrves in the road with more ssss and a lsss friction than is the case with the system in vogus. With whssls rigidly fixed to the axles so that thsy must nscessarily tnrn with exsctly the same velocity, there is great friction when rounding a curve, as in that case of conrse the outsids wheel has to travsl over more ground than ths inner one in ths sams space of time. This occasions ths groaning and screeching noise made y a train in rounding a curve. Sinos the wheels are fixed to ths axle, ons can go no fsster than the other snd must slide or slip along the track. As befors stated, msny sttsmpts have besn mads to rsmedy this objection. Most of these have been tried with one loose wheel arranged in some manner, bnt when one wheel ie mounted upon a sleeve which turne npon the axle or when thie wheel is divided and it is attempted to unite the parts by flangee or bolts, they are not safe. The axle has been made in two piecee with a sleeve passing over thie, but theee, with many other devicee of similar character, have hesn discardedby railroad men ae too complicated, extensive or nnsafe.

A devico which bide fair to remedy the defect, however, has heen patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Aneon S. Levake of 2517 Bueh etreet, thie city, and an engraving descriptive of this improvement is herewith given. The invention coneiets in a novel method of nniting the two parts of a divided car wheel so that the inner and outer parts shall be firmly held together while sufficient motion ie allowed between them to allow them to accommodate themselves to cnrves.

By reference to the cuts, the details of the construction of these wheels may be seen. Figure 1 is a complete wheel, and figure 2 is a section. On the axle of a pair of wheels the rigid wheel is pnt on tight at one end and the inner part *B*, of the other wheel also made tight at the opposite end. The outside of the rim *A*, of this wheel fite closely to the part *B*, but sufficiently easy to allow it to move upon the inner part when the strain of turning a curve is brought upon it.

One or more groovee are made in the meeting facee of the outer and inner part of the wheel. The groove e in the outside part of tbe wheel is made twice tbe depth of the groove in the inner part. A ring, *C*, of eteel or iron is made that will exactly fit the groove on the outer part of the wheel, when forced In with clamps. The inner part of the wheel ie then pushed in far enough to hold tbe ring in its place, when the clamps are taken off and the inner part pushed through to its place; then the ring will spring into the groove of the innér part of the wheel, thereby letting the center of the ring come where the faces of each meet. The ring has grooves cut on each side of it so that Babbitt hrase or any running metal can be run in to fill np the space each eide of tbe ring, thereby decreasing the friction. The place where the parte come together are protected by a flange, *D*, on each eide, which may be cast on to each part. Thie will also gnard against any lateral motion and serve to keep out dust or dirt.

In ordinary running the whole wheel turns ae one piece, and it is only when turning a curve that the outer part revolvee faster than the inner, on account of the increased friction. A model of thie wheel ie now on exhibition at he fair.

THE last mile of track between San Francisco and Los Angeles was completed Tuesday last. A golden epike wae driven with appropriate ceremonies.

THE Chinese government is to have a mint of ite own, and fnll plans for mint operations and coinage have been submitted by the Minister of the United States.

LADIES of the Jewish congregations are raising subscriptione for a new Hebrew orphan asylum, in consequence of a necessity for enlarging the present establishment.

A Successful Home Industry.

Manufacture of Brass Goods and Pumps by W. T. Garratt.

Probably the handsomest display at the Mechanics' fair, withont sxception, of Csliforsia made goods, is ths exhibit of brass ware, pumps, etc., mads hy W. T. Garratt. An elegant large show case against the wall is filled with tsstefully arranged articles, brilliant with their new polish. On the floor in front ars arrangsd the heavier articles msnnfactured, includiug laige bells, valves, nozzlss and pipes, ingot copper, Bsbbitt and Garratt mstal, etc A lsrge line of Hooker pumps is also exhibited, some ten of them of different sizss being at work pnmping watsr. In this sxhibit is an almost sndlsss variety of articles made of brass, such as church and steamboat bells, gongs, stesm whistles, stsam gsugss, indicators, lubricators, low water detectors for steam boilere, eteam cocks and valvee, hydraulic nozzles and pipss, faucets, and in fact all sorts of articles such ae are usually made of brass.

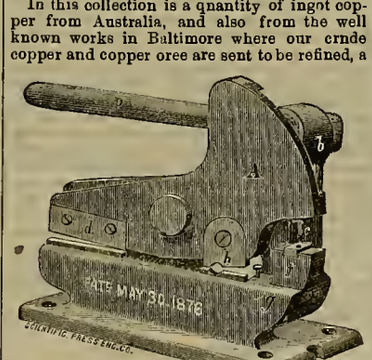
In this collection is a qnantity of ingot copper from Australia, and also from the well known works in Baltimore where our crnde copper and copper oree are sent to be refined, a large portion of which finds its way back to thie establishment for the menufacture of the articles above enumerated. In the same case with the hurnished braes goode are three small bars of refined copper for the alloying of gold and silver, and aleo one square plate of Japanese copper. This latter piece differe entirely in color from the ordinary commercial article, being of a bright scarlet in some places and running into a dark bronze, the former predominating. The bright peculiar color is obtained by a chemical procees which the Japanese have kept as a secret for yeare. However, Mr. John Feix, an attaché of the U. S. branch mint in this city, who ie a refiner of copper for alloying, hae eucceeded in discovering thie procees, or at leaet producee an exactly eimilar color in hie copper.

A prominent feature in thie display is ths collection of Hooker pumps, manufactured by W. T. Garratt. Six of theee pumps in ordinary working drees, ae turned out at the factory, are kept husy throwing streams varying with their capacity. Thsy are calcnlated to throw, the smallest 2,000 gallons, and the largsst 20,000 gallons, per hour. Nssr by thess are four handsomely finished pumps of similar pattsrn, with nicksl-plsted bright work and nozzles, sll in sctivs operation. Bsck of them is a collection of thsse pumps of all sizes, from the littls boiler fssder up, just as they come trom ths shop. These pumps are in use all ovsr this coast, and are so wsll known as to nesd no special description. The working parts are covered and protected, they occupy smsll spscs, will run vsry fast or very slow, and in fsct, their rsputation is snch thst they need no spscial commendation from us. They have bsen tried at sll kinds of work, mining and evsrything elss, and practical experienes over a psriod of years has established thsir superiority.

These pumps are mannfactured at Mr. Garratt's establishment in all sizss and for all kinds of work. He has one large room devoted exclusively to their manufactnre, with all the most approved mechanical appliancee for doing good and rapid work, Dnring a visit there thie week, we saw the first trial of an immense Hooker pump for the Santa Cruz water works. Thie is the lsrgest ever made here, having an 18-inch steam cylinder, 10-inch water cylinder, with 24-inch stroke, tbrowing about eight gallons of water at a stroke. It is to raise water 200 feet, to a reeervoir to supply the city of Santa Cruz. Another large pump is slso being mede there. This ie of tbe same size except that the water cylinder is twelve inches; it is for a mining company. Besides the mining pumps, this establishment manufacture tank pnmps for irrigating, deepwell pumps, double acting euction and force pnmps, and a large number ot others.

Mr. Garratt'e establishment is quite extensive, and is situated in a large three-story brick bnilding on the corner of Fremont and Natoma streets. Not only brass but iron work is done here, all the different parte of the pumps being made in the building. The toole nsed are of the most approved character, and about a hundred men are conetantly employed in the different departments. It wonld be difficult to enumerate all the articles mannfactured, so great ie their vsriety and style, but anything in the brase line can be made there, from a cannon or church bell to the simplest article desired. Hon. W. T. Garratt's connection with manufacturing enterprises en this coaet datee back as far ae 1850, and although during his business career he hae euffered heavily from fire three timee, these reverses did not prevent his carrying on his establishment to its preeent succeesful etandpoint. It is now the largest one of ite kind on thie coast and doing an extensive business in all directions. A single glimpse at the variety of goods displayed at the Pavilion will give an idea of the extent of manufacture, although only a emall portion of the varieties made are exhibited.

Levake's Improved Car Wheel, with Section of Car Wheel for Turning Curves.



VanWinkle's Metal Punch and Cutter.

THE indiscriminate scattering of poisoned grain, to kill squirrels, is resulting in the death of immense numbers of quail and other birds in eeveral eections of the State. May not the remedy be worse than the diseaee?

THE Pennsylvania coal companies have reduced the wages of employeee 10 per cent., and the workmen accept it.

An Improved Machine for Punching and Cutting Metals.

We illustrate on this page an improved machine for pnnching and cntting mstals, recently patentsd through the MINING AND SCIENTIFIC PRESS Patsnt Agency, by Issac S. Van Winkle, of 412 Market strset, in this city. The arrangement of punch and cutters in this machine necsssitates a somewhat psculisr conformation of frame work or snpport—tbat shown in the prssent instance being excsedingly simple, viz: the part *b*, affords a bearing for the shaft of the cam movement and for the swinging head, *A*, and also serves as a guide for the ssme. The extension or block, *f*, has a bsd for the punch *c*, and upon the part *g* are the lower knives or jaws, *d*, of the cutter, of which the end cutsr is designed for cntting sheet metal, and the cutter, *h*, for rods or bars.

The swinging hsad piece, *A*, is preferably receesed for tbe reception of the several operative parte of the cam movement, which consists of an involute or heart-shsped cam, secured npon the shaft and provided with cogs which gear with corresponding teeth npon the eegmental cam gesre pivoted to the ewinging head piece. The coge arranged upon each of these cam shaped snrfaces are in width equal to about one-balf the width of said enrfaces, and of such depth that all pressure comes entirely upon the smooth bearing surfaces of the several cams, and the gearing eerves for traveling purpoees only. The cam segments are arranged to gear with the heart-ehaped cam gear, so ae to travel in opposite directione dnring the movement of said cam, wherehy the pnnch and cutter may be alternately operated at pleasure. The shaft, *a*, hae a square or snitably ehaped end for engaging with an independent weigbted handle, *p*. This handle hae conaiderable weight for the following important purposes: It being desired to operate the punch by a single operator and in casee where considerable force ie required, the handle is fitted on the shaft in an elevated position and by reason of ite weight can be easily depressed and the punch brought down upon the metal.

If it is now desired to raise the punch and close the cutting jaws, the bandle ie taken off and again fitted on to the shaft in a reverse position corresponding to the one aseumed in order to depress the punch.

It will be observed that in the operation of the machine the line of preeenre in the cam movement is on a right line between the axial bearinge of the eegmental cam, by reason of which the shaft may be made of minimum size if desired. Also the preesure being npon plain bearing eurfaces, the cogs are not liable to he hroken. The featnre of tbe handle heing made adjustable for greater power, either made as ebown or with a sleeve eockct npon the cam, and the punch, which may be placed nearer the fnlcrum for heavier work, render the device universal in its application.

GLOBE DISTRICT.—Since the pnblication of the description of Globe district, Arizona, in our last issue, we have additional information of interest from that locality. The two wagon loade of ore shipped to Silver City, N. M., from the northeast part of the district, prodnced such satisfactory results that several parties have come into the district from that place. Williamson'e lot of ore worked $3,986 per ton. Mr. Breman of Silver City visited the district with the view of putting np a stamp mill at the forks of the creek, a little above the junction where the "Blue Bird" intersecte Pinal. The mill ie at Silver City all ready to ehip. He also intende to put up a saw mill in the Pinal mountains at the same time. The mill wae expected on the ground on the 1st inst., and will be running in 60 days. A rich firm from Santa Fe will accompany Mr. Breman with abundant snpplies for the camp. Our informant seems to think that Eastern men have more nerve and enterprise than San Francisco capitalists who have made their money by mining. Globe dietrict is next door neighhor to San Francisco, yet ite rich silver oree and bullion will eoon pass throngh the hands of Eastern men, and the snpplies also. The charges for milling ore at the new mill are expected to bs about $50 per ton.

CORRESPONDENCE.

Mines of Humboldt and Lander Counties, Nevada.

The further one travels in this State the more deeply is hs impressed with its immeuse minersl wesith. If it did not requirs s fortune to turn it into bnllion, the country would soon be so flooded with the precious metals as to render them almost valueless. It will be regnlated by the law of supply and demaud. The greater the cost of prodnction, the less will he extracted. Depreciation in value from an overaupply will have the same effect, or drive the miner to greater economy, or to the invention of cheaper processes. There is no effect without an adequate cause. For reasons best known to the owners, there are a large number of mines found in almost every district, although considered valuable, whioh now lie idle, with merely sufficient work done from time to time to hold them. Some of them have many of the base metals to contend with, the ores being too rebellious to be profitably reduced by the ordinary processes, and the inquiry comes up on every hand: "What has become of the Fryer procesa? Is it a success? Will it work on a large scale?"

Some have asked for information who had had small lots of ore worked to their satisfaction at Grass Valley. These and other anxious inquiries have been relnctsnntly turned away from want of personal knowledge, or any reliable accounts from other sources. If the MINING AND SCIENTIFIO PRESS hsa answered these questions in its editorial columns, it has been overlooked.

Some account of mines of Humboldt county is now resumed. There is a very large ledge of

Argentiferous Galena,

Situated in Eden Valley district, 500 miles from San Francisco, and 25 miles north of Golconda, a station on the C. P. R. R., ou which two locations have heen made, and tested by working process to tne satisfaction of Mr. M. Meader, the principal owner. The vein matter is said to be not less thau 200 feet in width, and easily mined. Ten tons worked at the Humholdt reduction works yielded $38.50 per ton, smsller lots working up to $86, with assays as high as $400. A mill will probably be erected and the ores concentrated and shipped.

The Golconda,

Owned by a New York company, is at present not runniug, although represented as having turned out in the course of two or three years about $100,000. It lies about ten miles south of tne station and on a ledge that can be traced for many miles.

The Golden Eagle, on the same range, has a large ledge, mostly of a rather low grade ore, running from $40 to $80 per ton, and represented to be well thought of by experts.

The Bona Fide company, in the same vicinity, have a three-foot ledge, the ore at the bottom of the shaft giving assays as high as $400 per ton—ore somewhat refractory, needing both mill and furnace. At the south end of this range, 18 miles from Golconda, there are three mines at this time in operation. The ledges are narrow, but contain some very rich ore. The

Agnew & Sterling

Mine averages ouly from eight to ten iuches of good paying ore. With a little assorting it yields about $500 per ton in silver. It is a sulphuret ore that can be milled, aud it is geuerally believed that it pays very good wages. Mr. Picard, on the same ledge, is reported as doing equally well, while his neighbor had done but little the past year owing to loss of pay streaks, after having realized withiu the last few years from $40,000 to $50,000 from the mines.

Some of the

Mines of Lander County

Will next receive attention.

Finding, on arriving at Battle Mountain station, that the Lewis mines were 15 miles away, and no direct communication by public conveyance, on an invitation from Mr. A. Robertson, the accommodating agent of the stage line of Tuller & Clogage, (who, by the way, put passengers through in qnick time and in easy going coaches from this point to Belmont), five minutes' time fonnd us on the road behind a fast team, thoroughly enjoying the trip, the details of which, however pleasant to remember or interesting to recount, might not be very appropriate for a dignified journal such as yours, treating mostly of facts relating to mines, mechanics and science. So let us plunge with the old historians *in medias res*, snd resume the thread of our narrative without further preliminary.

The fine ten-stamp mill of

The Eagle Mining Company

Was soon reached, as slso the mines a short distance above, to find, to our disappointment, that both had recently been shut down. A large body of water had been encountered, and there was a rumor afloat that the superintendent was in your city for the purpose of making arrangements to pnt on the necessary pnmping machinery to handle the water. However this may be, judging from its standing in the vicinity and from soms fscts given below, it csnnot long lis idls.

There is a two and a halt foot vsin of antimonisl silver ors, snd from ststemsnts desmed wholly reliable, some of ths first class worked up to $600 per ton, second class to $223, and unssorted, or just ss it came from ths ledge, from $110 to $136. Unless thsrs sre serious drawbscks (and nons were observed or heard of) such s prospect wonld be considered flsttering in any district.

The Henry Logan,

Further south on the same hslt, had recently passed into the hands of Mr. A. M. Stsrr, of San Francisco. When visited there was a full force of men at work making further developments or taking out ore for reductiou at Winnemncca. The ledge in places was from four to eight feet in width. Being near the surface, portions were somewhat broken up, or barren. Different bodies of ore were pointed out by Mr. Groves, the superintendent, tbat would work from $40 to $100 per ton. Ten tons from one point had yielded as high as $182, and the highest assay heard of reached $3,600 and upward. The Defiance No. 2, an extension in the same belt and locatsd between the Eagle and the Henry Logan, had been opened by a tnnnel 200 feet in length, finding some rich ore, hut not in quantity to pay for extracting; assays reported ss high ss $2,000. Depth is required, as in all the mines of the district, before its value can be determined.

Since last writing some additional facts were obtained in regard to the Jersey. It has been leased to J. B. Meader, of Salt Lake; 26 men are employed; about 70 tons of concentrated ore shipped to Omaha per month. Shaft now down 200 feet, where a good body of ore is said to have been struck. A new whim is being put up for further sinking, the debts are being paid off and all things promise well for a valuable and permsnent mine.

Some encouraging accounts were brought in to Battle Mountain in reference to the mines of Tuscarora, which must be "boiled down a little" on account of accumulating notes.

The Young America

Had found, on 200-foot level, gold ore milling from $125 to $175 per ton. The first extension north gives sample asssys of $139 in gold; 30 tons of ore on dump first sonth, 60 tons out, assaying abont the same.

The Grand Prize

Had had 30 tons worked that yielded $1,300 per ton, with 100 out and much more mined, valned at $1,000 per ton, besides a large body of rich ore in sight. The Ophir, Navajo and Horuet all had similar ore. Messrs. McDonald and Grayson, of San Francisco, had purchased large interests in mines and other property. It is said that it is their intention sooner or later to erect a 20-stamp mill.

A promising tunnel site had been located by Mr. C. S. Perkins of this place and by Messrs. Brown and Hanoum, of Etko, and there was a more than ordinary interest excited in regard to the recent developmeuts. Further facts will be given, after a personal inspection, I hope some time in the fall.

The White & Shiloh Consolidated M. Co.'s

Mines, at Galena, 13 miles from Battle Mountain station, have average veins from eight to 20 feet, dipping east. Shaft on the White, 200 feet, with preparations now making to put up heavy hoisting works to sink 800 feet deeper, three levels in 200-foot shaft running north and one adit level, little stoping having been done. From these, $400,000 worth of ore have been taken out and shipped, the ore assaying $260 per ton silver and about 25 per cent. lead. The adit level, 600 feet in length, will be extended as much further. The character of ore is galens, gray ores, ruby and wire silver. Shiloh shaft, 160 feet and one level, from which 300 tons have been taken, averaging $100 in silver, with 50 per cent. lead. Have good hoisting works on this shaft. There is also here a complete Krom concentrating mill, with capacity for 50 tons per day, costing $60,000. These mines are looked upon as among the best in this locality, and are owned by Mr. John O. Earl, of San Francisco; Mr. S. W. Knowles, Superintendent.

The Tembey Bros.' Mine,

A late discovery, and worked only two months, has been laid open by shaft 60 feet, showing a good large ledge, 20 feet or more in width, trom which 60 tons of argentiferous galena, all good concentrating ore, have been extracted, with average assays from $150 to $200, with some running much higher.

The Revenue Mine,

Owned solely by Capt. Taylor, of Galena, and better known as the "Way Up," from its location on the summit of a high ridge to the west of the village, bas a shaft on the main ledge. A tunnel has been run that cuts the ledge at a depth of 100 feet, and a shaft sunk 40 feet in the main tnunel, exposing a three-foot vein of good milling ore, running from $60 to $80. The mine has been further prospected by four different levels, all showing the same width of vein and the same promising ore.

The Butle,

Owned by Mr. J. A. Blossom, of Battle Monntain, an old claim that paid the first owners well, is now rnn under lease by Mr. W. A. Goodwin, of Galena, with good prospects so far as tested. He is preparing to concentrate the ores as fast as taken from mine before shipping; is not running on the chlorides, but giving his attentiou to the black sulphurets and argentiferous galeua, and thinks, from his knowlsdge of ths ores in this district, he will sventually be sble to mske it pay. Hs clsaus the ore of all the gsngue, blends or black jack snd iron by means of a cheap mods of concentrstion, first met with here, in order to save freight in shipping.

His method is similsr in some respects to thst of the Copper Canyon mines, which sre opersted by machinery instead of hy hand, and on a much grander scale, and the ssme as that adopted in the

Small Experimental Works

Put up at Galena by Mr. John Rsndohr, with the view of proving to the miners thst he con'd not only work smsll lots of rich ore to great advantage, bnt make use of his screenings at an outlay not to exceed $75, separating about two tons per day with the aid of one man. The principle of this jigging process is both simple and heautiful, in full sccord with the laws of natural science.

By means of a plunger, worked by a lever, the ores are forced upward and held in suspension by the water long enough for the heavier ore to get the start of the lighter in the race, thus forming separate layers, and in the order of their specific gravity.

The Battle Mountain Mining Company.

The mines of this compauy in Copper canyon, three miles south of Galena, have been worked for seven or eight years, producing copper ore of very rich quality in red oxides, greeu and blue carbonates snd oopper glance. There are three main workiog shafts, 113, 135 and 400 feet respectively, and drifts have been extended from 100 to 600 feet, from whioh and the stopes, betweeu 4,000 and 5,000 tons of ore ranging from 17 to 47 per cent. have been extracted and sold, the ore gradnally improving to the lowest levels. At the foot of the 400-foot level a large body of water was struck, in consequence of which the compauy are now contemplating the erection of machinery for hoisting and pumping.

During the last six months there have been erected on Willow creek, two and a half miles west of the mine,

Concentrating Works

Run by wet process and alluded to above, which were so novel, ingenious nnd successful in their operation as to call for a somewhat detailed description. It is only the secoud and third class ores that have heen accumulating at the mines, which are manipulated at the mill. The ores are first passed through one of Blake's rock breakers, aud thence fall between Cornish rolls to be further reduced.

Tbey are now carried by a stream of water into perpendicular sizers, containing four screens with meshes of different sizes, the uppermost and largest three-eighths of an inch square, the secord one-fourth of an inch, the third one-eighth and the smallest one-twelfth, the screenings of each falling into a separate hopper snd thence conveyed to jigs especially adapted for their concentration. The jiga are cubical in form, with three compartments, each two feet square, and are operated by a plunger in tbe center, the stroke of which is regulated hy a slotted crank, and on each side are the sieves of the proper dimensions for the separation of the different sizes of ores. Owing to the fact that these ores contain a large amount of slime, an ingenious method has been resorted to for its separation from the ores which would otherwise render their treatment impossible. All the slime is carried into a small sizer, acted on hy a column of water which throws the finer particles into a tank, afterwards to nndergo a huddling process, and the coarser portions into another tank for the purpose of going through a process called in miners' parlance "tying," whilst the finest slimes are operated upon by a mode of manipulation styled "tossiog," with the view of saving any of the rich ore which may have been very finely pulverized. Capt. Nancarrow, one of tbe directors, who had just returned to Battle Mountain, expressed himself as very highly plessed with the mill and all the appliances for sizing, jiggiug and the treatment of ores, the construction and arrangement of which from mill down to the minntest and most interesting details may be said to he due to the supervision of Capt. Jos. Richards, the Superintendent of mine and works. A. C. K.

Battle Mountain, August 29, 1876.

Facts About Peat.

[Written for the PRESS by SAMUEL PURNELL.—No. 4.]

Prices.

In Paris air dried peat is sold for 20 francs ($3.75) per ton; peat charcoal at 100 francs ($18.75), about the same as wood charcoal. In Dublin peat sold at ten shillings ($2.50) per ton. Tbe price of peat charcoal iu Bavaria was 12 shillings nine pence ($3.18) per ton; at the same time coal was selling at 14 shillings five pence per ton. Iu France, on the Loire, peat is worth two francs and 50 centimes ($0.47) per cubic meter. At Ravenna, Ohio, in 1869, compressed peat was sold at the bog for $4 50 per ton. At Lexington, Connecticut, a few years ago, a limited quantity of peat was sold for $5.00 per ton, but the Pennsylvania anthracite coal soon banished it from the market altogether, although the manufacturer claimed to be able to produce his peat for $2.00 per ton. In Germany it appears that the cost of producing one ton of peat is from $1.50 to $1.75. In England the average cost appears to be about $2.00 per ton for dense or compressed peat. The cost of peat in Causda is reported at six shillings six penos ($1.62), but thsy did not seem to be able to sell it for less thsn $4.00 per ton. The cost of making condsnssd peat in Ireland is reported st $2.00 per ton; in Bohemia about the same. Its cost in California could scarcely fsil to be at least $2.50 per ton? In England a complets plant for prsparing, comprssing and air drying by the Clayton process, (sbout as chesp ss any,) 120 tons of pest psr dsy, at a cost of eight shillings ($2.00) per ton, ia estimated to cost about $100,000, and require the services of 130 persons iu all.

Peat for Locomotives.

There is no question among practicsl men that peat is an excellent fuel for locomotives. There is no troublesome amount of clinker or ash from a good article. It burns with hut little smoke, throws no spsrks and steams easily. As in other cases, the real objections hsve been to the cost; coal has been cheap, and peat could not be produced at a competitive price. In some parts of Europe peat is exclusively used for locomotives, snd on this continent some valuable experiments have been msde in this direction. The results vary greatly, ss various kinds and qualities of peat were used nnder widely varying circumstances, and it was slways in competition with the best English or American coals.

Gold and Silver Mining.

[For the PRESS by ALMARIN B. PAUL.]

It is now somewhat refreshing to see that gold and silver mining is assuming a respectable position among our industries, after the traducing it has had in years past, when a man was regarded as a "visionary" fool to stick to it.

The press, with but few exceptions, descanted on the advantages of agricultureal, mechanical or commercial pursuits as the all-profitable and elevating businesses, in fact, gave good cheer to all but mining—that was to be only taken up when there was nothing else to turn your hand to. The press now begin to talk of it as one of the great pursuits, and some begin to class it in point of legitimacy alongside of merchandizing and manufacturing—yes, farming. The fact is, statistics show that legitimate miuing (not speculative rohhery) exceeds in certainty and percentage of success either of the above businesses. The New York *Herald* even admits "that it gives a better showing than can be made by any other of the great indnstries of our country," and further says: "If we apply the test of $4.00 per day for labor, every other industry would have been proved a total failure." This heing so, why is it not a legitimate nsinsss? We of this coast are prosperous as a mining community, while the Atlantic coast is groaning under her financial pressure and crying for our gold.

New York begins to see the point, and aspires to have a share of the gold and silver wealth of the Far West, and is starting out with fresh ardor and more confidence. She will probably now go in more considerately, and without trembling for every dollar she puts out—cowardly dollars never made a cent out of mines. You must calculate well your work beforehand, then go ahead and do it.

Mining to-day, on this coast, is of more importance, in fact, I may say more certain, than in the past, and from the fact that *now* mining is going down into the bowels of the earth 1,000–2,000 feet, and the extracting of 500 to 1,000 tons of ore every 24 hours. It is getting to be a business. We are getting our heads accustomed to bigger works, bigger machinery, and the putting in of "big" money by consolidating capital. We have learned the business, can master it and can teach the whole world the art of profitable mining.

Instead of two men pounding away at one drill we drive our "heads" with machinery, and do one week's work in 24 hours. Instead of black powder to make a pop-gun shot we nse Giant or Hercules, and dislodge tons.

Instead of the slow tramp of stamps of 30 and 40 drops a minute, we drive them np to 90 and 100. Instead of taking from six to eight honra on every ton of silver ore we manipulate it on the run. Instead of handling a few bars monthly we load wagons. In other words, mining with us is a live, bold business, and it only wants coin, vim, brains and experience to make it profitable. Mining, really, is likely soon to enlist the attention of the people of all the States. And why should it not? We have learned the business. It has a life, a speculation, a vitality about it, well suited to the American character.

We have in the Union a vast idle capital, and we have in California, Nevada, Colorado, Arizona, Montana, Oregon, Idaho and Wyoming mineral fields expansive enough to absorb it all and open a mart for all the unemployed labor of every State To give to mining, as a people, the attention the pursuit merits, in less than a quarter of a century we could deluge the world with the precions metals. In California, Nevada, Colorado, Oregon, Montana, Arizona, Idaho and Wyoming large enough deposits exist to enlist all surplus capital and employ all surplus labor if attention was only given in that direction. The New York board will have a great tendency to create this interest. It only wants proper safeguards to protect capital from swindling harpies, and this should be their first great effort. Make adventures profitable—there is more money in it for everybody. The New York board, as I view it, is going to disappoint some of us; instead of playing second fiddle to San Francisco, she will lead us.

SCIENTIFIC PROGRESS.

A Veritable Salamander.

Our English exchanges describe experiments with a fire-proof suit of clothes which would withstand the "burning fiery" furnace itself. *Iron* tells the story of the experiments in a lively style: Mr. Oersberg, a Swedish mechanician, claims to have invented, and Captain Ahlstrom, a compatriot, to have matured and fitted for practical use, the dress which will enable the wearer to dash with impunity into the fiercest fire for the purpose of saving life or property. At the east end of the palace, between the circus and the banqueting hall, huge piles of old dried wood were heaped up, intersected by narrow avenues, and the wood was drenched with petroleum. The consequence was, that the moment a light was applied to the pyre the whole blazed up with a flame so fierce, and seading forth a heat so intense, that the thousands who had gathered aronnd to witness the scene were forced to retire to a more respectful distance. The sun's rays, which had hitherto been inconveniently felt from above, were quite forgotten in the glow which now flamed up from below, and it really seemed as if there was malice in the tongues of fire that spat ont on every current of passing air. Standing 40 yards to the windward of this fierce fire, the heat was all but intolerable, and even the firemen of the palace brigade, under the command ot Captain Archer, the chief officer, were fain to give a wide berth to the burning center. Then it was that Captain Ahlstrom, clad in a dress aot at all unlike that worn by Captain Boyton when he paddled himself across the Straits of Dover, made his appearance on the scene. His costume consisted, so far as it was possible to ascertain, of an overcoat of fustian, covering an inner garment of wool and felt. Between the two skins—so to say—is a network of veins, through which are pumped continuous supplies of air and water, the main air tube before it reaches the body being enclosed in a large water tube, and by such meane kept perfectly cool. The escape for the cool air is through orifices in front of the face, and the current so made forces back the flames, and leaves perfect breathing space. Assnrance was given that the clothing itself is in no way chemically prepared, and is simply protected against the action ot the flames by the torrents of water that pour over the man from head to foot. With the greatest possible nonchalance Captain Ahlstrom walked into and through the fiery furnace, not only free from discomfort, but apparently with enjoyment. After spending about ten minutes in about the warmest climate it is possible to imagine, enveloped so as at times to be hidden by the flames, he carried out a chair which was on fire, sat coolly down upon it, and, to the amusement and astonishment ot the spectators, smoked a cigar.

A New Nickel Ore.

Nickel, which of late is so much in demand, has been found always in the largest quantities in Sweden and Brazil, the yearly production ot the two countries amountiag to about 250,000 pounds. Germany also produces 50,000 to 80,000 pounds yearly.

Considering the present demand for that metal, this yield ie much too small, especially since Germany has determined to replace her smaller coins ot silver and copper by nickel. Much interest is therefore felt in the report of French travelers, as to a deposit of nickel in New Caledonia (Australasia).

The discoverer ot this new source was the French geologist, Jules Garnier, who traveled through the island on behalf of the Department of the Marine and Colonies, as far back as 1864.

Concerning the samples and report sent in by him, the State geologiet ot New South Wales, the American geologist, Dana, and Protessor Livesidge, of Sydney, have published an article and given the new mineral the name of garnierite.

In it the nickel amounts to 16 per cent., and with other analysee as high as 19 per cent. The eparation of the metal from its ore is much simpler than in the ordinary ore—known as nickel speise.

In 1869, Garnier says, "the serpentine, and in general, all the minerals accompanying it, are covered with a beantiful green coating, which ie a silicate of aluminum, niokel and magnesium. Nickel occurs so frequently in this way in the serpentioe minerals of New Caledonia, that one hopee to find a new source ot thie exhausted metal, which in Belgium is worth 12 francs, ($2.40) tor every kilogramme (about 2½ pounds)."

The kilogramme of nickel solle now not for 12, but 40 francs, eo that it can be easily understood that the French Colooial Ministry has many petitions for the control of the mining of niokel in New Caledonia. Some ot these have been accepted, as we hear of the arrivel in France of the first ship load, some 500 tons, of garnierite.

If the present expectations ure verified, the oonsumption of nickel will increaee, und it will be removed from fluctnations in price, which will be established near to that of silver, whoee place it takee and so much resembles.—*From the Chicagoer Handel-Zeitung.*

Shooting-Stars.

As the period for meteor gaziag is approaching, we take trom an article by Prof. C. A. Young, in the *Journal of Chemistry*, the following paragraphs: "Metsors are very small, for the most part, as Newcombe and Herkness have shown, weighiag certainly not more than a few grains, and possibly only some thousnndths of a grain, mero particles or cloudlete of dust, which are traveling in space nuder the same laws as those whioh govern the motione of the planets and comets, and with u velocity as great; varyiag in different cases from eight or 10 milee per second lo 40. The least velooity named is more than 30 timee that of a cannon ball. When they enconnter our atmosphere this velocity is destroyed hy the resistance, aad, according to well-knowu laws, their energy of motion is converted into heat ot intensity sufficient to render them incandescent, and even to dissipate any solid portions in vapor.

It is the amount of light thoy give which furnishes the evidences as to their minuteness, but it would take too loag to show just how the conclnsion is arrived at.

Their numbers are very great. It is found that one observer will on the averuge see from four to six per hour at any given place, and careful experiment shows that a siagle person sees about one-eighth of all that could he aeen by a sufficient number of observers so placed as to watch minutely every portion of the sky. About 40 per hour is therefore a fair average for one station, or nearly 1,000 each day. If the calculation is carried out for tho whole earth, allowing that at eaoh station all are observed which come within a circle 200 miles in diameter, we fiad that the total nnmber which reach the earth daily is about 5,000,000; indeed, Prof. Newcombe, who is perhaps the highest authority on this subject, sets the number still higher, at 7,500,000. A curious fact is that the hourly numbers inorease from sunset to snarise by some 50 per cent. The reason is simply that in the evening we are, so to speak, behind the earth as it rushes through space, and see only those which overtake us; in the morning, on the other hand, we are in front, and see all we meet, as well as those we overtake.

Of course, it meteors are thus perpetually entering the atmoephere, it is natural to ask, What becomes of them? Do they reach the earth? Probably, as impalpable dust. Nordenskiold, dnring the recent arctio expeditioa, examined with great care quantitiee of snow from regions apparently beyond the reach of all human adulteration, and on meltiug the snow and evaporating the water he always found a residue consisting largely of iron and its oxides. This he considers to be of meteorio origin, and it is not improbable, considering how important a constituent iron is found to be in those larger masses, the aerolites, which from time to time fall upon the earth and are collected into our oabinets.

How Spontaneous Combustion may Occur.—In writing upon this subject *Iron* says that, taking the broadest view of the subject, it may be assumed that spontaneous fires—that is to say, the taking fire of substances by the evolution of heat through the chemical activity ot their own elements, without contact ot the burning objects with flame, spark, or heated combustion products, and without human intervention—may originate as follows: First, by the accidental contact of two or more substances that possess the quality of actiog chemically upon each other. Second, by the slow combustion (eremacausis) of porous substances, such as lampblack, charcoal, powder, coal, and especially masses of wool, tow, cotton or rags when saturated with various oils or grease. Third, by the spontaneous ignition of explosive and other compounds. Spontaneous fires originating from the first cause ure of rare ocourrence, for which reason but little importance attaches to it; nevertheless it is safe to assert that its influence is not adequately appreciated, and that it may reasonsbly be held responsible for many fires of which the origin has been called mysterious. From the nature of the case, it may be inferred that most accidents ot this character are confined to the lecture room or laboratory ot the chemist, or to the workshop of the manufacturer of fireworks and chemicals. A few caeee in point may he given. Spontaneous combnstion of this kind can readily be illustrated hy permitting a drop of strong sulphuric acid to drop upon a mixture ot chlorate of potassa and white sugar, or upon caustic baryta, or a drop ot water on a fresh surtace ot metallic potaseium, or a mixture of etrong nitric and sulphuric acids on turpentine, or hy the contact ot phosphorus and chlorate of potasea, or by the evaporation of a solution of phosphorus in bi-sulphide of carbon or other volatile solvent. In eaoh of these oeses, and many more that could be enumerated, the effect produced is quite striking.

Prize Offered by the Netherlands Scientific Society, Haarlem, 1876.—Prizes are offered tor essaye on the following subjects: (1) Complete experimental etudy of the possibility of decomposing water by a Daniel's cell. (2) The meteorological and magnetioal phenomena which can be shown to be in connection with the solar spote. (3) Mixtures of hydrogen and carbouic oxide being ignited in the eudiometer with a quantity of oxygen insufficieot for complete combustion, there remaine a part ot the two combustible gasee, and the quantities ot water and of carbonic dioxide formed are in the ratio of simple multiples of their molecular weights. Repetition and investigation of these experiments is asked for. (4) The society asks that the researches ot Mr. Lockyer concerning the difference of the spectrul rays of calcium he extended to the other elements. (5) Collection of the experiments relating to the existence of *bacteria* in contagious diseases, with original researches. (6) Constraction of a simple instrument tor measuring temperature ahove 350 degrees C. in degrees of the air thermometer. (7) Investigatioa into the influence which the different colors of the spectrum exert on the lower animals.

MECHANICAL PROGRESS.

Fine Points in Mechanism.

It is pleasing to u mechanio to read to what a point of accuracy work can be brought. At the recent exhibition of mechanism at South Kensington museum, Sir Joseph Whitworth described his method for obtaining a true plane and for accurate measurements. The *Colliery Guardian* describes them as follows: He first described his true planes, as a true plane is the source and foundation of all truth in mechanism. The manner of obtaining true planes is thie:—Three hexagonal steel plates are taken, each planed as true as it can be. One is then rubbed against the other with u thin smearing of ronge and grease over each. The slightest elevations take away the coloring matter, and this indicates where the hand tool is to he worked to cut them down. They are thus tested with one aaother and cut down till a perfectly smooth surface is produced. The object of having three plates is that it two only fitted one might be slightly concave and one convex. Thie cannot be the case with three. Every plate ie now made with three points of snepension instead of two, as with two hendles it has been found that perceptible alterations occur. So true ere the surfacee produced that when one plate was put on another it was seen to glide about as if it were floating, aad when one was dropped on another a "cushion" of air deadened the metallic sound, while when once the air was squeezed out the contact was so close that the lower adhered to the upper when it was raised. Then was shown the workshop measuring machine tor making difference geuges from correct cylindrical stsndards of size. With this, Sir Joseph demonstrated how rapidly it was possible for a workman to make the measurement ot 1-40,000th of an inch. This is of importance in making hearings for sxles of the exact size wanted, since heated axles often occur where the exact size is not obtained. Boxes of standard lengths of end measures and of external and internal standard cylinder gauge were shown. Difference gusges, each varying hy .005 inchee in diameter in the series, enable a workman to feel his way, step hy step, so as to make the bore of any number of barrels or tubes exactly the same diameter. The machine tor measuring to the millionth ot an inch was next explained, and with it Sir Joseph made a measnrement of 1-200,000th of an inch. The millionth he did not attempt, because it needed a temperature ot 62 degs., that being the degree at which it was arranged to work. The screw of this machine has 20 threads to the inch, the screw wheel 200 teeth, and the micrometer wheel is divided into 250, thorefore each division represente the one-millionth of an inch. The end of the fast headstock, and the end of the movable headstock, are true planes, parallel to eech other; the ends of the piece to be measured must also be parallel true planes; the feeling piece is a piece of steel about 2-10th thick, its eides being parallel true planes, and is introduced between the standard to be meaaured end the true plane at the end ot the fast headstock, when the proper adjustment has been made, the movement of the miorometer wheel one division—viz., one-millionth of an inch—will cause the feeling piece to be suspended—friction overcoming gravity.

A New War Vessel.—Mr. W. Pollexfen has invented a war vessel which he claims is "unsinkable." He proposes to construct the hull of solid timber in longitudinal and transverse layers alteroately, with the butts properly shitted, bolted together, and all calked watertight; outside he propoee to have 4-inch thick oak or teak planking running fore and aft, and this sheathed with copper or yellow metal plates. In the center of thie eolid arm will be formed compartmente large enough for machinery, coals, ammunition, stores, crew space, etc.; all these compartments, as well as screw shaft tunnel, to he plated with 12-inch thick armor inside, and all passages for suction and diecharge pipce to and from the enginee to be also armor-plated. The necessary provisione are made for protecting the structure from annihilation by fire and from damage by the enemy'e shells. To judge from the drawings contained in the pamphlet there ie much to justify the inventor's belief that "thie type of vessel will be the man-ot-war ot the future."

Underground Telegraph Lines in Paris.—C. Bontemps writee that the total length of the nnderground lines in Parie is 116 miles. Of this total, 35¼ miles are laid in trenchee and 80¾ miles in the eewers. The cables are composed ot one, three, five and seven wires, mostly the latter, and the wiree heve un aggregale length ot 2,266¾ miles.—*Jour. of the Telegraph.*

Points About Grinding.

In the course of an article ooncerniag grindstones, a writer in the *Iron Age* has the following on the action of the stone on the metal: Edge tools ure fitled up hy grinding, very much as a plank would he reduced in thickness wers a lerge plane employed in which were set a hundred or more of very small gouges, each outting a narrow groove. The sharp grit ot ths grindstone being harder thau the iron or steel, cuts very small channels in the surface of the metal, and the revolving disk carries away all the minute particles that are detached by the grit. If we were to examine the surfacs of a tool that has just heen removed from a grindstone, under the lens of a powerful microscope, it would appear, as it were, like the rough surface of a field which has been recently scarified with some implement which formed alternate ridges and furrowe. Hence, as these ridges and furrows run together from both sides at the cutting edge, the newly ground edge seems to he formed ot a system of minute teeth rather than to consist of a smooth edge. For this reason a tool is first ground on a coarse stone, so as to wear the surface of the steel away rapidly. Then it is polished on a wheel of much finer grit, and finally, in order to reduce the serrature as much as possible, a whetstone of the finest grit must be emoloyed. This gives a cutting edge having the smallest possible serration. A razor, for example, does not have a perfect cutting edge, as one may perceive by viewing it through a microscope. and yet the serrations are actually so much smaller than a human hair that the minute teeth out the hair in twain, but when the serrations on the edge of the razor become so battered np and dull that they will not sever a hair or cut a man's heard off, the edge must be honed and strapped until the system of minute teeth will he so much smaller than a hair that several of them will take hold of the smallest hair at once. These suggestione will furnish something ot an idea of the operation in grinding and whetting edge tools. Beginners ure sometimes instructed when grinding edge tools to have the stone revolve toward the cutting odge, and sometimes from it. When the first grinding is being done, this is a matter of indifferenoe, but when the finishing tonches are applied near and at the very edge, a grinder can always complete his task with more accuracy if the periphery of the grindstone revolves toward the cutting edge, as the steel that is worn away will be removed more easily. Whereas, when a stone runs in the opposite direction, the grinder cannot always tell exactly when the side of the tool is fully ground up to the edge. Thie is more especially true when the steel has a rather low or soft temper. The stone when ranniag away from the edge will not sweep away every particle of the metel that hangs as a "feather," but when the stone revolves toward the edge, there will be no "feather edge" to deceive the eye of the grinder.

Hardening Steel with Mercury.—The Indianapolis *Mechanics' Journal* notes that as the hardness of steel depends on the quickness with which it is cooled, there are better materials than water, which besides givss an unequal temper, the steam bubbles developed interruptiag contact: another thing, water is a bad conductor of heat, and if the bubbling and heat did not put it in motion, it would be unfit tor herdening. Water with plenty ot ice in it gives a harder temper; small tools may be stuck into a piece ot ice as jewelers and watchmakers insert them in a piece ot sealing wax. Oil is also used by them as being better than water, as it does not evaporate so easily. The Damascus steel blades are tempered in a strong current of cold air, passing through a narrow slit; this gives a much more uniform and equal temper than water. But the most effective liquid is the only liquid metal—mercury; this being a good oonductor of heat, in fact the very best liquid conductor, and the only cold one, appears to be the best liquid tor hardening steel-cutting tools. The best steel, when forged into shape and hardened with mercnry, will cut almost anything. We have seen articles made from ordinary steel, which have been hardened and tempered into a deep straw color, turned with comperative ease with cutting tools ot good tool-steel hardened in mercury. Beware of inhaling the vapor while hardening.

A Crane to Lift 160 Tons.—An English company has lately made a hydraulic crane for the Italian goverament which will lift 160 tone. The pletform of this crane revolvee upon a livo roller frame of 43 feet diameter. At the rear of the platform ie a counter-weight box, carrying about 350 tons, to counterpoiee not only the weight of the crane itself but of the load, so thut no lifting strain is brought upon the central pivot. The crane stande upon a masonry and concrete pedestal, 20 feet high and 50 feet diameter, the outer wall of which carries the path on which the live roller riug rnns, the center being hollow, and serving as a house for the hoiler and pumps empplying the water-pressure tor working the crane. The work of hiting is done by an inverted hydrnulic press, hung in gimballe, on a system invented by Mr. Rendel. The pumps are arranged to act direct upon the lifting press and turning engine of the crane, without the intervention of an accumulator. The crane ie revolved by an hydranlio rotary engine, which also drives a winch connected with a chain paceed over a pulley on the head of the jib, and available for lifting light loads. The rake is 65 feet, so that the crane commands a very large surface.

The Mining Share Market.

There are no special features of the Stock Market to report for the past week, bnainesa heing characterized hy a dnllnesa wbich has continned some time. A little spurt occasionally in one atock or another bas given a temporary animation, hut ontaide of thia there is notbing of special interest.

The honanza mines are showing an abnndance of ore of the finest character, and in the California tbe breasta are looking nnnsnally well in all directiona. The ore hodiea on tbe several levels of the Ophir are looking well, and the new eaat body on the 1600-foot level appears to be stea dly improving, while in the Mexican the cbances for finding a paying deposit of ore are conaidered excellent. The Hale and Norcrosa and Savage pumping machinery will soon be draining those mines; tbe new milla of the California and Conaolidated Virginia companiea will soon be in operation, and, in short, there will soon be seen great activity everywhere on the nortbern part of the lead.

At a meeting of tbe Trnstees of the Golden Chariot mining company, tbe old Board of Trnstees resigned and the following gentleman were elected to fill tbeir places: J. W. Shaw, President; John Rosenfeld, Vice-President; R. T. Carroll, Archie Borland, Joseph Clark, Geo. W. Grayson, and J. H. O'Brien. We hope that thia move will he of some advantage to the Idaho mines, wbich have for ao long been in a depressed condition under the management of men who did not seem to care a cent outaide of stock jobbing operationa. Miners remained unpaid and mines were shut down. If the new directory of the leading mine take the proper course, probably it will he of great benefit to the Owyhee minea. We hope ao, at least.

SEVEN deatbs from yellow fever occurred at Savannah, Georgia, on Friday.

A NUMBER of miners have been killed by the Indians in the Black hills.

GEORGE SMITH, the Assyrian explorer, is dead.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

New Discovery.—Amador *Ledger*, Sept. 2: A new mining claim is about to be opened up adjoining the northern boundary of the Gover mine at Amador City. We are informed by one of the owners that rich rock has been taken from the claim, and that the ledge may be traced for a long distance. A meeting of the owners was held a few days ago, at which it was decided to incorporate and proceed to level work forthwith. The mine has been christened the North Gover, and hopes are entertained that it will eventually compare with its neighbor and namesake in productiveness.

Hubbardsville Mine.—The work of taking out the water is being vigorously prosecuted on this mine. The water line is now more than 100 feet from the surface. It is a curious circumstance that the timbers of the shaft, placed there over 15 years ago, and which have been under water ever since, are in as perfect a state as when put there. Some rock has been taken from the 100-ft level, which looks remarkably well.

Gover Mine.—The Gover mine continues to develop splendidly. In the 500-ft level north, a very rich body of ore has recently been struck, and every part of the mine is looking well. A new shaft is being sunk and new hoisting works erected. A contract has been let to put up a new 20-stamp mill. Everything is in readiness for the foundation. Knight & Co., of Sutter Creek, are doing the work. Appearances favor the conclusion that the Gover will rival the leading mines of the county in the yield of precious metal.

The Phenix Mill.—The work of adding 20 more stamps to the Phenix mill at Plymouth is now being pushed ahead. It will perhaps be two months before the full 80 stamps are in running order.

Struck Rock.—G. W. Kling struck a promising looking ledge the other day on his claim at Amador City, adjoining the Keystone.

CALAVERAS.

Sheep Ranch.—Calaveras *Chronicle*, Sept. 2: The Wallace & Ferguson mine is looking splendidly. Levels have been run east and west from the shaft a distance of 150 feet. Distance between the upper and lower levels, 110 feet. The claim is 1,600 feet in length, the ledge averaging about 20 feet in thickness, and the rock is good for $50 per ton all the way through. A claim 1,600 feet in length, 20 inches wide and 110 feet in depth! Can there be an estimate of the dollars in it? A mine started seven miles in the woods, without money, and yet it has paid all working expenses in addition to building a mill and hoisting works with a 50-horse power engine, sunk a shaft 125 feet below the old works and declared something like $50,000 in dividends. If that showing doesn't evidence a good claim and superior management, then your correspondent is no judge of such matters. W. Knight is superintendent, and, under his mercurial, watchful eye, everything runs like clockwork. The mine is now owned by Ferguson, Wallace & Early.

Gwin Mine.—The Gwin mine shaft is being straightened and repaired, and as the work necessarily interferes with hoisting rock the mills have been temporarily shut down. The shaft has been in an unsatisfactory condition for some time past, and it was thought prudent to take the "kinks" out of it and put it in good shape before the rainy season sets in. The contemplated improvement will probably consume a month or six weeks' time, during which the mills will have to remain idle. The sinking for the 1200-ft level is completed, and when the shaft is fixed the mine will be in better shape than ever before.

Mill at the Duryea Claim.—We learn that the five-stamp battery being put up at the Duryea gravel claim, in Chile gulch, is so nearly completed that it will probably be ready to run the first of next week. As soon as the battery is in readiness, Messrs. Rigney, Kelly & Co., who have contracted to take 5,000 car loads of gravel from the claim, will commence work and operations will be vigorously pushed.

Gravel Mining.—There is no decrease in the activity with which gravel mining operations are conducted in this vicinity, although the water supply is not quite so abundant as it was earlier in the season. All the great hydraulics are in full blast and the tunnel claims, without exception, are running full handed. The prospects are good that there will be an adequate supply of water throughout the entire season, rendering the present year the most prosperous, in a mining point of view, we have experienced for a decade.

Glencoe Con.—Three weeks ago the Glencoe Con. mining company commenced work on their mine in Glencoe district. The property contains two strong parallel veins, some 60 feet apart laterally, each showing heavy croppings of low grade ore of considerable linear extant, and high grade ore near the central portion of the mine. The company are evidently merely testing different portions of the veins with the view of selecting proper localities for future extensive operations. Levels are now being run in an incline some 80 feet in depth, the ore in which will mill $40 per ton.

Upper Country Mining Notes.—We have the following intelligence from mines in the West Point district: Champion, sinking. The shaft is down 320 feet, at which depth the ledge shows larger and richer than at any point near the surface. A crushing of rock from the Champion is now being put through Carlton's mill. Splendid ore is being taken from the Mina Rica. The ledge averages about 20 inches in width, all good milling rock. The prospects of the Mina Rica are encouraging. Active operations are in progress at the Josephine. The new mill belonging to the mine is running and work is being vigorously pushed. There are no better mines than the Josephine. Fields & Co. continue taking excellent ore from their mine. Good rock has lately been discovered in the "Deuteronomy," owned by Reed & Co., and rich ore has also been struck in the "Smokestack," the property of Steger & Co.

EL DORADO.

Work to be Resumed.—El Dorado *Republican*, Aug. 31: Some two weeks ago Mr. Hodge, superintendent of the Kelsey mine, went to San Francisco to report to his company, taking with him a sample of the ore at the present terminus of the tunnel. We learn that the company were so well satisfied that arrangements have been made to continue the tunnel, and work will be resumed next week. The tunnel will continue alongside the ledge, and a cross-cut made about every thirty feet, until it is satisfactorily demonstrated that there is ore enough in sight to warrant the building of a mill, when the ore will be taken out. All who have examined the mine speak highly of it.

FRESNO.

The Mines.—Fresno *Expositor*, Aug. 31: The late reports from the mines are not so favorable as those previously received. We met two or three gentlemen last week, who claimed to be old miners, and who had visited the Centennial mining district. They pronounce the new golconda a fraud. They say that gold does not exist, and if it did, the mines could not be profitably worked.

INYO.

Lee District.—*Coso Mining News*, Sept. 2: On the 31st instant we paid a visit, in company with Prof. Thomas Price, of San Francisco, to Lee district, and found the Emigrant company's mines looking splendidly, the dumps being filled with the finest kind of free milling ore. At present the work is being prosecuted entirely on the Cactus mine, in which there is ore enough in sight to permit the extraction of 15 to 20 tons per day for several months to come. The ore will mill at least $100 per ton, it being entirely free milling, with the exception of a slight percentage of lead, but not sufficient to interfere with its successful working, as is shown by the fact that they are now working it up to 80 and 85 per cent., without roasting. The mine improves in appearance as depth is reached. The ores which have been worked for the last two weeks have averaged nearly $1,50 per ton.

We now go to the mines of the South Emigrant company, which are extensions of the Cactus and Valentine, the two prominent mines of the Emigrant company. We find them sinking on the Twilight, the northwesterly extension of the Cactus, and the shaft has reached a depth of about 20 feet, being sunk directly on the vein, all the way in good quartz and ore exactly like that in the Cactus. On the Revenue mine, the southeasterly extension of the Cactus, the shaft is down to about 40 feet, with the very finest indications of striking ore at no great depth. While the Emigrant company are reducing their ores under the greatest difficulties, still they are turning out bullion to the amount of $500 per day with a five stamp mill, which can only run three days in the week for want of water. A sad mistake was made by somebody in placing the mill where it is—some nine miles from the mine, to which all the ore must be hauled, and from which water must be hauled to the mine. At the time the mill was located at the present point, it was supposed that no other water short of Owen's lake could be had, but subsequent research has disclosed the fact that water for all practical purposes of a 40-stamp mill can be had by piping some a distance of eight miles, with a pressure of over 1,000 feet. There is at least a dead loss to the company of $25 per ton, over and above what it would cost to work the ores at the mine. In other words, a 10-stamp mill could be run constantly for one-third less money than it is at present worked, and only three days in a week. Where the company are now turning out $500 per day with the present mill, with a 10-stamp mill at the mine they could turn out $1,500, and at one-third less expense. An abundance of out pine wood for fuel can be had within three miles of the mines, sufficient for years to come. Our opinion is corroborated by Prof. Price and other experts and geologists, who have examined them, that the mines of Lee district are not liable to give out, but, on the contrary, they are true fissures, carrying quartz for their entire length, the ore chimneys being regular and of great extent. The foundation is very solid, has not been misplaced in the least, and if true veins do not exist in Lee district we do not know where we can look for them.

Furnace Started.—Inyo *Independent*, Sept. 2: The upper Cerro Gordo furnace started up yesterday for another one of its long runs. The lower one is being refitted, or rather rebuilt, with a new water jacket. The new hoisting works are in steady operation, the shaft being at a depth of 351 feet in ore when our informant left.

Lookout District.—Cor. San Joaquin *Argus*, Sept. 2: A project is on foot to carry 500 tons of ore to the Defiance furnaces at Darwin, and see how it works preparatory to erecting furnaces. A mill will hereafter be determined on. The hauling to Darwin will cost $25 per ton, and $30 for smelting. One furnace will reduce 30 tons daily, of say $100 ore, profits $45 per ton, or a total of $1,350 daily. Our various dumps are now loaded by about 1,000 tons of ore that will average over $100 per ton: in other words over $100,000 worth of ore lying loose on the ground.

The Kearsarge.—We see by the Inyo *Independent* of the 26th inst., that the Kearsarge mill, near Independence, after having had a thorough overhauling, is about to start up, and since they have a Bruckner furnace for preparing their ores for proper amalgamation, there is hardly a doubt but that the mill will make a very successful run. The richness of the ores are well known, and it has only been from want of their proper manipulation, heretofore, that this property has not made good returns for the investments made by the owners.

Incorporated.—The Inyo *Independent*, of the 26th, says: The Rex Montes mining company has just been incorporated with a capital of $3,200,000, in 32,000 shares of 100 each. This is the same property Mr. J. H. Holt is at work upon on Kearsarge mountain, and which is developing in the most satisfactory manner. We have not learned the names of the officers or incorporators.

NEVADA.

Sparrow-Hawk.—*Foothill Tidings*, Sept. 2: This mine, situated on Woodpecker ravine, north slope of Osborne hill, is attracting considerable attention of late. It is owned by a lot of working miners of this place, who have been running a tunnel to open it up for some months past under rather discouraging circumstances—the ground having been against them—but within the last few days such indications have been struck as tends to shorten up the faces of all concerned. They all feel good, in fact, and think they have the biggest thing in the country. The tunnel is now in 278 feet and a shaft down about 60 feet. In the bottom of tha shaft the ledge is about four feet thick and the rock is of a peculiar character, showing splendid sulphurets and some gold. The tunnel is expected to cut the ledge within 20 or 25 feet, and will give them nearly 100 feet of well drained "hacks." The boys have stuck to this work nobly and are deserving of the bright reward now apparently assured them.

The Alaska mine, out on the Colfax road, beyond Payne's ranch, is looming up as one of the regulars. A new hoisting works is going up over the shaft, now down something like 80 feet. The size of the building is 24 by 60 feet on the ground, and two engines, one for hoisting and the other for pumping, with all the necessary machinery for a first-class works, are going into place under efficient managers and workmen.

The Idaho is said to be looking splendid at this time, the pay chute having been met in the drift from the 1000-ft level much nearer than was expected, showing either that the chute has taken a turn down or, what is better, that it has swelled out in bonanza form. The old Idaho is surely a good thing to have around, not only on dividend days, to the stockholders, but pay-days, to the workmen. Long may she continue to pan out.

The Franklin, Allison ranch, cut the ledge again this week with their incline—it has flattened off away from the incline for a time, but came down on pitch again—and so much water came in that the large 10-inch pump had to be put in. We understand also that the ledge is very rich at this point.

The Washington mine, out east of the Idaho, has a ledge over three feet thick in the shaft and the rock looking well. Pumping is done by water power, and the company have very encouraging prospects.

The Greenhorn mine is turning out some very satisfactory rock of late. Several loads recently crushed, we understand, gave $23 per load, without counting sulphurets. Another crushing is soon to be heard from.

The Fryer Process.—*Foothill Tidings*, Sept. 2: Fryer, and his last attempt to make his "process" work, down at the Prospect mine, had nearly passed out of mind until yesterday, when we happened to ask a Prospect stockholder how the thing was getting along. "Fryer he hanged," said he, "we are losing all this season and nothing done. If we had put on a mill, Prospect would have been all right now." It seems the octagon stamp-pan-barrel crusher-pulverizer-amalgamator don't perform all it's agreed to and resort is had to stamps some miles away, which makes it slow work testing the "process." Some little change is understood to be necessary in order to make it a success. There is no use that we can see of holding back any longer the expression of our candid opinion of the "process," which is that as a "process" there is nothing in it. The roasting may partially desulphurize the ore, but this kind of roasting, it is our honest conviction, can be better, easier and more cheaply done in a common "draw" limekiln than in the tilt-bottom one of Fryer. The subsequent treatment by Fryer, which was claimed at one time to be the important part of the process, always appeared to us child's play. On the principle that there is room for much improvement in the manipulation of our ores, both silver and gold, more especially those which contain these metals in combination with minerals of a baser nature, we never condemn a "process" at first, as some do on general principles, for we believe some good may come of any experiment, but there certainly can be no use in winking at this attempt any longer, and thereby keeping mine owners in suspense in regard to the kind of works they ought to put up.

PLACER.

Fine Specimens.—Placer *Herald*, Sept. 2: Mr. H. Adams showed us some specimens of quartz gold, a few days ago, worth from $1 to $3 each, which he had recently taken from his claim, located about a mile and a half west of Clipper Gap. The claim is of gravel formation and seemingly there is a vein through it that is very rich. This lead was first struck by Mr. Adams a year ago last winter, when he took out, in a few weeks, over $3,000. Having got this much, he lost the vein, and, not finding it readily, he, for the time being, abandoned operations. A short time ago he concluded to renew the search, and these specimens are evidence of the result.

PLUMAS.

Good Prospects.—Plumas *National*, Sept. 2: The work done on the Smith claims, at Gopher Hill, is developing some valuable ground and proving that the claims are rich as well as extensive. The company owning the claims have run a fine large working tunnel 350 feet in length through the rim-rock. At the end of the tunnel two chutes have been raised into gravel, which at this point is some 12 or 15 feet above the tunnel. The gravel prospects look well and the workmen are now taking out good pay. The main tunnel will, after a while, be run back, and will strike through, as the rock pitches back from the rim. Only six men are at work at present, but the force will be increased as soon as more room can be made for more hands to work to advantage. There is an abundant supply of good gravel for years to come, and the owners can congratulate themselves that they have one of the finest drifting claims in this section.

SIERRA.

Keystone Mine.—*Mountain Messenger*, September 2: This mine, after a series of mishaps, owing principally to the pumping machinery being too light for the work required of it, is now under the management of Geo. W. Hughes, free from water, and the prospects are that considerable good rock will be taken out, the influx of surface water having subsided to such a degree as to warrant the belief that it can be safely handled. Hoisting of ore will be commenced to-day (Friday), and the mill will be started as soon as 250 tons of ore are above ground. A contract for 300 cords of wood has just been completed, and a contract for 400 cords more has been let, which, it is calculated, will run the west drift, hoist the quartz and mill it. To complete this west drift and mill the ore, will take until the 10th or 15th of December, barring accidents. After this work is done, it is proposed to work chimney No. 1, 330 feet above the main tunnel and known as the "Mexican shaft." Should the company decide to put in stronger machinery this winter, about 700 cords more wood will be required. One good thing about this mine is, that when the company has been able to get out rock and work it, it has always paid.

STANISLAUS.

La Grange—Stanislaus *News*, Sept. 1: The La Grange mining company's works are being run to their full capacity. Some 75 men are employed by the company, and the claim is said to be paying large dividends. Some 1,300 inches of water are used in piping and running off the bed of the deep gravel on French hill. Had these mines a little more fall for running off the tailings they would, as at present worked, be the most valuable piece of property in the state.

SOLANO.

St. John Mine.—Vallejo *Chronicle*: The development of the St. John mine still grows more and more favorable. The product of the mine for August will be greater than that for any month previous in the history of the mine. The company have got well along with the erection of a third furnace, which will be larger than either of the present two. The hoisting works are now being run in the chamber at the end of the main tunnel. This chamber is about the largest of any in any mine in the State, being about 90 feet in length, 60 in width and 70 feet high. All of the ore from the upper levels is now chuted down into the main tunnel, from whence it is hauled to the dump and railroaded to the furnace. The railroading costs at the trifling rate of $1.50 per 100 tons, or a cent and a half per ton.

TUOLUMNE.

Soulsby.—Sonora *Democrat*, Sept. 2: Level No. 7 of the Soulsby mine promises first-rate prospects, having only recently been opened at a depth of 520 feet and uncovering very rich rock, containing free gold and sulphurets in varying quantities.

Nevada.

ELY DISTRICT.

Mining Notes.—*Record*, Aug. 27: During the past week $5,643 in bullion has been shipped by Wells, Fargo & Co. The hoisting works of the Meadow Valley having been finished, a trial of them was made on Monday last, the result being very satisfactory. They are now idle. About 40,000 pounds of pumping machinery have arrived during the past week, it being stored at the mine. A small amount of chloriding and other work is in progress. In the Raymond & Ely prospect work on the 8th, 10th and 11th levels is pushed ahead. Chloriding in some of the upper levels is still going on. The Pioche mine is not being worked at present. There is no change to note in the Alps mine, prospect work is continued and pushed on the lower level and the usual work of extracting ore from the upper levels. The mill has been running a portion of the past week, want of water compelling its stoppage occasionally. The Huhn & Hunt mine is now working six men, who are taking out a good quantity of ore. No other mining work of any importance is now in progress around Pioche, and what little is doing at present is not very encouraging, although the promise of the starting of the work on the Meadow Valley pump, if not delayed, will push up matters considerably. The election of the trustees of the Meadow Valley company took place on the 24th inst. The old board was elected with the exception of Robt. Morrow, Jno. P. Kelly being elected in his place.

TUSCARORA DISTRICT.

New Strike.—Pioche *Record*, Aug. 30: Elko and vicinity are just now being excited over a new strike west of Tuscarora, and already several parties have been started out to examine the locality. The lead recently located is situated about 12 miles northwest of Russell & Bradley's cattle camp, on Willow creek, and 14 miles west of Tuscarora. Some of the ore, which was taken from the surface and brought to this place, was assayed, and gave the most flattering returns. Another piece, which was hurried in a forge at Phillips' shop, showed silver in large quantities, the precious metal standing all over it in small globules. The ledge is traceable for about the distance of a mile and a half, and is said to be very regular and contains large amounts of mineral.

WHITE PINE DISTRICT.

Pretty Good Ore.—White Pine *News*, Aug. 30: B. B. Martin, the owner of the Tallahassee mine, on White Pine mountain, has just received returns from a lot of ore he sent over to the Richmond works, at Eureka, which assayed $137 in silver and 40 per cent. lead. The company allowed him $70 per ton for the ore. Mr. Martin was agreeably astonished to find that his ore would furnace so well, for the reason that he was never able to get any such assays from it. He immediately set a force of men at work in the mine, and will take a large amount of ore and send it to the Richmond works. Mr. Martin has been working alone in the mine since last June. Besides the ore sent to the Richmond he has 12 tons on the dump. There are a hundred just such mines as the Tallahassee lying idle in this district for the want of capital to develop them. Notwithstanding this, prospectors and capitalists are hunting all over the country for paying mines, when a small amount of capital will purchase properties here that are partly developed.

"Old Smoky" to Start Up.—After lying idle for three years, this mill is again to be set in motion. The owners of the Stafford mine, consisting of Sam Paul, Tim Shine and Johnny Flynn, have leased the mill property for one year. They are now putting it in repair, and expect to commence crushing rock by the 10th of the present month, and they hope to be able, weather permitting, to run right along all winter. They have some 200 tons of ore on their dump at the mine, and can take out enough daily to keep the mill constantly running. We are pleased to know that the "Old Smoky" is to start up again, for it looks like business, and we have no fears of its being a failure in the hands of practical men, such as now have it in charge. We look upon this as the forerunner of other enterprises that will soon be inaugurated in this district.

OREANA DISTRICT.

Bullion Shipment.—*Silver State*, Aug. 30: A dispatch from Oreana district informs us that the Hurricane company shipped a carload of bullion yesterday and another to-day. Each carload contains over 20 tons of base bullion. The Oreana smelting works, recently purchased by the company, are now in full blast and running splendidly. The first 24 hours' run in one of the furnaces produced five tons of bullion. The company's mines continue to look well, and there are fair prospects of the bullion yield being increased.

PYRAMID DISTRICT.

Favorable News.—Nevada *Journal*, Sept. 2: The news from Pyramid City continues favorable. On Wednesday some fine ore was encountered in the prospecting shaft on the Jones claims. It assays $103 in silver and $5 in gold, a total of $108. The tunnel in the Sep. Monsrch is being pushed and shows favorably daily. The main ledge will soon be struck, and then we shall know the kind of a camp there is out there. A great deal of prospecting is being done in other portions of the district, and altogether the outlook is decidedly encouraging.

WASHOE DISTRICT.

California.—Gold Hill *News*, Aug 31: Daily yield, 700 tons of ore. The ore breasts at all points are showing unusually fine. The ore is rich in every quarter of the mine. The bullion yield, which promised at one time to considerably exceed that of July, will probably reach $2,000,000, the amount having been greatly lessened by some necessary repairs to the mills, and a delay in hoisting ore through the Ophir shaft caused by the breakage of a cable. The usual dividend may be looked for, although a surplus sufficient will be placed in the treasury by that time to more than double it if the management so desire. The south drift on the 1600-ft level has penetrated the ore body a distance of 155 feet, the face of the drift still in the richest character of ore. The new mill will be in complete order for starting up by the 6th of September. The flow of water at the bottom of the C & C. shaft is still very strong, averaging about 45 inches, miners' measurement. The pump has been running at the rate of ten strokes per minute for the past five days, and has about all the work that it can do. Sometimes the flow of water will slacken so as to allow of sinking the shaft from ten to thirty feet, when a crevice will be opened and the workmen again drowned out of the shaft. It will then take three or four days to reduce the water sufficiently to again begin work, when the same operation will be repeated.

Melbourne.—Grading for the hoisting machinery is steadily progressing and will be completed in a day or two more. Commodious hoisting works will shortly be erected, Mr. Heagorty, the superintendent, being instructed by the company to procure machinery sufficiently powerful to sink the shaft to a depth of 1,000 feet immediately. The shaft on which sinking is going steadily on is in ledge matter the entire depth, and some very fine streaks of quartz have been encountered.

Justice.—Daily yield, 110 tons of ore, keeping the four mills steadily running. The ore stopes on the 400, 500 and 600-ft levels are showing finely, and are yielding good ore. East cross-cut No. 1, from the south drift on the 800-ft level, is advancing toward the ledge. Day before yesterday, cross-cut No. 2, from the same drift, cut the ore vein, uncovering some splendid ore, with a good prospect of developing a fine body. This ore is a combination of the ore recently struck in cross-cut No. 3, 100 feet further to the southward. Cross-cut No. 3 is rapidly penetrating the ore vein, which at that point is wide, well defined and ore of a good milling character.

Dayton.—Sinking the main shaft is making fair progress. The flow of water at the bottom is still strong. Cross-cutting the ledge in the southern portion of the mine on the 300-ft level has been commenced in good earnest. Cross-cutting and opening up the ore vein on the 500-ft level will be commenced immediately and driven ahead with all possible vigor. As soon as the development of the ore vein on the 500-ft level is well under way, the same character of work will follow on the 700-ft level, and by the time the 700-ft level is crosscuted, the 900-ft level will be ready to open, so that during the next six months to come some lively work will be done. The machinery has been given a thorough overhauling.

Imperial Con.—Daily yield, 30 tons of ore. The ore stopes from tha north winze, below the 2000-ft level, are being extended both north and south, and are showing well. The north drift on the 2000-ft level is being pushed ahead with all possible vigor to meet and connect with a south drift now being run from the Alpha bullion drift. This connection will give a much better circulation of good air and greatly facilitate the developments on the 2000-ft level.

Con. Virginia.—The repairs are completed and the shaft sunk to the 1550-ft level, where a large and commodious station is being opened. As soon as this station is completed, which will be about the 5th of next month, the extraction of ore will be resumed with a fair prospect of a long and prosperous run. The extraction of ore has been necessarily light, owing to the interruption caused by the shaft repairs, and the want of milling capacity for the past month. This, however, will make no difference in the payment of the regular monthly dividend, as the reserve now in the treasury is amply sufficient to more than pay all expenses and make the usual dividend also. The mine is in fine working condition at every point. The new mill is nearly ready to start up, so that when the extraction of ore is resumed, there will be no impediment to the successful taking out of any desirable amount.

No work is being done in the north drift on the 1700-ft level.

BULLION.—An east cross cut has been started on the 1700-t level to cut the ore vein. The face of this drift is in soft, favorable ledge material, but will have some distance east to run in order to reach the ore vein. The Alpha drift on the 2000-ft level is being again advanced at as rapid a rate as the great heat encountered will admit of.

YELLOW JACKET.—The south drift on the 2040-ft level from the bottom of the south winze is in a distance of 77 feet, the face in dry porphyry, with quartz seams running to the southeast and carrying some ore. The main south drift on the 1 40-ft level, running to connect with the Crown Point mine, has passed through the Kentuck, and is now in the Crown Point ground. Retimbering the south winze between the 1740 and 1940-ft levels is completed.

PHIL. SHERIDAN.—Sinking the shaft is advancing. There is still a considerable flow of water.

OPHIR.—Daily yield, 300 tons of ore. The ore breasts on the 1600-ft level show well and are yielding good ore. The east ore body recently struck on that level is proving much better than it was expected to do when it was first cut. The face of the west cross-cut, 200 feet south of the Mexican line, is in quartz and low grade ore. Sinking the main incline is making good progress.

CROWN POINT.—Sinking the main incline is making good progress and will have but a few feet more to sink to reach the 1800-ft level. The main south drift on the 1700-ft level is rapidly advancing, the face still in quartz and low grade ore. It now has only about 40 feet more to run to reach and connect with the new Belcher air shaft.

LADY WASHINGTON.—The work of easing up the timbering of the shaft, necessitated by the swelling of the ground at some points, is completed, and sinking actively resumed. The bottom is hard quartz material of the most favorable character, and the chances are that an ore body may be encountered before long. Owing to the powerful machinery and ample pumping arrangements, no trouble is experienced in handling what water comes in, and none is anticipated.

JULIA.—Excellent work is being done at all points in the mine. The face of the main south drift on the 1800-ft level is still in h e quartz, with spots of excellent ore. The east drift, on the same level, is also showing some good ore.

WARN.—Sinking the shaft is going ahead six feet per day. The rock in the bottom blasts well and good progress is being made

CHOLLAR-POTOSI.—Daily yield, 100 tons of ore. The ore breasts afford the usual amount of milling ore. Sinking the main incline is going ahead at the rate of two and a half feet per day. Sinking the new combination shaft is also making good headway. The erection of the huge pumping engine and auxiliary machinery is going steadily forward.

SIERRA NEVADA.—A drift east has been started on the 1750-ft level to cut and prospect the ore vein. The quartz body recently developed by the north drifts on the 1500 and 1250-ft levels is showing well

LADY BRYAN.—The surface preparation for the reception of the new and powerful pump machinery is going ahead as u sual. A portion of the machinery has been already shipped.

COSMOPOLITAN.—The main drift north, following the vein, continues in very promising ledge matter, with streaks of good ore. The drifts from the npraise are yielding considerable good ore.

HALE & NORCROSS.—The new pumping machinery will be in complete readiness to steam up and set to work by Saturday next.

UTAH.—Sinking the main shaft is going rapidly ahead. The shaft will soon have attained a depth sufficient for opening a station at the 900 fe level.

SAVAGE.—Putting in the pump and columns in the shaft is nearly finished.

NORTH CARSON.—Good stringers and bunches of ore continue to he met with in sinking below the 250-ft level.

ALTA.—The rock in the bottom of the shaft blasts well, and the flow of water gives little or no trouble whatever.

AMAZON & GLASGOW.—The new pumping machinery will he on the ground ready for erection by to-morrow. Much better progress can then be made with the prospecting.

NORTH CON. VIRGINIA.—The pumps are all in place ready to start up, down to the 840-ft level. The pump columns and sinking pump are in place ready for work, down to the 900-ft level.

GOULD & CURRY.—The work on the main shaft is still the feature of the operations in the mine; it is steadily progressing. Sinking the combination winze on the Savage line is making fair progress. It is now down 300 feet, the bottom in hard blasting rock.

BALTIMORE & AMERICAN FLAT.—The past week has been mostly consumed in necessary repairs to the boilers, so that but little work has been done in the mine.

TROJAN.—Sinking the main shaft is making excellent headway, the bottom being soft clay, quartz and ore mixed. The air winze below the 180-ft level has been sunk a distance of 35 feet, the entire distance through good milling ore. The dump is being rapidly filled up with ore taken from the winze.

SILVER HILL.—The station at the 650-ft level is completed. As soon as the water tank is finished, sinking the main shaft will be resumed.

OVERMAN.—Putting in the foundations for the new pumping machinery is being pushed with steady vigor. Sinking the main shaft is making fair headway.

BELCHER.—Daily yield, 350 tons of ore, keeping the mills steadily running. The erection of the new pumping machinery is being pushed with all the speed possible.

WEST BELCHER.—Ore extraction is going forward lively from the npraise west, above the 300-ft level. There is plenty of ore in sight, and the bullion results will soon place the West Belcher among the producing and profitable mines of the Comstock.

TWIN PEAKS.—It is necessary to finish the road to the works before the machinery necessary to carry forward the work of development can be hauled to the mine.

PROSPECT.—The pumps keep the water reduced below the 400 ft station, and the diamond drill is being pushed ahead to prospect the ledge.

NIAGARA.—Sinking the main incline is being pushed with all possible vigor. The rock in the bottom of the shaft is much harder than it has been for some time past.

ORIGINAL COMSTOCK.—Work being actively resumed under most favorable auspices, some very fine and encouraging prospects in the way of pay ore being developed.

HERALD.—Bottom of incline continues in excellent vein matter, giving good assays and constantly improving.

KOSSUTH.—Preparing to cross-cut and open up the ore vein on the 500-ft level is going steadily forward.

BUCKEYE.—The north and south drifts on the 500-ft level are each steadily advancing, the face of both being in quartz and vein matter of a lively and encouraging character.

ROCK ISLAND.—The pumps are still kept busy hoisting water. No advancement can he made in the prospecting drifts in the mine until the flow of water is checked.

BEST & BELCHER.—But little work is being done in the mine at present, the time being occupied by the repairs to drifts and the Gould & Curry shaft.

CALEDONIA.—The water has been drained and work was resumed in the bottom of the shaft yesterday morning.

MEXICAN.—The northwest drift on the 1465-ft level is advancing, the face still in fine quartz and ore.

(Continued on Page 180.)

Mathematical Instruments at the Fair.

John Roach, the mathematical instrument maker, whose exhibit is on the ground floor near the orchestra, is deserving of more than a passing notice, and is worthy of being classed first among the industries of San Francieco. Each instrument bas some peculiarity and improvement, the result of a lifetime of study and close application to an intricate business, which has made Mr. Roach verily a master of his art. There are on exhibition

Plain Transits

With single vernier reading to single minutes, with large compass needle well suited for land surveying. These appear at first glance to be short centered instruments, but on examination will prove to have longer centers and more substantial socket than those made East. The two vernier instruments are made in a similar way.

A Polar Transit

For public land surveying has a revolving telescope, a complete compass circle, and the arcs so divided that triangulation may he performed with this as well as any angular instrument, while the solar part is of a large radius, insuring great accuracy.

A Miner's Transit.

Having an extra telescope on the end of the horizontal axis, admits of any angle being taken, as up or down a shaft, and a prismatic eyepiece allows of an easy position of the observer. There is besides an eight inch instrument reading to 30 seconds. Another five-inch instrument is on exhibition, which is eminently fitted for underground work, and which should be in the hands of every mining engineer. The balance of the case is filled with various instruments: glass syphon tube for mountain barometer, aneroids, thermometers, hygrometers, saccharometers, hydrometers, ground spirit levels, platinum points for lighthouses, etc.

A card of medals which date from New York 1834, 1836, and in San Francisco 1862, 1875, must not he overlooked. A nice telescope surmounts the whole case, and we are glad to confess that for beauty and finish of workmanship, and for the eminently practical way in which the faults of other manufacturers are carefully avoided, Mr. Roach's instruments rank second to none made, and are deserving of the highest praise.—*Mechanics' Fair Daily.*

Photo-Printing on Wood Blocks.

The negative is, of course, taken in the usual way; but as it must be reversed on the block it should be taken through the glass, that is, the film side should he next the door of the slide, the thickness of the glass allowed for in focusing, and the spring of the slide kept from the film, in any of the well known modes. To prepare the block, dissolve five grains of chloride of barium in about half a drachm of sulphate of barium. This is then gently rubbed over the surface of the block—first with the finger and then with the ball of the thumb—so as to produce an even, thin coating, which result is easily obtained after a little practice. A coating just sufficient to whiten the surface will be found enough. Or the two salts of barium, in very fine powder, may be intimately mixed, and, by a circular motion of the finger, applied to the block, when sufficient will be found to have adhered to answer the purpose. The barium chloride is converted into silver chloride, and the surface rendered sensitive as follows: Six grains of pyroxylin is dissolved in half an ounce of ether and two drachms of alcohol; then twenty grains of silver nitrate is dissolved hy heat in two drachms more of alcohol, and added. This should stand till clear, and will keep well if light be excluded. The silver collodion is poured on and off the block in the ordinary way, and may be dried either spontaneously or by artificial heat. In consequence of the rigidity of the block the progress of printing cannot be examined in the usual way; but with a moderate amount of practice there is little difficulty in hitting the proper time without examination. By a method we have lately adopted, the progress may be examined from time to time, and the block returned to its proper place with ease and certainty.

The printing should not he deeper than the finished image is intended to he, as it does not seem to lose anything in the fixing, but rather appears to get a little deeper. On removal from the frame, the surface of the block should be brought into contact with a solution of hyposulphite of soda in a flat dish, and moved about on the surface for a few minutes, when it will be found sufficiently fixed, requiring only to be washed with a gentle stream of water and set up to dry. Or if it he desirable to get rid of the thin film of collodion, it may easily be dissolved off hy a mixture of ether and alcohol before the application of the hxing solution.—*British Journal of Photography.*

SAVING IN LONG RUNS.—The long engine runs adopted last winter on the New York Central and Hudson River railroad (engines go through between Buffalo and Albany, 300 miles) have resulted in a notable economy in locomotives, the company having been able to lay up 42 of its stock of engines, notwithstanding a large increase in traffic. There are other considerable economies effected hy it, as in fuel (saving heating up, cleaning, switching, etc); and the company is altogether satisfied of the wisdom of the change. It is not pleasant for the men, who are compelled to be away from their homes a much longer part of the time, but the economy is such that there is no prospect that the practice will be abandoned for the old one.—*Railroad Gazette.*

The Engineer.

The Colossa of New York.

There are times when art approsches the confines of engineering, and we know no better modern instance than the great statue of the Goddess of Liberty, which the French will erect on Bedloe's island in New York hsy. The *Iron Age* notes that a fragment of the statue has been put ashore from a French steamer during the week, and describes it as follows: The fragment was contained in a huge case, as large as a small dwelling, made of boards nailed rudely together, with open spaces between. All of the statue it held was the wrist and right hand, with a section of the torch which the right arm is to hold aloft, hearing a flambeau, which will serve as a lighthouse beacon. The vast case rested on a truck and was an object of much curiosity to the people around the docks. The French sailors of the *Labrador* fairly danced around it in their enthusiasm, calling on those in the vicinity, whom they guessed were Americans, to come and "zee ze tumb." The thumb, which partly encircled the torch (a huge cylinder of 12 feet in circumference) was a ludicrously gigantic member. On the thumb nail alone a man of several hundred pounds avoirdupois might find a more roomy seat than in a Third aveuue car. As for the arm below the elbow and opening into the palm of the hand, three men ot ordinary stature might walk shreast within its interior. It is said that inside the upper and broader part of the arm above the elbow as many as nine men can be comfortably accommodated. This fragmentary part is made of bronzed copper, about a sixteenth of an inch in thickness. It is in fine, evenly rolled plates, riveted and screwed together in the firmest and most elaborate manner. The completed statue will be about 120 feet in hight, from the crown of the head to the sole of the foot, the elevation of the pedestal being, perhaps, a third of the altitude of the statue. It is understood that a staircase will he placed within the right arm, by which ascent can be made to a balcony running around the edge of the flambeau. The hight of the complete arm is 35 feet. Of course, the statue is upright. The left arm is bent so as to enfold and hold lightly toward the body a set of tablets upon which the Declaration of Independence is supposed to be inscribed. A tunic falls over a peplum from the shoulders to the feet. The head is surrounded by a diadem, from which projects a circlet of prongs that catch the sun's rays and construct a brilliant nimbus of glory out of them. The folds of the outer garment are so arranged that the edges fold diagonally across the figure. Its estimated cost is $125,000, half of which has already been subscribed. Both pedestal and statue will he completed in two years from now, and it will be the joint enterprise of France and America. Along with the fragment already received and the portion on exhibition at Philadelphia, the right arm is supposed to be complete.

LESSEPS' NEW SCHEME.—The *Revue Industrielle* contains some figures in connection with M. de Lesseps' new scheme of turning the great desert into a garden. At the last meeting of the academy of sciences he presented the summary report of Capt. Roudaire upon the "establishment of an interior sea in the African desert." "We have reason," says M. de Lesseps, "to be satisfied with the results obtained by our compatriot *savant;* he is henceforth sure that there can he established a sea of from 25 to 40 meters in depth, and which shall cover an area of 16,000 kilometers (6,200 square miles), with a length of 400 kilometers (250 miles) from east to west. In applying to the works for executing the new marine lake, the mean cost of the work in hand in Egypt, (0 francs, 95 centimes, [= 18 cents] per cubic meter of sand) the cost of the enterprise will hardly exceed 40,000,000 francs ($16,000,000). The revenue of the fisheries would represent, alone, an enormous interest on the capital expended; since we see, in Egypt, the fisheries of the salt lakes produce 1,500,000 francs ($300,000) revenues. In this great submersion of the desert, not a single oasis will be destroyed; Capt. Rondaire is assured that the cultivated points of the desert are, without exception, 20 meters above the sea level. Capt. Roudaire is present at the meeting, and I am happy to express before him the high opinion which we have of his courage, his perseverance, and his disinterestedness."

AN ENGINEERS' INSTITUTE IN CHINA.—A marine engineers' institute has been established in Shanghai, China. We learn that on May 26th last, the inaugural *soiree* and entertainment of the newly formed association was held in the Temperance hall, Shanghai, and was in every sense most successful. The leading European residents honored the meeting by their patronage and presence. During the evening the chairman presented a beautifully illuminated address, conveying the thanks of the members to Mr. James M. Robsou (late of Newcastle-on-Tyne), for his services in promoting the formation of the club. The library of the institute already contains 1,000 volumes, and the whole scheme will be of great value to the European engineers in China waters.

The Work in the Channel Tunnel.

We have spoken of the inception and progress of the tunnel under the British channel. We now have details of the method of operations, which are of general interest. The correspondent of the *Graphic* writes as follows:

Day aud night shifts, each of six workmen and a foreman, have been at work ever since the 25th of February, when the ground was broken, snd on Saturday afternoon (June 3d) they had reached a depth of 61 meters—200 English feet—in *craie de Rouen* (gray chalk), which was entered at a depth of 35.95 meters—118 feet. As one of the objects of these borings is to gauge the amount of water that is likely to be met with in the final operations, the shaft has been lined to a depth of 50 meters with iron tubing, let in telescope-wise, of different dismeters. The first tube is 10.26 meters long and 43 centimeters in diameter; the second 17.05 meters long and 38 centimeters in diameter; the third 23.30 meters long and 33 centimeters in diameter; and the fourth 50.02 meters long and 28 centimetera in diameter. The annular space between the tubes has been filled up with cement grouting, to make it water-tight and to consolidate the whole.

The operations are twofold—first, breaking, turning, twisting, and crushing the ground at the bottom of the shaft hy means of an instrument called a trepan, acted upon by a powerful lever; when this has been effected an iron scoop five feet long is let down by rods, and turned round till the foreman considers it full, when it is withdrawn. This operation, at 60 meters, occupies 40 minutes. On reaching the surface the scoop is emptied, its contents carefully examined, and specimens collected; the scoop, after being well washed, is sent down again, the return operation occupying 10 minutes. Two rods only have broken during the whole operation, and these were withdrawn without much difficulty. Two tubular pumps are on the works, the larger one having been discarded since the tubes of 33 and 28 centimeters in diameter have been fixed; the pump with a smaller bore is occasionally sent down the shaft to pump it dry snd ascertain the amount of infiltration, which hitherto has been small, and of spring water only.

The daily progress of the borings through the upper strata averaged from 50 to 60 centimeters; since reaching the gray chalk (*craie de Rouen*) the rate has increased from 82 to 100 centimeters daily; the greatest progress made in any single day was two meters, 50 centimeters in 22 hours. Now that a softer stratum has been reached, progress will be more rapid, and a faster, though less powerful machinery has recently been substituted for that at first used.

The Hoosac Tunnel.

This great engineering work is complete. According to the *Railway Review* the first passenger train passed through the tunnel July 8, 1875. The road was then formally opened, but so much work remained to he done that it was not ready for actual use until July 17th. During the past year the tunnel has been enlarged aud arched, and the road from Greenfield to North Adams rebuilt, making it very substantial. Trains have only run at night, that the work might not be interrupted. An average of 100 cars of Western freight has been carried eastward daily, but a single mixed train has taken all the passengers between Greenfield and North Adams without reference to connections with other roads. The tunnel and the picturesque Deerfield valley will attract many summer visitors, and it will daily become more of a thoroughfare. Passenger trains run through the tunnel in 18 minutes, while 30 are allowed for freight. A telegraph station is established at each entrance and but one train is allowed in at one time. When the business of the road shall require it, another telegraph operator will he stationed at central shaft, and two trains he allowed to pass through at the same time. Three passenger trains each way will be run for the present between Boston and Troy every day except Sunday.

The central shaft, which was built at an expense of upwards of a million dollars and 20 or more lives, was originally intended as a third point where the work of excavation could be carried on and afterward serve as an immense chimney, through which the smoke and bad air of the tunnel would be taken off. The shaft itself was only completed a few years before it was overtaken hy the work from the western entrance of the tunnel, so that the temporary advantage it gave cannot be said to be in proportion to its cost. Experience has proved that the rush of air occasioned by the speed of trains affords sufficient ventilation, and that the shaft was an actual disadvantage. It has therefore been entirely closed near the surface of the mountain.

A NEW WAY TO MAKE A GLASS ROOF.—Rendle's system of glazing described in *Engineering*, consists of a series of zinc bars of pot-hook section, with a return bend; the bars being screwed to the purlins. The top bar is simply of pot-hook section, and the bottom bar, the same section reversed. The glass rests in the groove of the lower bar and in the back groove of the intermediate and upper ones, in which it has full vertical play. The panes lap each other; no water can penetrate the roof (as was tested by a fire hose); water from the inside is carried down by the grooves; the panes are rigid, although readily fixed and replaced. At Paddington there are 15,000 square feet under roof, and Mr. Rendle is under contract to cover several more large stations.

[From Mechanics' Fair Daily.]

A Lay from the Lathe.

EDITORS FAIR DAILY:—I saw a piece in your paper the other day signed "Cold Chisel," and I will say that it was the first piece of cold chisel work which ever deserved to be seen. I have a rather poor opinion of Cold Chisel. He is generally little more than a makeshift and I am glad he has risen above himself and chips off some pretty good sense. As you seem to be willing to hear us workers on our own behalf, I propose to "chuck" the subject of improving our work and "turn off the scale coat" if I don't get any deeper.

Your correspondents speak of the advantages of the fair for improving work. This is true, but I am surprised that more workmen do not come forward with their specimens of good work. We ought to have long benches filled with "pieces" prepared merely to show the toolcraft on them. These might not be more interesting than a basket of chips to the common observer, but to the practical worker they would be full of meaning and worth long study. Mechanical ideas travel slowly by talk. Workmen are generally too tired of the shop to discuss such things when work is over; and then it is pretty hard to talk up a thing unless you have the work to show for it. But if we had a good bench full of samples of the finest work that can be done with lathe, planer, grindstone and emery, it would be as valuable to us to examine as a case of insects would be to a member of the academy or a picture gallery to an artist. This would be working for ourselves. Of course workmanship shows in the finished machines, but the credit goes to our employers. Besides this the work on a finished machine may be made up a by a hundred hands and it is impossible to get the credit for the actual work where it really belongs.

It seems to me it would be a good plan for a mechanical exhibit, to have the hands in some shop take hold and lay out a machine among themselves and then each man work up the part which he is best at. I would then have the machine laid out in the fair, each part by itself. I would begin with the drawings and specifications, then the patterns, then the castings and forge work, making all parts of casting or forge work in duplicate, so that each can be laid beside the perfectly finished piece as it comes from the machinist. Then we should have an original sort of a show of practical mechanism. These parts would all lie each by itself, with its bolts and connections complete. I warrant you that show would be studied by every mechanic in the city. The excellence of the work would show for itself; not only would the polished and lacquered metal appear and all the joints be made and covered, but the style of castings which are furnished to the machinist would be discovered, as would also the quality of the pattern which is furnished to the molder. It is pretty generally known that each preceding workman has a good deal of influence on the work of the man who follows him. The pattern maker can fill a "flask" with "rats," in spite of the finest molding, if he does not give the molder a good pattern, and the puddler can send the machinist to the grindstone every five minutes if he makes a wrong mixture. The finished machine does not tell all these secrets of the shop, but if a machine should be made in duplicate, as I have said, in finished and unfinished parts, a skillful workman could tell where the greatest credit for the work belonged.

I would have this machine laid out there in the fair a certain number of days, so that it could be thoroughly studied for its workmanship; then I would advertise that on a certain evening it would be set up and put to work; of course every part should be perfectly fitted beforehand, and an hour or two would suffice to set it up. I warrant you you would have a larger audience than the band on the night that it was done.

You may say that I am "cutting" a pretty "coarse thread" on this subject. Well, I will change my "gear" and cut down the "feed" a little. I think a mechanic needs no better proof that actual work is a good thing to show than he can get at the fair this year; the trouble is that there is not enough of it. The lathe is well represented in a piece of shafting which lies on a table near the main engine. This will do for a sample of the heavier work and the heavier material. There ought to be 20 specimens of iron turning, from the main shaft of a steamer down to the smallest governor balls. The light work of the lathe is well shown by those two enterprising wood turners who have their beautiful work spread out not far from the office of Dewey & Co.'s *Fair Daily*. I think the lathe ought to have done ten times as well for the fair, and yet I am proud to see that the lathe outstrips all other tools in showing its work. Where are you, slow-going "planer," that you have not matched your straight lines against my curves? Where are you, rattling "drill," that you have not worked through the subject of workmen's exhibits instead of waiting for me to work around it? Where are you, all useful tools, that you have not shown the public your claim to honorable existence?

Well, Mr. Editor, while I have been "centering" this piece for you my "tool" has fed into the "tailblock," so that I run my pen on to the "loose pulley" and quit for this time.

THE LATHE.

USEFUL INFORMATION.

The Game Law.

As the game season approaches, much interest is felt by sportsmen to learn the changes in the laws with regard to killing game that were effected by the last Legislature. The new sporting journal, the *Pacific Life*, gives the following synopsis of the laws on this subject as they now stand, which will no doubt be found to be correct:

The close season for salmon commenced August 1st and extends to November 1st. Under the law passed at the last session of the Legislature it is made a misdemeanor to catch, transport or have in possession fresh salmon during this period. The penalty for a violation of the law is from $20 to $200, and this is divided between the informer, the prosecuting attorney and the school fund of the county.

Every person who, between the first day of January and the first day of September of each year, takes, kills, or destroys any elk, deer, mountain sheep or antelope, is guilty of a misdemeanor; and every person who shall take, kill or destroy any of the animals herein mentioned, at any time, unless the carcass of such animal is used or preserved by the person slaying it or is sold for food, is guilty of a misdemeanor. Any person catching or having in his possession, or offering for sale, shad, at any time prior to the first Monday of December, A. D. 1877, is guilty of a misdemeanor. The following counties are excepted from the provisions of this section: Del Norte, Humboldt, Shasta and Mendocino.

Section 626 of the Penal Code was amended last winter to read as follows: Every person who, in the counties of San Bernardino or Los Angeles, between the first day of April of any year and the first day of August of the same year, or who in any other of the counties of this State, excepting the counties of Lassen, Plumas and Sierra, between the fifteenth day of March and the fifteenth day of September, in each year, takes, kills or destroys quail, partridge or grouse, mallard, woodteal, spoonbill, or any kind of broadbill ducks, is guilty of a misdemeanor.

Section 631. Every person who, between the fifteenth day of October in each year and the first day of April in the following year, takes or catches any trout, is guilty of a misdemeanor.

Section 632. Every person who, in the counties of Santa Clara, Alpine, Santa Cruz, Lake, San Mateo, Monterey, Sonoma, Tuolumne, Alameda, Marin, Placer, Nevada, Plumas, Sierra, San Luis Obispo, Solano, Mariposa, Mendocino or Napa, at any time takes or catches any trout, except with hook and line, is guilty of a misdemeanor.

Section 633. Every person who takes, catches or kills any trout by the use of nets, weirs, baskets or traps, is guilty of a misdemeanor.

The penalty for the violation of the law is as follows: Except in cases where a different punishment is prescribed by the Code, every offense declared to be a misdemeanor is punishable by imprisonment in a county jail not exceeding six months, or by a fine not exceeding $500, or by both.

The Board of Supervisors of Santa Cruz county, at their meeting on the first Monday in August, changed the deer law so that hunters may kill deer from the 15th of August to the 1st of January, instead of (as heretofore) from the 1st of September to the 1st of January.

Things Worth Knowing.

Keep tea in a close chest or canister.

Keep coffee by itself, as its odor affects other articles.

Keep bread and cake in a tin box or stone jar.

Cranberries will keep all winter in a firkin of water in a cellar.

Oranges and lemons keep best wrapped in soft paper, and if possible laid in a drawer.

Scaled herrings should be fat fish, free from scales, and when smoked he of a bright golden color. No. 1 herrings are generally small and poor fish.

Salt—Ashton's, Marshall's and other Liverpool brands come in bags, 224 pounds; New York State in barrels and bags, 240 and 280 pounds; cases of table salt contain 60 boxes, about 2 pounds each. Salt also comes in small packets, put up in sacks, three sizes: 25, 10 pound packets; 40, 6 pounds and 80, 3 pounds.

Gunpowder is a heavy tea of a dark green hue, and the leaves rolled in hard balls.

Twankays are known by the large, yellowish, badly rolled leaves and strong odor. The infusion is a deep yellow, and of clear, sharp taste.

Mackerel comes in barrels, half-barrels, quarter-barrels and kits, containing, full weight, respectively, 200, 100, 50 and 20 pounds.

THE VARIOUS KINDS OF CAMPHOR.—Ordinary camphor comes from Japan or the island of Formosa, but there are various highly esteemed species of camphor obtained from Borneo and Sumatra. There is also another variety of medium quality produced by the *Blumea balsamifera*, a plant of the composite order, which grows in the east of Asia. The Chinese denote it by the name Ngai, and make use of it in medicine and the manufacture of ink. It produces harder and more brittle nuts than the laurel camphor. Like this latter, it is sublimed at an ordinary temperature, but less easily, while the Borneo camphor does not show any traces of sublimation even after several years. All camphors float in water, but when the air in the interstices is exhausted by an air-pump, Ngai and Borneo camphor sink to the bottom, while the laurel camphor swims. The specific gravity of laurel camphor is .995 that of Ngai 1 02, and that of Borneo 1.011. Laurel camphor melts at 335 deg. Fahr., Ngai at 509 deg., and Borneo at 405 deg. Laurel camphor, washed with hydrochloric acid and still moist, quickly changes to a colorless liquid. In the same circumstances Ngai and Borneo absorb the acid very slowly, and do not turn to a liquid till long after. Nitric acid changes Borneo camphor into an oil, which, on the addition of water, deposits a substance identical laurel camphor. The same thing occurs with Ngai.—*The Laboratory.*

How Wounds are Produced.

Many cases are coming up continually before coroners and coroners' juries which require judgment to be pronounced on the probable cause of death wounds.

Dr. William Macewen, in the Glasgow *Medical Journal*, gives a careful study of 71 cases, including 104 wounds, produced by 51 different articles. He concludes:

1. Blunt instruments sometimes produce scalp wounds having straight outlines and sharp clean edges, which in these respects could not be distinguished from the wounds produced by sharp cutting instruments.

2. Scalp wounds, which exhibit entire hair bulbs projecting from the surface of their sections, have been produced by blunt instruments.

3. Wounds exhibiting nerve filaments, or minute blood vessels bridging the interspace between the lips of the wound toward the middle of the depth of the section, while the tissues have receded all around them, below as well as above, have been produced by blunt, non-penetrating instruments.

4. When a wound, even with sharp, well-defined margins, bears in contour a resemblance to an osseous ridge in close proximity, there is a *probability* that it was produced by a blunt instrument, through forcible impact against the underlying osseous ridge.

5. *Cut* hairs found in the immediate vicinity of a wound are valuable aids in determining whether a sharp or blunt instrument has been made use of.

6. As to the diagnosis between wounds produced by instruments of the knife kind and other sharp-edged substances, such as glass, earthenware, etc., no dependence can be placed on the mere regularity of outline or sharpness of edge, or the reverse.

7. Sharp, clearly defined wounds, in certain cases, present peculiarities in their termination which may be sufficient to enable a probable diagnosis as to whether they were produced by a knife or portion of glass or earthenware.

8. The same instrument used by the same person in delivering several successive blows may produce wounds of different characters.

WOOL GREASING.—A Mr. Lebrun mentions, in a German paper, that a considerable quantity of oil may be saved by the following process of oiling wool, besides insuring a more uniform and regular web, on account of the woolen fibers loosening and separating themselves more easily from each other. Moreover, this plan, it is said, is not open to the objectionable features of some processes, which sometimes cause the total disappearance of fine color dyes; and the cards wear longer and better, besides allowing the wool to be more easily and economically cleaned. To obtain this preparative, pour into a wooden trough 20 parts oil, with 10 parts liquid ammonia, adding five parts of water. Stir up this liquor with a wooden spoon, and, by inserting a steam pipe, allow the same to boil until the strong smell of ammonia has evaporated, after which the oiling or greasing may be proceeded with in the usual manner.

GOOD HEALTH.

Remedy for Small-Pox.

Small-pox is epidemic in Southport, England, at present, as it is here, and Edward Hine, a Wavertree correspondent of the Liverpool *Mercury*, sends the following to that paper, and the recipe which it contains may be of service to the suffering in this city:

No disease is so repulsive as the small-pox, and none so generally dreaded. It is well known that it is much about our town and suburbs. I am willing to risk my reputation as a public man if the worst case of small-pox cannot be effectually cured in three days, simply by cream of tartar. This is the sure and never-failing remedy.

One ounce of cream of tartar dissolved in a pint of boiling water, to be drunk when cold, at short intervals.

It can be taken at any time, and is a preventive as well as a curative. It is known to have cured in a hundred thousand cases without failure. I have myself restored hundreds by this means. It never leaves a mark, never causes blindness, and always prevents tedious lingering. It is so effectual that if popularly used would dispense with the unnatural law of vaccination and the costly staff of vaccinators, for small-pox never appears without a need, and then ought to be purifying and healthful to the system; and when capable of being so quickly removed need never be feared above a cold or an overflow of bile.

Like the identity of the British with lost Israel, it is too grand, too simple, and too good to be quickly accepted by the people; and the doctors, as the ministry to the identity question, laugh at the remedy, because it interferes with the old routine of their customs, and has not emanated from themselves. Nevertheless, if the people would only try it, and report all the cures to you, you would require to employ many columns if you gave them publicity.

Unwholesome Ice.

There is danger in ice from impure water. The evidence we find in a recent report to the Massachusetts State Board of Health, by Dr. A. H. Nichols, concerning the outbreak of an intestinal disorder among the guests at one of the hotels at Rye Beach in the summer of last year. The symptoms were those generally following a derangement of the digestive system; such as nausea, giddiness, loss of appetite, diarrhea, abdominal pain and fever. With about five per cent. of the guests, these symptoms were grave and persistent; among the great majority, and notably with children under ten years old, there was no such illness, and there were no traces of it at the other hotels and in the cottages at Rye Beach. The sewerage of the hotel was first carefully investigated, and then the water supply, the proprietors of the hotel lending eager aid to thorough research; even the kitchen and its processes were overhauled without finding the cause of trouble. At last it was discovered in the ice with which the hotel was supplied. This had been procured from a pond of which the outlet had in recent years been closed by sand and stones which shed up from the sea, the pond thus becoming a stagnant receptacle of mud and sawdust, there being two sawmills on the stream above. The ice was subjected to chemical analysis, and was found to contain putrescent vegetable matter. The hotel stopped using this contaminated ice, and there was an end to the sickness among its boarders. The report concludes by mentioning that there is a common but quite mistaken popular notion that when water freezes its impurities are somehow excluded from the ice. The moral is so obvious that it need not here be stated; but in a general way it may be worth while to summarize the fact that water which is not perfectly fit to drink is unsuitable for an ice supply.

SEA SICKNESS.—As everything relating to sea sickness is of interest in these days of travel, we give for what it is worth the gist of a letter recently printed in an English scientific journal: "Many years ago I had frequently to cross the Irish channel, and was invariably sick if there was the least motion in the water. Once when it was very rough, and the wind blowing a hurricane, in some unaccountable way I hit luckily on an expedient which for me, at least, is an effectual preventive, and I should like it to be tried by others. For what reason I cannot say, but I made my respiration coincide punctually with the heave and fall of the vessel. As she rose I inspired slowly and regularly, and as she fell I expired, and the effect was so completely successful that I several times fell asleep. But each time (I suppose because the breathing was no longer synchronous with the vessel's movements), I was awakened by sensations of sea-sickness, which two inspirations and expirations, as above described, immediately dispelled, and I completed a very rough voyage with comparative comfort. I have sailed since, though not on a very rough sea, and have been able to walk the deck and enjoy the voyage. My inference is that sea-sickness is caused by the heavings and falls of the vessel crossing the motions and operations of the diaphragm, which unseasonably presses on the upper stomach and liver, and so disorders their functions."

COLORS FOR CONFECTIONERY AND FOOD.—The police of Paris have directed that the following substances be employed for coloring articles of food or confectionery: Blue: indigo and its derivatives, Prussian blue; red: cochineal, carmine, Brazil wood, lake orchil; yellow: saffron, Avignon yellow berry, quercitron, fustic, turmeric; green: mixture of Prussian blue and logwood (Campeachy wood); violet: mixture of carmine and Prussian blue.

The use of the following pigments is prohibited: oxide of copper, blue copper salts, red lead, vermillion, chrome yellow, gamboge, white lead, Schweinfurt and Scheele's green (Paris green).

For coloring drinks they recommend Curacoa logwood; for absinthe, soluble indigo blue with saffron; for blue liquids, soluble indigo blue, Prussian blue and ultramarine.

We notice that, singularly enough, aniline colors are omitted from the list of prohibited colors.

EUCALYPTUS GLOBULUS IN PULMONARY GANGRENE.—Of all the drugs employed by Dr. Bucquoy (of Cochin hospital, Paris) in pulmonary gangrene, none, he asserts, have given him better results than *Eucalyptus Globulus*. He uses it in the form of an alcoholate—two grammes (half a drachm) daily in a mixture of water, gum, orange-flower water and syrup. Out of the various cases he has had under his care at Cochin, five ended in cure, whilst in all the others there was a favorable modification of the odor of the breath, the sputa and the violent cough, after carbolic acid had failed.—*Druggists' Circular.*

MINING AND SCIENTIFIC PRESS.

Half inch (1 square)...	$1.00	3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

Our latest forms go to press on Thursday evening.

San Francisco:

Saturday Morning, Sept. 9, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Levake's Improved Car Wheel; A Successful Home Industry; An Improved Machine for Punching and Cutting Metals, 169. A Notable Railroad Connection; California's Birthday; Combined Ore Feeder and Crusher; Gems and Precious Stones, 176. The Centennial at Philadelphia, 177. In the Mountains; Asbestos; Notices of Recent Patents; Lap-Welded Water Pipe, 180. Patents and Inventions, 181.

ILLUSTRATIONS.—Levake's Improved Car Wheel, with Section of Car Wheel for Turning Curves, 169. Horticultural Hall, 177.

CORRESPONDENCE.—Mines of Humboldt and Lander Counties, Nevada; Facts About Peat; Gold and Silver Mining, 170.

SCIENTIFIC PROGRESS.—A Veritable Salamander; A New Nickel Ore; Shooting-Stars; How Spontaneous Combustion may Occur; Prizes Offered by the Netherlands Scientific Society, Haarlem, 1876, 171.

MECHANICAL PROGRESS.—Fine Points in Mechanism; A New War Vessel; Underground Telegraph Lines in Paris; Points About Grinding; Hardening Steel with Mercury; A Crane to Lift 160 Tons, 171.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 172.

MINING SUMMARY from various counties in California, Nevada and Idaho, 173-74-80.

THE ENGINEER.—The Colossa of New York; Lesseps' New Scheme; An Engineers' Institute in China; The Work in the Channel Tunnel; The Hoosac Tunnel, 174.

USEFUL INFORMATION.—The Game Law; Things Worth Knowing; The Various Kinds of Camphor; How Wounds are Produced; Wool Greasing, 175.

GOOD HEALTH.—Remedy for Small-Pox; Unwholesome Ice; Sea Sickness; Colors for Confectionery and Food; Eucalyptus Globulus in Pulmonary Gangrene, 175.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 181 and other pages.

MISCELLANEOUS ARTICLES.—Mathematical Instruments at the Fair; Photo-Printing on Wood Blocks; Saving in Long Runs; A New Way to Make a Glass Roof, 174. A Lay from the Lathe, 175.

NEW ADVERTISEMENTS.

Mines and Mining Lands Bought and Sold, American Mining Agency, Philadelphia, Pa.; Water Tanks, Wells, Russell & Co., S. F.; Kearsarge Con. Quicksilver M. Co.—Sale.

W. B. MURDOCK, of this city, in speaking of the new mining board in New York, suggests to us the query: "Why not a mining board in Chicago? For energy and speculation its business men have a most favorable and world-wide reputation. The successful organization of the New York board would be an incentive to the formation of one in Chicago. For companies formed on properties of merit with a view of legitimate operations, the larger the field for the disposition of its securities, the better for the development of the mining and all other interests on this coast, which would be benefited thereby."

JET.—In answer to a correspondent who asks us the price of jet, we may say it varies in price. If he will send us a sample we can answer more definitely as to the value of what he has.

ON FILE.—"Some of the mines of Reese River District," "Notes from the South Yuba," "Facts about Peat," "Alta Mine and its Prospects."

MR. ROYALL, of Hornitos, Mariposa county, has left us a sample of ore which he supposes to be telluride of silver. It is, however, altaite.

THE California society for the prevention of cruelty to children has been organized by some of our prominent citizens.

THE Ventura oil refinery was started up for the first time this week. This is another important industry for this coast.

A Notable Railroad Connection.

Engineering on the Southern Pacific Railroad.

The event of driving the last spike in the railroad connection between San Francisco and Los Angeles, which occurred on Tuesday last, was one of great importence, indicating as it does the gradual opening up of southern California, Arizona, etc., and bringing them into more direct communication. The road passes through the San Joaquin valley, from Lathrop in the north (where the line branches from the Central Pacific), to Tehichipa, a distance of 300 miles, on almost a level. The work of track-laying was comparatively inexpensive, with bridges crossing the Stanislaus, Tuolumne, Merced, Fresno and Kern rivers, and other streams flowing from the mountains to the San Joaquin. The San Joaquin Valley railroad, which comprises this section of the road, intersects the counties of Stanislaus, San Joaquin, Merced, Fresno, Kern and Tulare, and all the products of Tuolumne and Mariposa counties will find their way to market on this great highway.

The only natural passes across the barrier separating Los Angeles from San Francisco are the Tehichipa and Tejon passes, the former of which was chosen by the railroad engineers as the easier through which to run their track, and from there it debouches into the Mohave desert. These were not the only obstructions to be overcome, and the San Fernando tunnel, the longest on this side of the continent, had to be bored, and the work was performed with more then ordinary expedition.

San Francisco is now placed in communication by rail with Los Angeles, San Bernardino, Santa Monica, Wilmington, Anaheim and Santa Ana. Los Angeles is now the center of an extensive railroad system, branches extending to Santa Monica, Wilmington and Anaheim, besides the main trunk of the Southern Pacific railroad, which runs through it. The branches extending to Wilmington and Anaheim are owned and controlled by the Southern Pacific railroad company; that to Santa Monica is the nucleus of the Los Angeles and Independence railroad. All that remains of the Southern Pacific railroad to be built is from Indian Wells to the Colorado river, at or near Fort Yuma

The engineering difficulties in building this road were very great, and those encountered in ascending the Tehichipa canyon surpass anything encountered on an equal distance in the Sierra Nevada. Every artifice had to be employed to enable the engine to climb the steep grade, and within 19 miles there are 17 tunnels in ascending the Tehichipa. A few statistics regarding the length and size of these tunnels cannot prove uninteresting. Tunnel No. 1 is 245 8-10 feet long; No. 2, 232 2-10 feet; No. 3, 707 7-10 feet; No. 4, 257 feet; No. 5, 1,156 3-10 feet; No. 6, 303 7.10 feet; No. 7, 532 7.10 feet; No. 8, 690 feet; No. 9, 426 2-10 feet; No. 10, 406.6 feet; No. 11, 158.8 feet; No. 12, 756 3 feet; No. 13, 513 8 feet; No. 14, 512.7 feet; No. 15, 360.7 feet; No. 16, 262.5 feet; No 17, 260.9 feet; making a total of 7,683.9 feet. Nearly all these tunnels are heavily timbered with stanch 11x14 inch redwood timbers. At the bottom they are 14 feet in the clear, or 16½ feet in excavation. They are 22 feet in hight, and the shoulders at the springing of the arch are 18 feet 4 inches. In the Soledad canyon there are two more tunnels, numbered 18 and 19, the first being 264 feet long, and the latter 332 feet. The longest tunnel on the coast is the San Fernando tunnel, 6,966½ feet in length.

This triumph of engineering skill was commenced on March 27th, 1875, the headings met July 14th, 1876, and the timbering was completed August 9th, 1876. It is build on a slope of 37 feet to the mile, and is perfectly straight, so that one can see through it. It is not cut through a single mountain, as is the case with most undertakings of this kind, but runs through a succession of ridges and canyons. The entire length is 6,966 feet, or nearly a mile and a quarter. This is exclusive of the heavily-graded approaches, which aggregate half or three-quarters of a mile more. The deepest point in the tunnel is 600 feet below the top of the mountain. The excavation is made in the form of a trapezoid, only that the top which forms the longest side of the figure is surmounted by an arch. The width of the bottom is 14 feet, the hight of sides to the commencement of each, 16 feet, and the height to center of arch 21 feet. The sides and top are protected by heavy timbers, braced, fitted and spiked into the aperture as soon as the earth is removed. The south approach ascends at a grade of two feet in 100, until it reaches the mouth of the tunnel, where the road-bed strikes a uniform gradient of 71-100ths of a foot in 100, rising toward the north. At the northern extremity it reaches its highest point, and then descends with the same incline as the southern approach. Work was commenced simultaneously at both ends, and at three intermediate points on the line of the tunnel. From these points inclines were sunk to the level of the road-bed to further the work of excavation and provide ventilating facilities when the tunnel was completed. The tunneling was originally started some distance from the present face, but the overlying earth caved in so badly that it was found necessary to make excavations about sixty feet deep before sufficiently solid earth was found. Another obstacle which presented itself was an excessive flow of water, rendering the work of excaveting not only dangerous but very expensive.

Tunnel 9 is at the famous loop of Tehichipa pass. This loop completely encircles a mound and by so doing gains a difference in elevation of 77 feet 46 inches. Emerging from tunnel 9, the train winds around the mound and passes directly over the tunnel at right angles, having made a curvature of 300 fast 52 inches. The length of the loop is 3,794 feet. Pictured on the map this loop looks like a coil thrown carelessly in a rope; it is a veritable corkscrew. It is claimed to be a novel and original achievement in engineering. The total length of tunnels between Caliente and Los Angeles, as given above, is 15,246 4 feet.

The road has been built to within 100 miles of the Colorado river, which it will reach before the close of the year. The whole distance from here to Fort Yuma by the road is 715 miles, over 600 of which are completed. The last spike in the connection was driven by Charles Crocker. It was made of Los Angeles county gold. Appropriate ceremonies participated in by the railroad directors and prominent citizens from Los Angeles and San Francisco where held. A banquet was given, toasts offered and speeches made. Trains leave here now daily for Los Angeles at 4 P. M., arriving at Los Angeles the next day at 3:30 P. M.

California's Birthday.

The 9th of September is an important day in the history of California, since, on that date, in the year 1850, the State was admitted into the Union. It was ceded by Mexico to the United States in 1848, but so rapid was its progress that in two years it became a full-fledged State. This rapidity was mainly due to the discovery of gold, which attracted thousands of adventurous spirits to the new El Dorado. A State government became soon necessary, from the confusion attendant on the existence of the old Spanish laws, by which the property and affairs of the settlers had hitherto been settled. Shortly after the formation of a State government, however, everything went on smoothly enough, with the exception of the trouble caused by the Mexican land grant system, the evils of which are yet felt.

Californians can look back with pride and gratification at the progressive record left since their State joined the sisterhood of States. Previous to the occupation by Americans, the fair valleys, productive hills and boundless forests were comparatively useless to the meager population which was scattered over the land. In few instances was the soil tilled at all. Mines were unknown, and the principal industry—if so it can be called—of the people, was in tending the flocks and herds which roamed at will over the broad territory so soon to be subjected to the implements of the miner and farmer. The few short years intervening between the discovery of gold and the admission of California as a State wrought a wondrous change. The adventurous, energetic Americans came in numbers and roused the lethargic, conservative natives from their sleep of centuries, showing them the hidden wealth of the land and completely changing the customs, laws and everything else from what it had been. They speedily scattered into every corner of the State, each unearthing some new product, cultivating the land and digging down into the bowels of the earth in search of nature's hidden treasure.

The result of these labors is seen to-day. A proud city whose ships go to every quarter of the world, whose merchants trade with all nations, and whose manufactories furnish necessaries to the whole territory west of the Rocky mountains. A city beautiful in architectural adornments built on a site which twenty-five years ago was a waste of sand, one which ranks in wealth and population with the large cities of the world and which bears the reputation of a material progress more rapid than history speaks of. Hundreds of thousands of acres under cultivation by an industrious agricultural population, thousands of mines being worked in every direction, manufactories for the utilization of raw material built, and evidences of thrift and prosperity of the people on every hand.

From our abundant wheat crops we have enough to spare to employ hundreds of ships in carrying it to the marts of Europe to feed the people there. The capabilities of the soil having been proven, we raise grains, fruits, vegetables, etc., nearly every imaginable variety and more than we want ourselves. Our mines have produced since their discovery upwards of $1,143,000,000 in gold and silver, and the value of our agricultural products no man can compute. Our manufactories, though few as yet, are prosperous and increasing. We have within the State upwards of 1,500 miles of railroad, while steamers and vessels navigate our streams in all directions. The State not only supports its own population, but is sufficient of a producer to send a variety of things to those outside its borders.

All this we see has happened within a quarter of a century, and still we progress. California is to-day in a more prosperous condition than any State in the Union. The people are well-to-do, and what is more, we have room for many others to come and prosper too. Those who have come to us within late years may not see the steps which have been made so plainly as those who have resided here long, but still they can see enough to prove that Californians have something to be proud of in the advanced and progressive position of their State.

Combined Ore Feeder and Crusher.

Mr. James Tulloch, of Oakland, inventor of the well-known "Tulloch ore feeder," has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency, a combined machine for crushing and feeding ores to stamp mills. While the work done by ordinary rock breakers or ore crushers is sufficient to reduce the ore into pieces which can be fed to stemp mills, the size of the pieces is by no means uniform, some of them being so large that they receive the blow of the stemps two or even three times before they are sufficiently reduced to allow the stamp to act upon any of the smaller pieces in the battery. And while a small piece of ore can be pulverized much more readily by the action of stemps, large pieces can often be broken into smaller fragments more readily by reciprocating jaws; and when pieces of ore of uniform size are fed to a battery the work of the stemp is greatly facilitated, and the wear and tear upon the machinery is reduced.

The invention provides a combined ore crusher and feeder in which the large pieces of ore are reduced to a uniform size before they are fed to the stamps, and as the inventor can utilize the drop of the stamps with better effect for reducing the large pieces of ore to a uniform size between reciprocating jaws than under the stamp, he saves materially in the time required to crush a given quantity. The ore is placed on the hopper of the machine just as it comes from the rock breaker. Surrounding the lower end of the hopper, and projecting a short distance below it, is secured a combined rock breaker and feeder, which receives the ore as it descends by gravity from the hopper, and which will reduce the larger pieces to a medium size before dropping it into the stationary chute.

The combined crusher and feeder consists of two jaws. One jaw encircles the sides of the lower end of the hopper, while the other jaw forms the front side. The upper portion of this crusher conforms to the hopper shape of the lower portion of the hopper, while the lower part of the rear jaw curves forward. Both jaws have transverse teeth on their inside faces. The operating lever receives its motive force from the blow by the tappet of the stamp. The rear end of the lever is formed into a square frame which surrounds the crusher. The front jaw is hinged to the front part of the frame, and the rear jaw to the rear part, while the frame itself is suspended on journals midway between the jaws, so that the up and down motion imparted to the extremity of the lever will cause the jaws to reciprocate. The opening through which the ore is delivered from the crusher to the stationary chute is regulated according to the size required to produce the desired size of ore.

It will thus be seen that the crusher receives the ore from the hopper, sizes and delivers it to the chute, which directs it into the battery. The plain reciprocating jaws, similar to the above described crushing jaw, could be used for simply feeding the ore from the hopper without crushing.

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

N. Malachite.

Melachite, although not a precious stone, is highly prized for ornamental purposes. It generally occurs in mammillary concretionary masses of a beautiful green color. It has an uneven fracture, splintery or conchoidal, opaque; luster, dull; color, emerald green, sometimes in bands or stripes of different shades; does not scratch glass; takes a high polish; streak, lighter color than the mineral. When pure, it has the following composition: Protoxide of copper, 71 9; carbonic acid, 19.9; water, 8.2. Total, 100. Specific gravity = 3.7 to 4; Hardness = 3.5. Seldom found crystallized; crystals, monoclinio.

B. B. decrepitates and bleckens; with borax, yields a bead of copper. Effervesces with nitric acid, giving a green solution, which becomes blue on adding an excess of ammonia. The powdered mineral, after wetting with hydrochloric acid, imparts a blue color to blowpipe flame.

The ancient name for malachite was "molochitis," which was derived from the mallow, which it was observed to resemble in color. It was highly esteemed, according to Pliny, for making seals and for its medicinal properties, "which render it a preservative for infants from certain dangers which menace them."

Malachite is abundant in a few localities. In the Urals, in the Burra Burra mines, Australia, at Bembe on the west coast of Africa. Dana gives the Hughes mine, in Calaveras county, as a locality. Although there are many localities on the Pacific coast where it occurs in small quantities, I do not know of any which produces specimens of any value for ornamental purposes.

There is a slab of melachite at St. Petersburg 32 inches long, 17 inches broad and 2 inches thick, which is valued at 30,000 francs. Whole rooms in several European palaces are lined with malachite. Mantel pieces and table tops are not uncommon. There are fluted Corinthian columns of malachite in churches in St. Petersburg. It is used extensively in inlaying marble and other ornamental stones, for clocks, vases, statues and other ornamented work, but is seldom worn as jewelry.

[Editorial Correspondence.]

The Centennial at Philadelphia.—No. 14.

Terraced npon a little eminence, near the center of the Centennial gronnds, and commanding a delightfal view of the same and a portion of the city and Schuylkill river, stands an elegant stractnre—a sort of Moorish palace, constructed after the style of ths twelfth century, flanked npon either side with arches of glass, and glistening all over with that material and varions colored brick and iron work. The location is qnite romantic. A deep and thickly wooded ravine near by is spanned at a little distanoe by an ornamental bridge, 500 feet long, while still nearer, the same ravine is crossed by a single rail railroad track, across which rons, every five minutes, a novel two-story car. This structore is known as

Horticultural Hall,

And is reckoned as one of the five great maiu buildings of the Exposition. Although comparatively small in extent, many think it the most beautifnl of all, and it will remain as a permanent ornament to Fairmount park. A very good idea of its general appearanoe may be formed from the view given in the accompaaying illnstration. The leagth of the hnilding is 383 feet; its width, 190 feet, and its hight, 70 feet. It covers an area of about one nad a half acres. The two main entrances are throngh imposiag doorways, aud are beautifully ornamented with tile and marble work. The central portion of the building consists of a large hall or conservatory, arannd which runs a corridor, also of Moorish construction, and some 20 feet high. A colossal terra cotta statne of Diana, the goddess of the woods and the hunt, guards the principal entrance. A msgoificent fountain decorates the center, whioh, by the spray wafted from its falling jets, greatly modifies the overheated and sickening atmosphere rendered necessary to keep in a healthy condition the rare exotics which are gathered here from almost every tropical region of the globe. The angles of the main hall are adorned with smaller fountains, while many pieces of elegant and appropriate statuary, intorspersed here and there among the gay flowers and rich shrubbery, adorn other portions of the hall. Here, in this fairy-like palace, Flora is enthroned and holds nadisputed sway.

The grounds immediately snrrounding and oonnected with hortionltnral hall are about 40 acres in extent, and are specially devoted to horticnltural pnrposes. They are beautiful in topography, gently nneven, tastefully and artistically laid out, and divided into scores, if not hnndreds, of little parterres, separated by asphaltnm avenues and walks of greater or less width and length. These parterres are covered with an immense number and variety of flowers from bulbs, shrubs and seeds, judiciously relieved by borders and patches of living green. At one time there were here over 30,000 hyacinths in foll bloom. Flowering shrubs are seen in great variety, spring blossoms without number, thousands of roses, beautiful and rare evergreens and trees and plants—such as may be grown in our summer atmosphere—from all parts of the world. Here England has been allotted 43,000 square feet of space; Germany, 10,000; Spain, 6,000; the Argentine Republic, 5,000; France, 3,800; and the Netherlands, 200 feet. The view of these flower-beds upon either side, looking down the broad walk from Belmont avenne—horticnltural hall closing the vista—is said to be the finest one of the kind in the world.

Within this floral temple, and npon the surrounding grounds, the science of horticnltnre is illnstrated in the following order and classification: Ornamental trees, shrnbs and flowers, hot-houses, conservatories, graperies and their management, garden tools and accessories of gardening, landscape gardening, designing, construction and management.

The Interior of the Hall

Is a fairy palace indeed, the floral display in which it is difficnlt to describe. Nowhere else on this side of the Atlantic, can the visitor behold such a collection of the wonders of floricultnre. The vestibnle leading to the entranoe is devoted to the exhibition of garden implements, such as pruning knives, spades, hoes, rakes, etc., all glistening in high polish. There is also here a fine collection of fancy woods and hanging baskets. On either side of the centrnl hall are the forcing houses, which are well filled with plants that reqnire special care and warmth previous to their being transplanted to the places where they are to bo seen aad studied as standard representatives of their kind.

Passing to the interior of the hall we behold rare exotics from the burning climes of Africa and Sonth America, the twisted and thorny cacti from the plains of Lower California and Mexico, and stately palms and gigantic ferns from islands on the Pacific ocean. Prominent among the latter are the palm ferns from the gardens of Messrs. Miller & Sievers, of San Francisco. The broad fan palm, suggestive of summer heat, is also here, and the sago and guava plant, the date and the cocoa tree and the banana, with its cluster of fat and luscious fruit. Here, too, is the india rubber tree, with its thick, fleshy leaves, the tall stemmed mahogany and the camphor tree, with its sharply cnt and abundant show of foliage. Then we have the Japan maple, with its crimson shading, reminding us of New Englaad's autumn leaves, aud here by its side is the flamingo plant, with its broad, curled leaf of the brightest scarlet hue. The orange and the lemon also add their dense foliage of the richest green, with here and there rich samples of golden fruit.

Curious and Interesting Exhibits.

A single exhibitor from Cuba is said to show more than 1,000 plants and trees; another from the island of Jamaica comes with 250 speoimens. In one of the forcing houses there is a collection of palms owned in South Amboy, N. J., said to be worth $10,000. In an "annex" just ontside, an English florist makes an exhibition of rhododendrons, the finest and largest ever shown in America. Plants of rare and of curious growth, and others noted for their historical interest, are grouped and arranged so as to add in every possible way to the pleasure and attractiveness of this exhibit. Among the curious we have the famous California pitcher plant, with its cnp-shaped petals, blotched with yellow and green, as though designed as a fancy cup for mottled frogs to drink from There is, or a short time since was another peculiar plant—a small cluster of bnlbs growing from a piece of decaying bark. From ont of these bulbs springs a long, delicate drooping tendril, from the end of which a beautiful yellow flower has come forth. There are no leaves, nor even a vestige of green abont either tendril or flower. The bulb and its beautiful pendant flower must have secured its entire nourishment and growth and color from the dull decaying bark, from which, by some incomprehensible means, it has burst forth and matured without leaf or leaflet. This onrious plant is from London. Qoite prominent among the ferns, with their brown trunks and feathery leaves, is a weeping tree fern—a most magnificent variety of this interesting and, of late, popular family of plants. Its drooping leaves hang in graceful symmetry aronnd its hidden dark brown stalks.

An Historical Plant.

Among the plants of historic interest, there is one—a sago palm—which formerly belonged to the great Revolntionary financier, Robert Morris; him throngh whose timely aid the Contioental army was saved from disbandment or starvation, aad from whose purse the impoverished treasnry of the struggling colonists was repleaished, and the great Centennial we celebrate made a possibility. This plant is not beantifnl to look upon, but it has a history upon which, during this Centennial year, all delight to dwell. Its body is some eighteen inches thick, bnt only ten feet in hight, and its age is proclaimed, in all solemnity, to be from 125 to 130 years. It bears a silver shield npon which is inscribed: "Cycos Revoluta; owned by Robert Morris, before and during the Revolntion. Presented by Jacob Hoffner."

There is also a date palm, originally from Bermnda, from whose jnicy trunk, though only thirteen feet in hight, spring numerous branches. It first found its way to Mississippi, then became the property of William Ravea, of Charleston. When South Carolina seoeded Raven sold ont to a New Orleans gentleman and the tree found its way once more to the banks of the Mississippi. It was then fifty-four years old, and while it was in that city. the celebrate dlitigant, Mrs. Gaines, once saved her life from assassins by taking shelter behind its favoring trunk. Its freqoent transplaoting, migrations and vicissitudes, have earned for it quite a chapter in the history of the last half century of American horticnlture.

In addition to the productions of natnre, art has also contributed largely to the floral display in this building. The formers of artificial flowers have sent numerous contribntions in wax and large qnantities of natural flowers, preserved, chemically and otherwise. These preserved flowers consist chiefly of funeral wreaths, harps, crosses, etc.

The Great Floral Display of the Season

Was made abont the last of May, in the floral "annex" to the horticultnral building, by Anthony Waterer, of Surrey, England. This display consisted of some 135 varieties of rhododendrons, among which were nearly 1,000 different specimens in full bloom. This sight, alone, was well worth a visit to Philadelphia, and was such a floral exhibit as was never before seen in America and may never be seen here again. It was not only a thing of beauty bnt it was really a joy forever, for no one who saw it can ever forget those lovely combinations of charming tints, and the gorgeous richness of the thousands of masses of bloom which were there presented to the eye of the beholder. The building in which the exhibit was made was also happily conoeived. It consisted of a Gothio arch of frames, springing directly from the ground, and covered with canvas instead of glass, by which a mellow, softened light was produced, free from the glare and heat usnally met with in a conservatory. It was perfectly delightful to wander through the winding paths of this structure, the ground in which was thrown into graceful curves of unevenness, and the paths bordered upon either side with gronps and masses of the plants, all topped with branches of bloom, rich with every conceivable tint of color from the most delicate throngh every shade of pink to the deepest red of carnation. To stand upon the rsised bank at the fnrthermost extremity and look down upon that gorgeous mass of varied color hefore and below, was one of the richest sights which the lover of color and of flowers could desire to look upon.

Horticnltural hall and its snrronndings, including the deep and shady recesses of Laasdowne ravine, is a most delightful retreat in which to rost the head and eyes after wandering throngh the other great buildings, filled with machinery and all the vsried products of art and indnstry. There, amid windiag walks bordered with trailing vines and trees and flowers of every hue; amid shady recesses, running brooks and sparkling fonntains, the lover of natnre delights to turn away from the practical to the beautiful, and linger awhile where Flora reigns supreme. Here Patrons are reminded of all that is beautiful and good in our noble Order. From here Laborer and Husbandman, Matron and Maid may carry to their distant homes, in the broad prairies or on the mountain slopes, some new ideas that will bud and blossom and add new attractions to garden, field and lawn.

W. B. E.

Archæological.—A telegram from Philadelphia, dated the 4th inst., says: A large nnmber of gentlemen from western and northwestern States and Territories, with representatives of the Government Coast and Geological Surveys, and a few distingnished scientists from abroad, assembled to-day in the Ohio State building, on the Centennial gronnds, in response to a call of the Ohio association, for the purpose of forming an international archæological association. Gen. Brinkerhoff, of Ohio called the meeting to order. Prof. Cox, of Indiana, was chosen temporary chairman. Dr. Halderman, of Philadelphia, made an address of welcome, complimenting the Ohio association upon the interesting and valuable character of its collection at the Centennial exposition. An instructive discnssion followed npon recent discoveries. A permanent organization was effected, with the following officers: President, Col. C. C. Jones, of New York; Vice-Presidents, Prof. Cox, of Indiana, aad F. W. Putman; Secretary and Treasurer, S. D. Pelt, of Ohio.

The Cassiar Mines.—The steamship *California*, from Cassiar, has bronght $40,000 in gold from the mines. Only one or two big strikes are reported at Sitka. Gold diggings are reported on the Keuni river, whioh empties into Cook's inlet. Four men took ont $4,000 in a short time.

A water right for the purpose of supplying the Beach mines, on the Columbia river below Umatilla, has been taken by Wilson S. Gaston. These mines have long been worked by Chinamen with hut slight results, owing to the limited amount of water.

We shipped $5,337,394 in treasure last month to New York and foreign ports, against $1,434,268 in August, 1875. The receipts of coal at this port since Jannary 1st have been 369,000 tons, against 344,200 tons in the same period last year.

Mason won the International chess tonrnament prize at the Centennial.

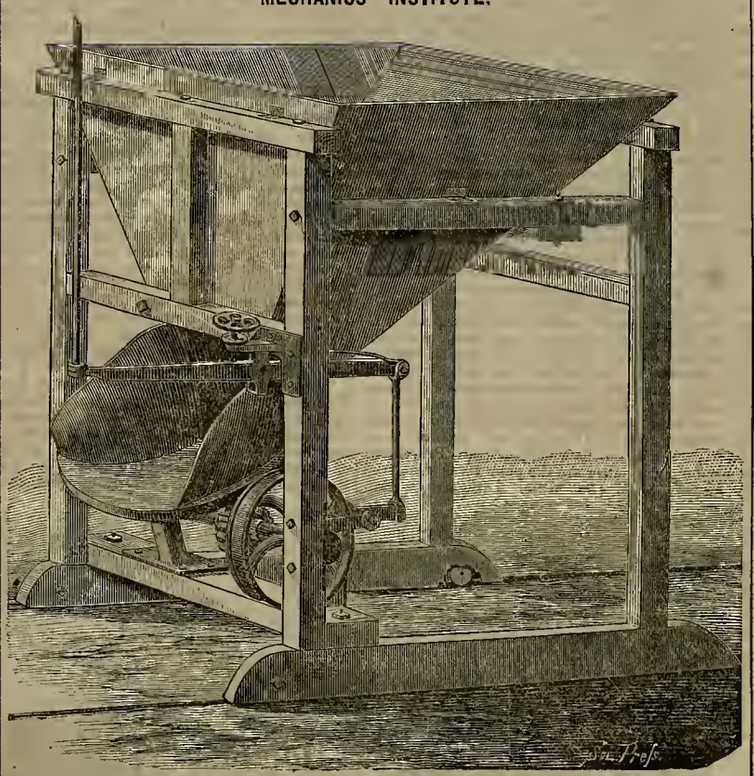
HENDY & COCHRANE'S ORE FEEDER

FOR QUARTZ MILLS,

AWARDED FIRST PREMIUM AT THE TENTH INDUSTRIAL FAIR OF THE MECHANICS' INSTITUTE.



It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply *dropped*. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says, of the Table Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them."——A letter from Mr. O. O. Belding, of Amador County, speaks in the highest terms of them.——Two of the machines were shipped to the Bunker Hill Mill, Amador County.——Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen.——Mr. Lachman, of the Soulsby Mill, Tuolumne County, says they work splendid; could not do better.——Two of the machines were shipped to the California Company, Nevada City.——O. J. Garland, of Mosquito Gulch, Calaveras County, says: "I find them an excellent machine."——S. D. B. Stewart, Supt. Lincoln Gold Mining Company, says they are a perfect success.——O. C. Hewitt, Supt. Keystone Mining Company, says: "I can safely recommend them to all millmen."

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other machine of its class.

CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

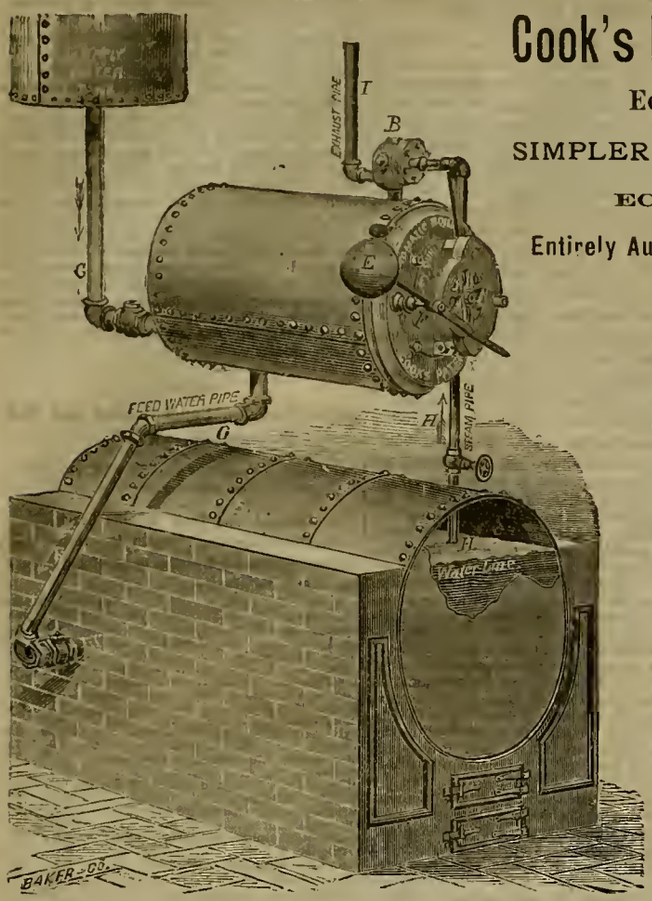
Cook's Patent Automatic Boiler Feeder & Regulator.

Economy in Operation. Absolute Safety from Explosion.

SIMPLER THAN A PUMP, AS IT REQUIRES NO ATTENTION.

ECONOMY IN FUEL.

Entirely Automatic, Reliable & Durable.



Cook's Automatic Boiler Feeders

WERE AWARDED THE HIGHEST PREMIUM OVER ALL MACHINES EXHIBITED AS BOILER FEEDERS AT THE CINCINNATI EXPOSITION AND THE ST. LOUIS FAIR.

The cuts show the operation of the Feedor. It was described in detail in the MINING AND SCIENTIFIC PRESS of May 20, 1876.

This Feeder will discharge from 40 to 200 gallons of water at one movement, where a pump would require hundreds of strokes to do the same work.

The water is kept exactly at the proper line, whether running fast or slow, without attention from the engineer.

Feeders, Heaters and Regulators Combined are made on this principle. Simple and economical.

The control of feeding water to the boiler, is taken out of the hands of the engineer and left to unerring natural laws.

These Machines are now introduced on this coast for the first time, although they are extensively used in the Eastern States. They supply the boilers with great regularity, and keep the water at exactly the same levsl. As a protection against explosion, they are simply perfect, leaving nothing to be desired.

ONE OF THESE FEEDERS CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS.

Address,
For Circulars and further information,

Idaho.

THE MINES.—Idabo *Avalanche*, Sept. 2: At the Poorman matters are moving along finely. The stopes are opening up splendldly and the rock exceeds the most sanguine expectatione of the superintendent. The ledge, where the main portion of the work is in progress, is quite large and abounds in high grade ore, all of which promieee a handsoms yield. Quite a large quantity of this is now ready for crnsbing, and the work of hauling it to the mill will commence in a few daye. Operations on the 7th level will, in a few days, reveal a still better quality of ore from that section of the mine, and altogether the Poorman has to-dav as fine prospects as its most sanguine friends could wish for. Captain Bledsoe is driving the work with his usual energy, and a good bullion product from the Poorman may be expected. At the Empire the work of hoisting water is still in progress. The upper levels are entirely clear now and workmen will proceed to etoping to-morrow or next day. There has been no caving or any damage sustained through the recent period of inactivity, so there is every promise now of most encouraging operations. The water will all be removed from the lower levele by Thursday next, and the rich ore known to exist there will be brought to the surface. There is nothing definite concerning the resumption of operations in the Golden Chariot, although letters have been received here during the paet few days from helow, announcing that the superintendent would be up here ahout the 12th of Septemher and pay off.

In the Mountains.

EnITOAS PRESS:—I am very comfortab'y domiciled here at what is known as the "Bridge house." It is sitnated in a deep valley, with high rocky monntains on every eide, and in the midet of the wildest ecenery. I eaw very little from the railroad when we came np, as it was after night before we arrived at any notable pointe, but I am satisfied that there is nothing on the line of the road to compare with what I have seen about here. The valleys are heavily timbered with yellow and sugar pine, sprnce, fir, red cedar and tamarack, and the sngar pine in the markets is mostly furnished by the mille in this vicinity. The lumber is hanled by four, eix and eight-horse teams, from eight to twenty miles to the railroad stations, and thence shipped to the city.

J. C. Culbertson owns the toll road here, having built it over some very rough country to connect the railroad station with his mills and interior conntry.

The monntaine are seamed nud split up with deep gorges and their tops are quite bare. All the rocke are much worn, as if washed with water, and they have deep grooves nnd scratches running in one general direction, which appear to have been formed by a glacial action similar to that which has marked the rocks on the coast of Labrador and Newfonndland and in the valleys of Switzerland. If such an action has caused this peculiar appearance, it mnst have taken place ages ngo, when the climate was very different from that which at present prevails.

The snmmere are short, beginning about June, and snow begins falling sometimes as early as October, but not usnally before Novemher. The climate is warm bnt not oppressively eo, and a pleasant breeze is always stirring. The grass and the foliage of the trees are green and beautiful as they are in the spring with us; and springs of clear cold water, that seems as if it came from snow, hurst from the sides of the mountains in every direction, crossing the road every few hundred yards. The road is liusd with mosses and ferns; wild blackherry, thimble berry and other bushes abound, making this the most beautiful resort one can imagine.

The winter snowe—the effects of which nan even now be seen—are something wonderful. The cold is never great, rarely falling to eight or 10 degs. above zero, Fah., and the average temperature is about 35 degs. The enow falls in immense volumes, etanding last winter 12 or 14 feet deep on a level. It is moist and holds together so that it will pile np in enormons massee and with such a weight as to ornsh in the steepest roofs, unless nonetantly cleared away. As an iustance of its force, the cap timbers which croes the tops of the finmes are from five to eight inches square, and their ends project only a foot heyond the edge, yet I have eeen these ends hroken short off hy the weight of the snow which accumulated upon them. I can now well appreciate the difficulty in keeping open a railroad which crossee these mountains and only wonder that it is as efficiently done as it is. S.

Culhertson's Station, Sonth Yuba, Sept. 4th.

BULLION SHIPMENTS.—Bullion shipments from the following mines have been made since onr last report: California, Aug. 30, $81,347; Ophir, Aug. 31, $23,155; Comanche, Aug. 29, $7,793; Northern Belle, Aug. 29, $8,171; California, Aug. 31, $170,022; Tybo Con. Aug. 27, $9,236 Total for month, $52,039. Ophir, Sept. 1, $56,713; Con. Imperial, Sept. 2, $12,348, and $22,135. Total for August, $77,809. Leopard, Sept. 1, $6,074; Calaveras, Aug. 29, 212 ounces bullion; Con. Virginia, Sept. 2, $25,381; Northern Belle, Aug. 31, $7,991; Jefferson, Aug. 30, $406.25; Arizona, Sept. 3, $2,922; Con. Virginia, Sept. 4, $47,319; California, Sept. 4, $219,037; Northern Belle, Sept. 3, $8,352; General Thomas, Sept. 3, $4,275.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PAESS American and Foreign Patent Agency, the following are worthy of mention:

CUT-OFF BLAET TUYERE IRON.—Isaac S. Van Winkle, San Francisco. This invention provides certain improvements in that class of tnyeres which are employed for hlast furnaces and forges, and it consists in so conetructing the tuyere that it will have a tendency to convey away from the grates all flux and other substances which will cloy them. The grates themselves are so flanged as to present an additional protection, and also to prevent leakage of air aroond them. The inventor combines with them a valve which is capable of heing adjusted so ae to regulate the blast or cut it off altogether. By means of this valve the full opening of one, two or three grates can be permitted, or by turning it one or all of them may be ehut off, and the size of the fire may thus be regulated for large or small work and greatly economize fnel.

MINEA'S CANDLESTICK.—Dennis Quinliven and Robert Lineberger, Ukiah, Mendocino Co. This invention is a novel device for holding candles which are to be nsed in tunnels, mines, or other places where it is deeirable to support a light in various positions to show the work, while the hands are free. It consists of a socket for holding the candle, and this eocket has three prongs or hooke so that it can be supported in any position where there is the least crevice, projection or irregularity. The socket may be stamped out of eheet metal, and has formed with it three projectione. Two of them are turned to a point and stand downward and backward from the socket. The other point extende npward and is hent into a backward curve eo it can be readily hooked on any irregularity or projection which may be convenient.

RECEIVING AND DRYING SHEETS FROM PRINTING PRESSES.—John D. Yost, San Francisco. This machine relates to a novel means for receiving and supporting printed sheets after they leave the press, so that they shall be hung in the least possible space without touching each other, to dry. In certain classes of printing, as of labels in colors, and when a heavy sizing or gloss is used upon the sheets, it is necessary that the sheets can be placed separate, so they can dry for several days without being touched. It has, therefore, been customary to remove each sheet from the receiving table as soon as placed there by the flies, and these sheets are usually attached in pairs, back to back and hung in lines stretched across the room. This improvement consists in receiving the sheets directly from the flies upon supporting rods, so that they hang vertically, and are just sufficiently separated to prevent their touching. They are, by the means adopted, received on the rods with a rapidity equal to that with which they could be thrown on a table by the flies. The rods are then removed to longitudinal frames.

LASTING CLAMP.—David Morey, Watsonville. The patent covers an elastic clamp for lasting the upper leather of shoes and boots, and it consists of a yoke having a screw passing through its center and a pair of forceps, a process so attached at each end of the yoke that they can be made to seize the edges of the leather of the upper, and when the screw is turned up against the bottom of the last it will cause the forcep to hold the leather more strongly as the strain increases.

SOLDERING FURNACE.—Ferdinand C. and Charlee C Smith, Portland, Oregon. The ob ject of this invention is to provide a soldering furnace which will be more durable than the ordinary sheet iron one heretofore used, and one which can be cheaply manufactured; in which those parts which are most likely to burn out or become destroyed can be readily removed and replaced with new ones. The peculiar conetruction ndmite of this furnace being made of cast iron.

QUICKSILVER RETORT.—Frederick Gutzkow, San Francisco. This invention consists of an improved retort for separating solid substances from their gaseous oontents, and specially for separating quicksilver from its ore by distillation. The retort stands vertically and admits of continuous working. It is formed of flanged plates of cast iron, clay, or other material, the object being to allow a speedy and cheap replacing of worn-out plates without disturbing the furnace itself.

AN AGRICULTURAL ANNEATISEMENT.—Probably the largest advertisement in the world is that of the Glasgow *News*, which displays its name on the slope of the Ardenlee, Scotland. The length of each letter is 40 feet; the total length of the line 323 feet, and the area covered is 14,815 feet. The borders of the letters are ehown with a pure white flower, the center is set with dwarf beet, the dark purple of which shows well at a distance, and on each side of this there is a row of light purple candytuft.

THE production of the Comstock mines for the month of August aggregated over $3,500,000.

THE Mechanics' fair will close on the 16th inst.

Asbestos and its Uses.

Ashestos is a mineral enbstance unaffected by fire. The name amianthus is now applied usually to the finer and more silky kinde. A single fiher of this substance fuses into white enamel glass; but in the maes it is capable of resisting ordinary flame, and is hence extensively used in the manufacture of fire-proof roofing, flooring, steam-packing, clothing, safes, paint felting, etc. The ancients wove a cloth out of it for the purpose of wrapping np the bodies of the dead when exposed on the funeral pile; they also made napkins of it which were cleansed hy throwing them into the fire, and used the finer varieties for the wicking of votive lamps. Gloves for handling hot iron have been made of it in Fraoce; but as a general thing clothing made of asbestos is now more of a curiosity than anything else.

The principal nsee to which the material is more practically adapted are enumerated above. Perhaps its most extensive use is for felting for steam boilers, pipes, etc., to which it has been found to be most admirably adapted. At the Mechanice' Fair, the Salamander Felting Co. exhibit various specimens of crude asbestos, such as is used for coating steam boilers, pipes, etc. They exhibit it aleo in practical nse on the varions steam pipes abont the bnildiug. This salamander felting, as it is called, is a nonconducting compositiou for ooating steam boilers, drums, pipes, etc., the object being to prevent the radiation of heat and condensation of steam. It is composed of asbestos and other fireproof and non-conducting material, and ie the best covering for thie pnrpose yet discovered, saving all the way from fifteen to thirty per cent. in fuel. It can bs applied while the boilere and pipes are hot, so that it does not interfere with their use. It is suscentible of a smooth and beautiful finish, and may be painted or ornamented in any tasteful manner.

One of the great problems of the age is how to ntilize the power developed by the combustion of fuel. It is well known that by far the largeet portion of such power goes to waste, and we have been unable as yet fully to control it. Felting made of the material under consideration has done much to save that power. It has been applied with satisfaction to hundreds of steamboat boilers, etationary boilers, and steam machinery of every deecription; to hot water pipee in hotels and private houses, to hot air and blast pipes, locomotives and steam threshers; and to various other purposes, euch as roofs, fire-proof window shuttere, ranges, stoves, ceilinge, safes, and in faot to all purposes where it has been desirable to prevent the radiation or transmission of heat. In addition to the advantages possessed by thie class of felting in non-conductiug peculiarities, it is very light, does not crack or crumble off, and preserves iron from rnst or corrosion. It is put np in barrels in a plastic state, nnd is applied like mortar. It is entirely indestructible by fire, and hy moistening in water can he used over and over again on the eame boilers and pipes, or on another eet.

Seward Cole, 317 California street, who is owner of the patent of salamander felting for this coast, is also agent for H. W. Johne' patent ashestoe materials. Prominent among them is asbestos steam packing, which is made in different forms. In nddition to the peculiar characterietics named, some varieties of ashestos also poesees superior lubricating qnalitiee, which render it, in the improved form, a perfect eteam packing, requiring little oil and without any tendency to heat or waste. The long and severe tests to which this packing has been subjected—in one instance having been nsed without removal on an ocean steamer which sailed over 90,000 miles, and in another, on a locomotive which run over 50,000 miles—establishes its economy. The rope packing is made hy a new process, by which the nsbestos fihers are securely covered by a thin hraid, in which form it can he safely transported and conveniently nsed. The loose packing coneists of finely separated, long fihers of asbestos, which can be twisted or packed into any desired form. The flat packing ie for gaekets, man-holes, plates, etc., is furnished in sheets of various thicknesses. Asbestos felt and concrete roofing are also made. The asbeetos painte are epecially adapted for ornamental structional painting. They are combined on different prinoiplee from any other paints heretofore produced, and contain no water, alkalies or ingrediente other than those beet adapted for the purpose. The firm also make steam pipe coverings, sheeting, lining, felt, oement, etc. Many of these articles may be eeen in the display of Seward Cole, at the fair.

Most of the exhibit, however, coneists of California asbeetos. The fibers have to be separated before the enbstance can be made up into felting. The miners of this coast have wanted so mnch for the product, that up to thie time moet of the substance has been imported from Maryland. The company own a mine in that State and furnish it here all prepared at a less nrice than minere are willing to furnish the crude material. This, of course, should not be. Mr. Cole prefers the California asheetoe, if proper quality can be delivered in qnantity. He is willing to pay from $30 to $35 per ton delivered in San Francisco. As he is the only person here who will buy it at all, of course minere must sell it to him. There ie no general demand for the article, for the simple reason that everything made from it ie patented, and one firm control the patents. Specimens of ashestoe of good quality are frequently sent to Mr. Cole, but the large lots do not come up to the samplee. The stony asbestos is valueless, as it is the fiber which is wanted. It ie used as a binding material for the cement, so the fiher is wanted, not the pulverized substance, although the fibers should be separated. That which comee from the Eaet is all put through a hark mill and is ready for nee. They prefer to purchase it here in a crude form and prepare it themselves, if it can be hought for less than that which is ehipped from the East, but are nnwilling, of course, to pay a higher price than for that which is all prepared. Minere who own leads of asbestoe—and there are many of them—can get the price stnted ahove for a desirable article, hut ten or fifteen tone at a time nre preferred in one shipment. It must, however, come np to eamples and not be half worthlese stone.

[Copyrighted.]

Mechanical Ore Concentration and Separation.—No. 5.

(Written for the PRESS by FRANCIS F. M. CAZIN, M. E., Santa Fe, New Mexico.)

Minerals and Their Specific Gravity.

The following table of minerals (ore and rock) subject to mineral dressing ie arranged according to specific gravity:

NAMES.	SPECIFIC GRAVITY	
Platinum, n.	17	18.9
Mercury, n.	13.6	
Gold, n.	12.7	14.9
Silver Amalgam, n.	10.5	14
Silver, n.	10.5	
Bismuth, n.	9	9.5
Copper, n.	8.6	
Hessite (62.2 silver)	8.13	8.45
Molybdenum	7.5	
Sylveniate (26.2 gold + 14.3 silver)	7.99	8.33
Galena	7.4	7.6
Mendiprite (chloride and oxide of lead)	7	7.1
Wolfram	7	7.6
Matlockite (chlorite and oxide of lead)	6.9	7.2
Foliated Tellurium	7	
Brittle Silver or Glaserz (68.5 silver)	6.9	7.2
Cinnabar	6.2	70.2
Lanarkite (sulphate and carb. of lead)	6.8	7
Carbonate of Lead	5.46	5.48
Calomel (chloride of mercury)	6.4	6 5
Copper Nickel	6.6	5.7
Wolfenite	6.3	5.9
Bismuthine (81.25 bismutb)	6.5	7.8
Cerusite (77.52 lead)	6.5	
Smaltite (28 2 cobalt)	6.4	7.3
Caledonite, (copper and lead)	6.4	
Cupro-plumbite (copper and lead)	5.4	
Leadhillite	6.26	6.43
Stephanite (68.5 silver, 15.3 antimony)	6.2	6.3
Polyhasite (64 to 72 silver)	6.2	
Anglesite (sulphate of lead)	6.25	6.3
Argentite (87 silver)	7	7.4
Needle ore (36 lead, 11 cop., 36.2 bismuth)	6.7	
Copper silver pyrites (53.1 silver, 31.2 cop.)	6.2	6.3
Pyromorphite (phosphate and chlor. lead.)	6.1	7
Crocoisite (chromate of lead)	6	6.6
Flustone	6	.5
Gersdorite (28.1 nickel)	6	6.3
Cerasine (chloride and carbonats of lead)	6	5.3
Eulytine (69.4 bismuth)	5 9	5
Bromide of Silver	5.75	
Bournonite (41.7 lead, 12.7 copper)	5.7	5.8
Chalcosite (79.8 copper)	5.7	
Valentinite (83.4 antimony)	5.6	
Chloride of Silver	5.58	5.5
Ruby Silver ore (light) (65.4 silver)	5.6	5.8
Ruby Silver ore (dark) (59. silver)	5.4	5.6
Bunnite (38 lead)	5.5	
Red Oxide Copper (88.8 copper)	5.3	5.8
Stibnite (74.6 antimony)	5.23	
Cotunnite (chloride of lead)	5.24	
Sauarmontite (83.4 antimony)	5.22	5.3
Saynite (40.65 nickel, 14.11 bismuth, 1.68 copper, 1.58 lead)	5.14	
Polychromic Copper ore (55.5 copper, 16.4 iron)	4.9	5.1
Fablerz (30 48 copper up to 31 silver)	4.3	5.1
Wolfsbergite (copper and antimony)	4.7	
Tetrahedrite (57 to 32.69 silver)	4.6	5.6
Antimouite	4.6	4.9
Magnetic Pyrites	4.6	4.8
Pyrites	4.5	4.9
Kermesite (75 antimony)	4.5	4.6
Dufrenoysite (45.20 copper, 1.94 silver)	4.5	
Bismuth, red	4.3	4.7
Stannite	4.4	
Stembergite (33.2 silver)	4.2	
Wittenichlte (copper and bismuth)	4.3	
Copper Pyrites	4.2	
Zinchlende (black jack)	4.2	
Baryta	4.2	
Brown Hematite	3.8	4.2
Carbonate of Iron	3.7	3.8
Azurite (69 oxide of copper)	3.7	3.8
Red Antimony	3.7	3 8
Pyrolusite	3.7	3 8
Atacamite (56 oxide of copper)	3.7	
Sphaerosiderite	3.6	
Malachite (57.3 copper)	3.5	4
Arsenite	3.7	
Red Oxide of Manganese	3.3	3.7
Calamine	2.6	4.4
FLUORSPAR	3.1	
HORNBLENDE	3.1	3.4
DOLOMITE	2 8	
PORPHYRY	2.7	2.8
SLATE (argillaceous)	2.7	
QUARTZ	2.7	
CALCAREOUS SPAR	2.6	2.8
GRANITE	2.5	3
LIME ROCK	2.5	2.8
FELDSPAR	2.5	2.6
SANDSTONE	2	2.6

EVERY PART STRENOTHENE A' PART.—This is the latest: Blood is becoming the faehionable beverage in Cincinnati, being thought a great remedial draft for invalids suffering with anæmia and generally "run down." The Cincinnati *Commercial* describee a place in John etreet where between two and four o'clock in the afternoon ladiee congregate and drink blood fresh from the slitteu throate of hullocks. They seem to enjoy it, but it is said to be not altogether conducive to good health. At the slaughter houses in this city the Eaet river consumptives may be seen almost any day drinking the life blood of eteers, bnt as yet the custom has not become as fashionable ae it is said to be in Cincinnati.—*Daily Graphic.*

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING AUGUST 29TH, 1876.

MEAL BINS.—Jacob R. Felter, San Bernardino, Cal.

DIAL TELEGRAPHS.—John O. Ludwig, S. F.

WINDMILLS.—James N. Rundle, Visalia, Cal., assignor to self and David L. Tonseca, S. F.

ORE CRUSHER AND FEEDER.—James Tullock, Oakland, Cal.

PLOWS.—Stephen M. Harris, Forest Grove, Ogn.

ELLIPSOGRAPHS.—Henry O. Root, S. F.

FIRE PLACE AND FURNACE.—Reason Wiley, Arcata, Cal.

DESIGN.

CENTER PIECE.—(two cases.) Samuel Kellett, S. F.

TRADEMARK.

CIGARS.—John W Schaeffer, S. F.

——"The patente are not ready for delivery by the Patent Office until some 14 daye after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Lap-Welded Water Pipe.

In the machinery department of the Pavilion, near the large engine, may be seen a display of water and gae pipe, tubes and pump columns of all sizes from eigbtb-inch to fifteen inches in diameter, exhibited by Dnnbam, Carrigan & Co. Althongb the pipe migbt only receive a paeeing notice from a casual visitor, it is, in view of its nsefnlneee, eepecially on tbis coast, wortby of ae close an examinatinn ae any of tbe more pretentious exhibits in the fair.

While most of the gas and water pipe manufaotnred and shipped to this coast is known among dealers ae butt-welded, the pipe exhibited by this firm is lap-welded pipe. Tbe advantage of thie etyle of pipe is its equal and increased strengtb throughout all parts. It is not fnll of ridges on the inside, as in tbe caee of tbe butt-welded pipe. The interior will be found as perfectly smooth ae the exterior, thereby insuring lees friction and greater discharge.

Tbe lap-welded pump colnmn is fast becoming celebrated among mining men as something long needed, especially in deep mining both in this State, Nevada, and Utah. Its advantagee over the old-fashioned riveted pnmp colnmn are so numerous that our limited epace wonld not admit of detailing them. Suffice it to eay that, being perfectly smootb on its inside, it will discbarge ahont one-third more water with the same or less power than a riveted column, which is acconnted for by the great obetrnction of the rivet heads and eeams in the latter etyle of column; moreover, the constant jarring will in course of time oanse rivets to wear and break, and ae a consequence, a large amonnt of water which shonld be raised to tbe snrface will be pouring out of the seams and falling back into the mine. The lap-welded colnmn being equally solid and strong throughont its entire circumference, entirely obviates this trouble, ae no water can come throngh its sides until the pipe itself is worn ont.

Although a comparatively new article, there are already thoueands of feet now in use on this coast, and all the late heavy and costly pnmping machinery on the Comstock lode has been fnrnished with the lap-welded column pipe. Upon inquiry we find that another great eature about thie colnmn is the fact that its cost is no greater than the riveted.

Messrs. Dunham, Carrigan & Co. also exbibit samples of welded water pipe, ranging from three to fifteen inches in diameter, especia ly adapted for public and private water works, and for hydraulic mining. This pipe is coated both inside and ontside with an indestrnctible patent enamel, which effectually protects the iron from all action of rust, as well ae deetrnction caused by the alkali and mineral which so impregnates the majority of the water in this State. Nnmerons chemists in the East have made exhanstive experiments with the patent enamel, and have given certificates to the effect that it is not affected by the action of alkalies, acide, hot or cold liqnors, or ealt of any description, which in general uee are apt to be conveyed through pipe coated with it. Price sometimes being quite an object in laying long lines of pipe, we find tbat lap-welded pipe is sold at prices fully as cheap as riveted or cast iron pipe, and is pronounced far superior to either.

Tbis firm aleo exhibit samples of lap-welded qnicksilver flasks, an entirely new article in American manufactnres, which in appearance and finish are far superior to the rough and cnmbersome English flasks heretofore the only ones in nee. Dnnham, Carrigan & Co. assnre us that their flaeks are tested under a pressnre of one thousand ponnde per square inch, and they gnarantee every flask to be perfect. As quicksilver forms one of our great mining products on this coast, these flaeks are well worthy the inspection of all who are interested in this branch of industry.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

THERE is not a medical man who denies the efficacy of sulphur as a radical remedy in the larger proportion of skin diseases which prevail in cities; and there is not a medical man who does not indorse GLENN'S SULPHUR SOAP as the best way of applying it. Sold everywhere.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44 00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Pce Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

DEETKEN'S

ROASTING FURNACE,

For Gold, Silver and Copper Ores.

The roasting capacity of the Furnace, per 24 hours, is from 6 to 50 tons, according to percentage and nature of the sulphureted ore, with an expenditure of one and a half to two cords of wood, and two to three shifts of unskilled labor, according to amount of ore handled. The Furnace is adapted for chloridizing, as well as oxidizing, roasting, and for the manufacture of sulphuric acid. In point of cheapness of construction and efficiency in working, the Furnace is far the best in use. Millmen in need of a cheap and efficient Roasting Apparatus will apply to

G. F. DEETKEN,

Consulting Metallurgist, Grass Valley, Cal,

Furnace can be seen on application for permit, at Grass Valley.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

Cotton Gins, Printers, Cheese Makers Laundries, Cabinet Makers, and All Manufacturing where Light Power is Required.

A. L. FISH & CO.,

Sole Agents for California,

9 and 11 First Street, - - San Francisco.

Buffalo Excelsior Pony Planer & Matcher

Best of its kind in use. Price, complete, $275. Also, small Pony Planers and Planing Machine Knives, which are recommended as superior and extra in quality. 100 Scroll work designs free on receipt of stamp. For circulars giving detailed information, address

Patented Mar. 30th, 1875. GEO. PARR, Buffalo, N. Y.

NOTICE TO PARTIES ORDERING FURNACES.

The mining public is hereby notified that all persons who represent themselves to be my agents or to have authority under my patents to build and use, or to contract with others for the right to build and use a Cylindrical Rotary Roasting Furnace (except in Lander county, Nevada,) are frauds, and any person or persons that constructs one of my furnaces either with or without additions, alterations, or supposed improvements, or attempts to use one constructed under a contract with any such unauthorized person, will be prosecuted as infringers of my rights on the premises. I have made arrangements to have all my furnaces constructed by the Etna foundry, in this city, and no other foundry has a right to make one without my written consent. For rights to build and use, address

GEO. W. WHITE, Patentee, care of Etna Foundry.

San Francisco, Aug. 22d, 1876.

Practical

BOOKS

—AT—

BANCROFT'S.

A. L. Bancroft & Co. keep on hand a large stock of American and European Books, Suitable for

CIVIL ENGINEERS,

FARMERS,

MACHINISTS,

And Industrial Classes generally, and supply them, post free, at published prices; for particulars of which see catalogues, which will be forwarded on application.

A. L. BANCROFT & CO.,

721 Market Street, S. F.

SANBORN & BYRNES,

STAIR

BUILDERS,

Mechanics' Mills, Mission Street,

Bet. First and Fremont, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins, Fancy Newels and Balusters.

San Francisco Pioneer Screen Works,

J. W QUICK, MANUFACTURER,

32 Fremont Street, San Francisco.

Several first premiums received for quartz mill Screens, and perforated sheet metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

MINING MACHINERY DEPOT,

PARKE & LACY, 417 Market Street, S. F.

SOLE AGENTS FOR

Burleigh Air Compressors,

ROCK DRILLS and

Tunneling Machinery.

HASKINS'

ENGINES AND BOILERS,

(SEMI-PORTABLE)

1, 2, 4, 6, 8, 10 and 12 H. P.

For Mines.

Large Assortment of

MORSE TWIST DRILLS.

HASKINS' PORTABLE HOISTING ENGINES, constructed especially for economical use in mining districts, with Compressed Air or Steam, adapted to all classes of underground work and made throughout on the interchangeable plan, so that all parts can be duplicated when desired. Catalogues and Estimates given on application.

GOLD MEDAL

AWARDED TO

San Francisco Steam Pumps.

We are prepared to furnish PUMPS UNDER CONTRACT, guaranteeing their ability to perform any specific work for which steam pumps are adaptable, such as

RAISING WATER FROM MINES

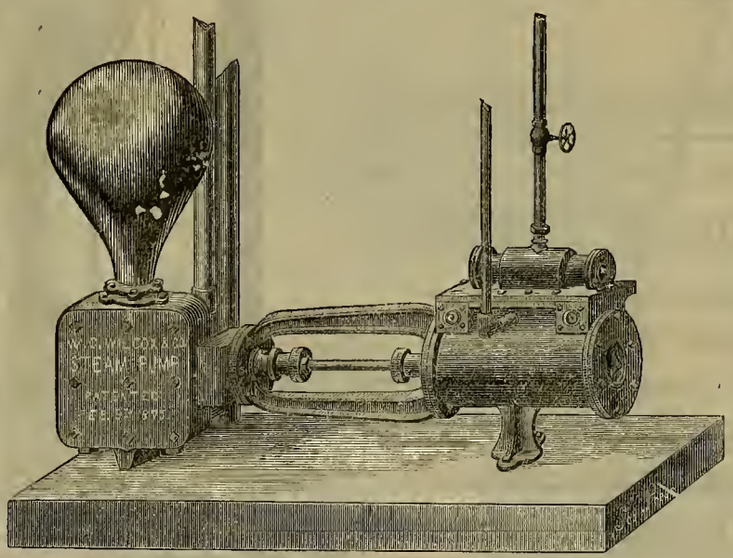
FOR WATER WORKS,

FEEDING BOILERS, RAISING WATER FROM WELLS; STEAMER AND SHIP PUMPS, ETC.

We would also call the attention of those interested, to our Direct Acting Deep-Well Pumps for raising water from

Any Desired Depth.

Also to our Especial Construction of Pumps FOR HANDLING QUICKSILVER or heavy liquids.



AFTER ONE OF THE

MOST THOROUGH TRIALS

Ever Had in the United States,

BETWEEN COMPETITORS

—OF—

Best Established Reputation,

In which, at great expense, the different Steam Pumps were tried under every test known to experts, the Examining Committee of the Tenth Industrial Fair of the Mechanics' Institute have awarded to us their

GOLD MEDAL

—FOR—

Best Steam Pumps on Exhibition.

We claim that our Pumps are the **best** ever made in **simplicity** of construction, economical use of power, **durability** and perfect adaptability for general uses, and we ask all persons interested to investigate **our title to this claim.** Salesroom at our Machine Shop, 114 and 116 BEALE STREET, SAN FRANCISCO.

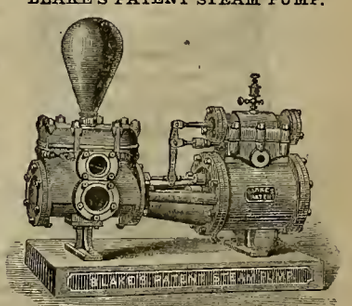
Planer Knives,

Nathan & Dreyfus' Glass Oilers, and Mill and Mining Supplies of all Kinds.

BLAKE'S PATENT STEAM PUMP.

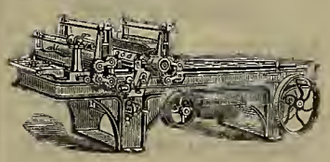


Over 8,500 in Successful Use in the Unite States.

California Planers and Matchers, and Wood Working Machinery of all Kinds

California Planer and Matcher

Is gotten up from new patterns specially for this Coast. It has Cast Steel Slotted Cylinder Head, running in patent self-oiling boxes; will plane 24 inch wide and *six inch thick*, and tongue and groove 14 inch wide. Will make rustic and stick gutters, or heavy mouldings, etc., and is the best job machine ever built. ☞ We have always on hand these machines with or without under cutter head, also, a large assortment of Planing Mill Machinery.

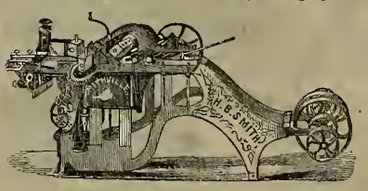


SMITH'S PATENT POWER MORTISERS. WITH LATE IMPORTANT IMPROVEMENTS.

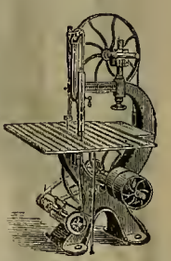
Mortiser.

Smith's Celebrated Molders.

We have four sizes of these Machines always on hand—"B," "C," "D" and "E,"—to work either three or four sides. Have slotted heads and all other improvements, and may be seen in any mill on the Coast. ☞ *Prices reduced* to 15 per cent. less than Eastern list. We have also, a large stock of all kinds of Planing Mill Machinery, such as Molders, Mortisers, Tenoners, Band and Jig Saws, etc. Send for our new Illustrated Catalogue. BERRY & PLACE, Selling Agents



Smith's Celebrated Moulders.



Patent
Band and Jig Saw.

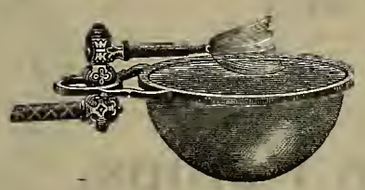
GAS SUNLIGHT APPARATUS.

Can be affixed to any Gas Fixture.



By the most Inexperienced.

Patented Nov 28th 1871 Re-issued Oct 15, 1872

Your attention is particularly directed to this new and valuable invention. It is especially adapted to the use of Compositors, Bookkeepers, Engravers, Jewelers, Tailors, Lithographers, for reading, writing and sewing purposes, and for all who have work to do and desire a soft, cool and pleasant light that will not injure the eyes.

For use in parlors it is unequalled, a single apparatus possessing more illuminating power than THREE ordinary burners.

For the sick room it is invaluable. The concentrating cup can be filled with water of any color, thus giving the patient a soft light of any desired shade.

For the dining room library—as a summer reading and illuminating agent—it is without doubt the coolest yet invented, giving an immense increase of light with a wonderful decrease of heat, a desideratum hitherto absolutely unattainable. All who have employed the most popular reading lamps of the present day, and have experienced the annoyance of the great heat arising from their use, will at once see the importance, comfort and utility of this beautiful invention.

Our regular burner is a "four foot," which consumes four feet of gas an hour, and will give a stronger light than the "Argand Burner," which consumes from ten to twelve feet per hour.

This apparatus consists of a hemispherical cup, made of flint glass, and supported by means of a light frame, constructed in such a manner that it is easily attached to any gas-fixture, the screw threads being the same as in all common burners.

We place our Burner in a horizontal position, instead of perpendicular as in the ordinary way, and fill the cup with water.

The light shining through the water is thus intensely magnified, and produces a soft, cool and pleasant light, exceedingly agreeable to the eye. By this means the obnoxious yellow-colored rays, which are so detrimental to the sight, are entirely absorbed and done away with.

The strong, yet mellow, illuminating power thus obtained is of the most practicable utility and value. It does away with the necessity of a drop-light, so objectionable by the constant escape of gas through the flexible tube, and at one-fifth its cost.

It is, in general opinion, the most efficient light, in every respect, that has been known, or hitherto introduced to the public. The facility with which this apparatus can be affixed to any existing gas fixture by the most inexperienced is another great point in favor of its general adoption.

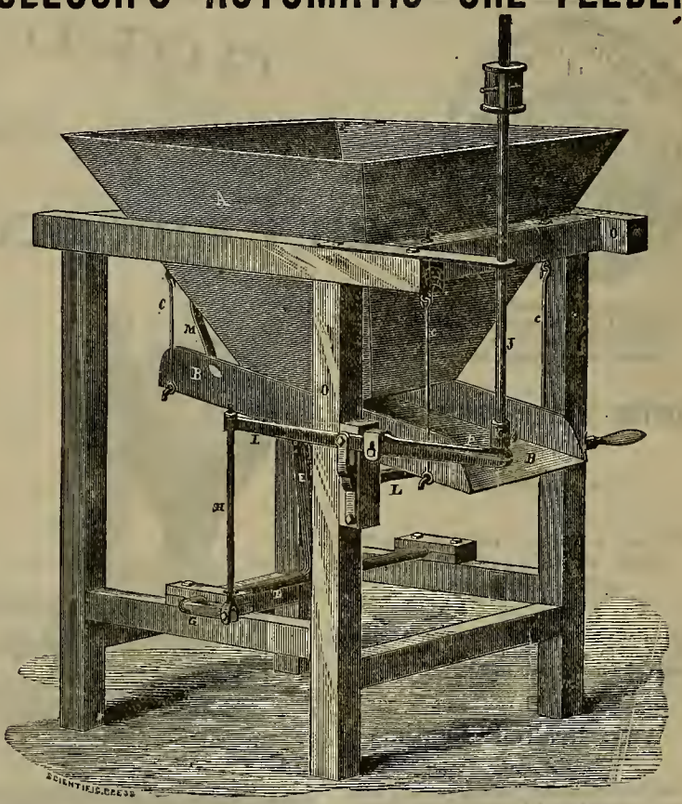
We invite all to call at our stand and examine the

GAS SUNLIGHT APPARATUS.

GEO. T. BROMLEY,

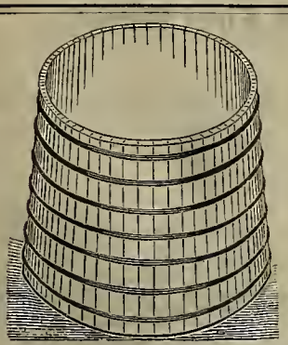
Sole Agent for the Pacific Coast.

TULLOCH'S AUTOMATIC ORE FEEDER.



It is the only reliable Feeder in use; is Simple and Durable; will feed all kinds of ore, wet or dry. Refer to the following Mills: Consolidated Virginia, California, Trench, Douglas, Leopard, Humboldt, Northern Belle, Phœnix, Sumner, Crescent, Gold Mountain, Hite, Columbus, Green Mountain, Duncan, Leonard, Eagle, Riverside, Shawmut, and others.

F. OGDEN, Sole Agent, 417 Market St.



WATER TANKS of any capacity made entirely by machinery. Materials the best in use; construction not excelled. Pan Staves, Tubs and Oak Guides for mining purposes a specialty.

VOLUME XXXIII. Number 12.

What Makes the Best Belt?

The question as to what is the best material for belting has long been a mooted one, and one upon which there is yet a difference of opinion. Some prefer leather, because they have used no other, perhaps; some prefer rubber belts, perhaps for the reason that they have found them much better than leather. Many prefer the rawhide belts of H. Royer, because they are more pliable and wear longer than any other. That belts are continually being changed from leather and rubber to rawhide is well known to us; that a change from rawhide belting has been made to any other we have never heard; therefore, we have fair reasons to believe the rawhide belting the best.

It may seem strange to many that we should speak of rawhide as more pliable than leather or rubber. As there can be no doubt that rawhide is stronger than tanned leather or rubber, we will speak more particularly of its pliability first. We visited the belting factory of H. Royer, 855 Bryant street, to investigate this subject, and though we found a notice on the door, "no admittance except on business," we pushed on. Courteously admitting the right of the press to investigate, Mr. Royer trued us loose, and we interviewed the premises. First, let us say, however, that Mr. Royer commenced the "fulling" of rawhides and their manufacture into belts some eight years ago, and has gradually built up such a business, that some four months ago he moved into his present commodious quarters, corner of Bryant street and Parke avenue, where he has erected a building 50x75 feet, four stories high, and sunk a good artesian well, that supplies 5,000 gallons of water per day. A 20-horse power engine furnishes the power necessary for all the manipulations of the hides, and pumps water into large tanks for ordinary purposes, and for use in case of fire. The lower floor is used for cleaning and hairing the hides, which are then taken to the third floor, looking more like large sheets of glue than anything else After being thoroughly greased with tallow, they are put through the fulling machines, then stretched, fulled again, and again stretched, and some fulled the third time, which renders them soft and pliable, and leaves the outside clean and dry, the tallow having been worked entirely into the hide. They are then passed to the second floor, where they are again stretched and cut into strips for belting, cemented together and riveted, ready for use. The upper floor is used for drying purposes only.

Lacing hides are carried through the same process of fulling and stretching, and all the hides are made perfectly soft and pliable without the use of any chemicals or tanning process, save the mechanical action of the machinery upon the hide. After seeing several of them go through their terrible twisting and turning, forward and backward, doubling and straightening, stretching and rubbing, we do not wonder at their pliability.

There can be no doubt that the process of tanning leather detracts from its strength and durability, but extracts the glue so that it will keep softer than it would with it in, where it is to be exposed to the weather. Now, belts are nearly always kept under cover, and consequently ordinary tanning is superfluous, and really injurious to the belt. Once made soft, the fulled belt will not again get hard, and besides possessing all its original strength, resists abrasion much better than tanned leather. In fact, rawhide governor belts will last nearly 20 times as long as a tanned leather one will. Also fulled rawhide properly prepared and afterward taken care of, makes the most durable harness. Another item in favor of fulled rawhide belting is that it is stronger in proportion to its weight, and flanks and poor hides cannot be so readily worked into them as they can be into tanned leather belts, as the fulling does not increase the weight, and but very little the bulk of the hides. It can never be turned back into common rawhide, nor will it get so hard as common leather.

Mr. Royer's move into his present location was a happy one for him, as he thereby avoided the late great fire, and also finds himself in position to fill some large foreign orders lately received.

An Improved Provision Safe.

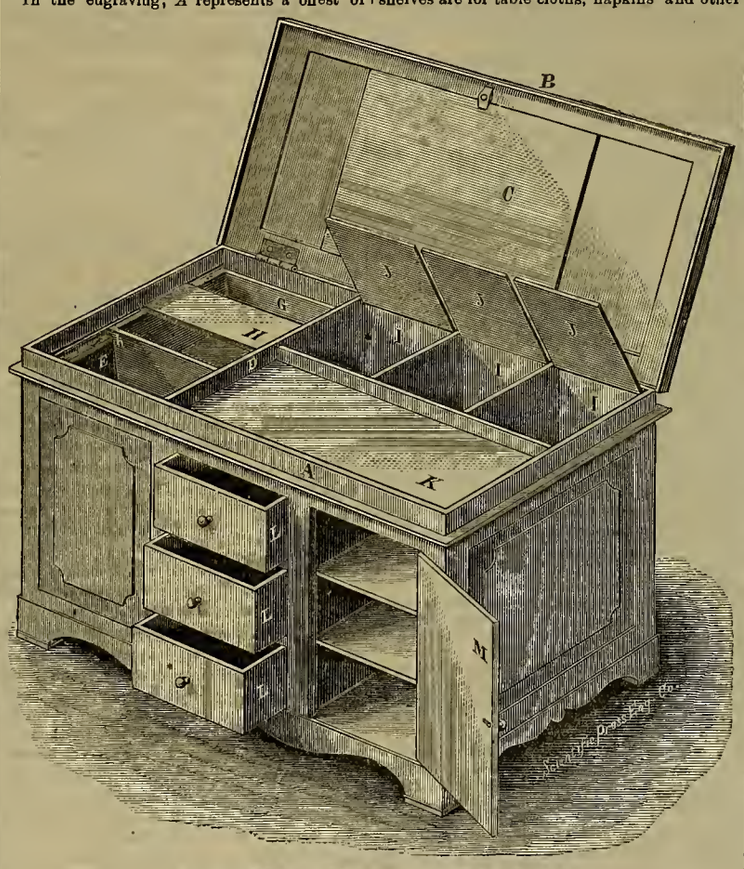
George McIntyre, of 753 Folsom street, in this city, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved kitchen accommodation safe, a representation of which is given on this page. I is a chest or cabinet, which is not only useful for holding articles used in cookery, but is also provided with drawers and shelves for containing napkins, towels, cutlery, and other articles which are used in and about a kitchen and dining room.

In the engraving, *A* represents a chest or cabinet having a hinged cover, *B*. The cover is constructed of a single panel, and this panel is depressed on the inside of the lid so as to provide a recess in which the head-board, *C*, will lie when not in use. A button on each side of the recess fastens the board in place. An upright partition, *D*, separates off one end of the box, so as to form the flour bin *E*. A rail or ledge, *f*, is secured to the end of the chest, inside of this bin, while a similar rail or ledge is secured opposite it to the upper edge of the partition. The dough tray, *G*, is provided with a shoulder or ledge, *n*, along the upper outside edge of its opposite sides, so that when the tray is set into the bin its ledges, *h*, will rest upon the rails or ledges, *f*. The dough box is shallow, so that it only projects downward a short distance into the bin, so that it can be slid back or forth on the rails or ledges, *f*.

When the dough box is pushed back against the rear side of the chest, sufficient space is left in front of it to admit the hand or arm of a person into the flour bin below, and this space, when it is not required to be open, is closed with a board, *H*, which prevents dust from entering the bin.

Along the rear side of the chest, between the flour bin and the opposite side, are two or more small bins, *I, I, I*, each of which is provided with an independent lid or cover, *J*, and which are intended to hold salt, soda, or other things used in cooking. These bins need not extend down to the bottom of the chest. Between them and the front of the chest, and somewhat below the upper edge of the bins is a bottom, *K*, which forms a shallow table for the cook to work upon.

L, L, L, are a series of drawers, which are placed one above the other in the middle of the chest, and are useful for containing knives and forks and other small table furniture. *M* is a cupboard door that opens to a series of shelves. The corner shelves and drawers extend entirely back to the rear end. These shelves are for table cloths, napkins and other kitchen and dining room cloths. This convenient and ornamental kitchen cabinet is on exhibition at the fair.



McINTYRE'S IMPROVED KITCHEN SAFE.

NEVADA STATE FAIR.—The Nevada State fair is in progress this week at Reno. The beginning was under good auspices. A dispatch on Tuesday was as follows: The opening day of the third annual fair of the Nevada State agricultural, mining and mechanical society augurs well for its being the most successful exhibition which has ever been held here. The attendance is larger than it has ever been before on the first day, and the entries in all the departments are more numerous. The pavilion is already well filled, and a large force of entry clerks are kept busy in recording the new arrivals. The art department would be creditable to much older places, and the articles of Nevada workmanship are meritorious. Light wagons and carriages make a fine display, and the agricultural and mining machinery are greatly admired. The weather is beautiful, the clear mountain air as exhilarating as a draft of the vintage of Champagne.

THE small-pox epidemic is rapidly decreasing in San Francisco.

California Powder.

The 15th of September ushers in the hunting season, when it shall be lawful for all good citizens to burn as much powder and fire away as much shot as they please in their search for game. Few of them ever think, perhaps, that in doing so they assist two prominent home industries—the powder works and shot factory. When this is hinted to them probably a few facts about the home powder works will be of interest.

Few people have any idea of the magnitude of the operations carried on by the California powder company, or could even guess at half the amount manufactured. The company own an extensive property on the San Lorenzo river, in Santa Cruz county, the head office and salesroom being in the city. The capacity of the mills is 640 kegs of mining powder per day, each keg holding 25 pounds. The capacity for manufacturing sporting powder is 20,000 kegs of 25 pounds each per year. They employ constantly 200 men, and make all the packages, both iron and wooden, at their own mill. Both steam and water power is used. There are 15 buildings at the works, besides the small village of cottages occupied by the employees, which is a short distance from the factory. There is an extensive cooper shop connected with the works, where 640 wood and iron kegs are made daily.

They make at these works all classes of blasting and sporting powder. The sizes of grain of the sporting, rifle, musket and cannon powder are designated by figures, not by letters.

The old method of using letters is not considered satisfactory, because there is no standard of F recognized by the different powder companies. The numbers 1, 2, etc., on the powder manufactured by the California powder company, and the letters FFF, FFFg, etc., on that of some other manufacturers, indicate the size of the grain, but have no reference to quality. This company begins with No. 1 for fine grain powder, and increases in coarseness as the numbers increase, No. 2 being coarser than No. 1. The finer grains, Nos. 1 and 2, are mostly used in dry weather, and for quick birds; while Nos. 3 and 4 are oftener used for larger game and longer range, it being a well known fact that medium coarse powder shoots stronger than fine, while it is easier on the shoulder.

The company manufacture several brands of Santa Cruz sporting powder as follows: The "Cabinet" is a special brand of powder introduced for fastidious hunters. It has a diamond grain, and is the best brand manufactured by the company. The "Eureka" is an extra quality of powder, with a crystal grain, and of double extra strength. The "California Sporting" is more especially for duck shooting, different manufacturers having a custom of making a brand for this purpose. The "Pacific Rifle" is a fine grained powder, claimed to be a very superior article. "Quail Shooting" is a brand for sportsmen generally, and is designed more particularly for use in shot-guns for general shooting. "Sea and River Shooting" is a powder of extra quality, made in view of our long wet winters, and for use about the bays and marshes. "Valley Mills" is a common gunpowder suited for all kinds of uses, hunting, sporting and musket shooting. "Pistol powder" is manufactured expressly for use in pistols, and is of special fine grain and extra quality. Of course there are different numbers from one to four of each of these brands.

The California powder company also manufacture large quantities of different brands of blasting powder: Of these, C signifies coarse; FC, fine coarse; FM, fine medium; F, fine; FF, double fine; and FFF, triple fine. They also manufacture Hercules powder for hard rock, pipe clay and cement, XX Hercules (or double strength) for heavy rock, boulders, etc. This is a nitro-glycerine compound, and the company claim for it safety and economy over other blasting powder. As an indication of its reputation, we are told that for each year since the company commenced manufacturing Hercules powder, the sales have more than doubled; and that this year they have averaged over 10,000 pounds per month more than the monthly sales of last year.

CORRESPONDENCE.

Mines of Humboldt and Lander Counties, Nevada.

[From Our Own Correspondent.]

Some of the Mines of Reese River District.

Leaving Bsttle Mountsin, distant from Ssn Francisco by rail 524 miles, a ride south for 90 more by stage (the Tnller & Clugage line,) hrings yon to the city of Anstin. It contains at present about 2,500 inhabitants, who seem to be less affected than usual hy the prevailing dullness. Isolated somewhat in position, they appear to give little attention comparatively to the rise and fall of Consolidated Virginia, having a perfect nest of little bonanzas of their own to keep the majority busy. The veins are generally small, from two and a half feet to four inches in width, bnt their name is legion.

As "good things are put up in little bundles," yon will not be surprised to hear of the exceeding richness of some of their ores, or of the enormons yield from some of their chimneys. The ledges of the district are generally in granite running parallel, northwest and southeast from 100 to 300 feet apart, and looked upon as true fissnre veins, the amount of treasure to he derived from this sonrce being limited only by the ability of man to unlock the numerous store-houses in which it has so long slumbered. The chloride ore is found near the surface. As the sinking proceeds nearly every form of silver ores are encountered, including bromide, iodide, stephanite, black sulphuret, ruby, horn and antimonial, to fine wire and native silver. If ore will not work up to $100 per ton it is thrown aside. The entire district averages as to all the ores worked, $230 per ton, some choice lots running up into the thoussnds, and the shipments of bullion in the past 10 years upward of $13,000,000. During the mining excitement that prevailed from 1863 to 1865, 15 or 16 mills were built at Austin and in the vicinity, most of which soon ceased to run, as the minee were not sufficiently developed to supply them with ore.

The Manhattan Mill and Mining Company

From comparatively small heginnings has grown into a large trunk, whose branches now overshadow more than half the city. It is the great enterprise of the district. Commencing on locations made by Mr. Frost and others, known as the North Star, Oregon, Southern Light and Blue ledges, a nuclens wss formed around which has been gathered the present valuable and extensive property of the company. The Independence and the Panamint, the former together with other ledges heing worked through the Frost shaft, and the latter through the Bowman incline, are said to be the most productive in the district. As they are situated further east than any previously found in that direction, the property of the company has been grestly enhanced in vslue.

The Independencc

Was cut at the 370-foot level of the Frost shaft only a few months ago snd shows one of the largest and best defiued veins in the district, with good large deposits of ore, giving pulp assays from $400 to $500 per ton. The Curtis shaft—a new one—now heing sunk for working the Panamiut, Allsopp and other ledges, has now nesrly reached the Panamint, which is yielding also large quantities of high grade ore. In addition to those mentioned, there are the Oregon and North Stsr shsfts, through which a nnmher of ledges are worked, principally on the tribute system, which adds materially to the income of the company. Furthermore, the Isahella, Mohswk, Ogden, Dollarhide, Eclipse, Grove and Hatfield are all, or most of them, in active operation under lease, provided with everything necessary for effective work, such as blacksmith shops snd good hoisting works, the company having no less than 13 on their different locations, about 80 in all, which are secured by U. S. patents and cover 160 acres of ground. The nnmher of ledges now worked hy the company is about 25, the oref om which, together with that of the greater part of the district, is reduced at their 20-stamp mill, whioh has recently heen refitted and placed in the hest possible condition, with Stetefeldt furnace, Krom concentrator, Brady rock-breaker and all necessary appurtenances for performing good work. It has turned out over $9,000,000 within the last nine years, and the monthly product is on the increase, that of Jnly heing $229,813.40.

That the readers of the PRESS may form a better idea of the richness of the ores, the following extract has heen tsken, hy permission of Hon. M. J. Farrell, of Austin, from the manuscript of an article prepsred by him for the *Mining Review*:

"In lots of ore worked at the Msnhattan mill (the only one now running) from $300 to $700 per ton is common, $1,500 to $2,000 frequent, $3,000 to $4,000 occasional, while lots have heen worked as high as $5,000 per ton, pulp assay."

Dividends may be expected for some time to come, as a conaiderahle reserve fund is understood to he on hand, and the outlook for the company is believed to have never been more promising. Before tsking up the other mines of the district, an allusion to the kindness and courtesy on the part of Mr. Curtis, the efficient superintendent, and Mr. Farrell, who has charge of the books, will, no doubt, be pardoned, as it is to them I am obiefly indebted for the facts here given, as well as for much other valusble information in regard to the operations of the company, necessarily omitted.

The New Pacific Company, (Limited,)

A London incorporstion, are working the Buel North Star incline, driving the 300-foot east and working two shifts. In the Pscific proper they are driving west from the 120-foot level on the Warren ledge and at the 240-foot level, cross-cutting south. They are also cleaning out the 400-foot level north, with the view of sinking for the North Star ledge. These are numbered among the best mines of the district, and when the present operations sre completed, as rich returns may be as confidently anticipated as in the past.

The Idaho,

The property of C. Dollarhide, promises well, the ore taken out of an incline 340 feet deep having paid something more than the expenses for opening, and improving as greater depth is reached, first-class ore working from $735 to $1,252, and seoond-class from $180 to $430 per too.

The Ruby,

A. H. Dollarhide, owner, formerly paid well on chloride ores near the surface. After reaching the sulphurets on the water line one lot of first-class weot over $1,200; second-class $350. Pressnt depth 330 feet, with drift running to strike ore chimney.

The Eclipse,

Or Reed & Curtis mine, is yielding some $400 ore on the 400-foot level. First-class from the 300-foot level believed to go over $1,000 to the ton. The mine is probahly paying considerahly more than the expenses of developing.

The Bedford,

Gates & Roden, owners. Incline, 300 feet. Present indications very encoursging. Some of the ore has worked $300 per ton, and assays have run very high.

The Jackson,

McGlennon, Trask & Holmes, owners. Incline 450 feet. Drift esst and west, 100 feet. Ore taken out was said to hsve run all the way from $200 to $2,000 to the ton. Some seen on the dump recently mined was thought to be worth from $2,000 to $3,000. Ledge from two feet to six inches. One heave of five feet had been met with, in other respects regolar from the top to the 450-foot level, where it split, one half running horizontally for 100 feet and then taking the usual angle of the lodge.

The Detroit,

Generally known as the Ward, from its princi pal owner. Incline 350 feet, with 50 more to ron hefore drifting. Hsd turned out rock that worked as high as $1,700. Some ore just sent to mill was estimated at $1,000. By the wsy, it is astonishing how close an estimate is often made by a practiced eye, when accustomed to a particular kind of ore. Both a winze and a chute had been started to prospect some old ground with the hope of striking it rich, with the chances greatly in its favor.

Detroit No. 2,

Lammerhsrt & McLaughlin, had reached a depth of 400 feet and still sinking. The location is among the furthest east, and in consequence considered so far favorahle. A good sized vein had heen found, hut no one in quantity had been discovered. Some nice strata of quartz streaked with rnby silver had begun to make their appearance, giving a gleam of encouragement for the further proseoution of the work.

"There is a tide in the affairs of men,
That, taken at its flood, leads on to fortune."

Many a miner has toiled and delved for years without success; perhaps in utter despair has ahandoned his claim to another to reap the harvest. It has heen so here. It ought not to he, for the indications are as readily understood, as easily followed and as sure of leading to good results as in any district in the land. The practical miner often scouts at science and boasts a skill acquired by experience, ignorant that he himself is, so fsr, scientific. Away with this quarrel hetween practice and science. Let them walk hand in hand as twin sisters, smiling at each other's faces, a mutual aid to progress, as they are and ought always to be. But I stray.

The Bowen and Lindsey,

If reports are true, has paid exceedingly well in the past, having yielded altogether about $100,000. Present depth, 150 feet where worked. First class ore valued at $1,000 and upwards; second class, $350 and $400 per ton.

The Dakota,

Frank G. Eogstrom's claim, is lo cated on large croppings, the vein matter betweeu walls, in places eight feet wide, of couree not all pay ore, but mixed with granite, and sometimes narrowing down to six inches in width. Incline, 480 feet. The mine is said to have turned ont a large amount of silver, some often psying as high as $2,300 per ton.

The Star of Nevada,

An old location, from which some $50,000 have been taken out, it is thought will he organized anew, incorporated and worked mostly hy citizens of Austin, not for speculative purposes, hut for what may be realized from the mine.

The ledges mentioned are within the city limits, and mostly on the west side of Lander hill. Immedistely over the ridge is situated the

King Alfred,

A London incorporation, on which a shaft 820 feet has heen sunk, cutting the extensions of some of the principal ledges of Lander hill, about 15 in all (msny of them, as has been ststed, very rioh, one at least that had some $5,000 ore) and vsrying in width from 20 inches to eight feet. The tests of the ore so far as made have proved satisfactory, and a beginning hss been made hy starting from the 500-foot level, contracts also heing let to run drifts east and west along the ledge. It is contemplated continuing the developments until all the ledges are tapped from different points in the shaft. We were much interested in the workings of some portions of the machinery at this mine, not in ordinary use, that seemed worthy of mention, for which due credit should be given to Capt. McGlennon, the superintendent. The engine is a 30-horse power, (link-motion,) the reels having cog gearing and worked hy clntches. The advantage claimed in this case is, that any weight can be lowered by steam, or if necessary the same end can be accomplished by the use of the hrake strap, by simply throwing out the clutch. In sddition to this, the reversing of the engine and management of the clutch are so arranged as to he under the fnll control of the engineer, nearly 50 feet distant, thus dispensing with the services of an assistant. Two boilers were found neoessary for running the engine and other machinery in conneotion with two steam pumps, one of which is at the bottom of shaft and the other at the 400-foot level, to raise the water.

Owing to the length of this commuoication a further notice of the mines of this distriot will appear in my next. A. C. K.

Alpine County—Its Mines and Resources, Past, Present and Future.

[Written for the PRESS by VICTOR HARLAND.—No. 7.]

Silver Mountain District.

Situated at the base of the high range of mountains that enclose it npon three sides, in a vslley or basin of nearly one mile in length and a quarter of a mile in width lies the town of Silver Monntain. Upon the north are the various mines previously mentioned, while on the south towers thst grim old sentinel, Silver Mountain pesk, with rocky sides, relieved by the emerald tints of verdant grasses and forest timber, resching from its hase till near the summit. The altitude of this monntain is given at 11,500 feet, and from its lofty summit can be seen far to the westward the far-reaching valleys of the Sacramento snd San Joaquin, with the Saorsmento river winding its tortuous way like a silver thread, 100 miles away.

Upon all sides the view from this point is magnificent, and a person standing upon its snmmit at this giddy hight is lost in wondering contemplation of the majesty and grandeur of the surroundings.

The ascent is easily accomplished in abont two hours from the town, and the elevation once gained, the labor in ascending is soon forgotten as the beholder pauses in wonder to view the scene below. At the hase of the mountain, and pssaing directly through the town, is a beautiful stream of the purest mountain crystal, whose waters are as cold as the everlssting snow that feeds it. In the early spring, when the snows of winter recede beneath the persussive rays of old Sol, this stream, now so pesceful, so clear and harmless, becomes a hoiling, rushing torrent of sufficient capacity and power to propel the stamps of 20 mills, could they be placed upon its hanks. Upon the south bank of this stream, which is appropriately named Silver creek, is situated the quartz and saw-mill of the Exchequer company. Good mill sites are easily obtainable for three miles along its course and until its confluence with the Carson river, into which it empties.

The Town

Of Silver Mountain is admirably situated, and is without douht as healthy a locality as can he found in a year's travel. It is easily accessihle, heing upon the main road from the Calaveras Big Trees, and within nine hours' travel of the railroad terminus at Carson City, Nevada. Like msny another mining town on the coast, Silver Mountain hss had its many and varied experiences, its prosperity and adversity. The buildings that were erected here in the earlier period will compare most favorably with those of any mining camp on the coast under the same couditione. Fortunately, its foundation heing upon a rock and not upon the sand, it has weathered the storme of adversity in the past, by the merit of its mines alone has sustained itself, and after a severe and serious hattle with fate and fortune, which left it not without its scars, again comes forward in the new ers as a meritorious csndidate for public attention and favor.

About two miles distant from the town in a westerly direction, in what is known as the

Pennsylvania Canyon,

Is situated the mine hearing the same name. This was originally a locstioo of 2,000 feet on the lode, but now embraces additions] ground by an extension, also a parallel lode. In former times this mine was extensively worked, hut of lste years it has suffered the fate of many others near it, in having a resting spell of five or six yesrs. This company is of home organization, the controlling interest being held within the conuty, and the workmen who participated in the former developments being in msny oases officers and stockholders of the company. The amount of labor heretofore expended upon the property consists of a

Surface Tunnel

Driven along and with the lode for a distance of 500 or 600 feet, with cross-cuts at right angles cutting the lode at different places. The ore discovered at these points, while not rioh, was of sufficient quality for encouragement that at a greater depth an improvement would ensue, and from the massive proportions of the lode it would prove a mine that would practically he inexhaustible. The appearanoe of the lode on the surface and where penetrated by these cross-outs proved its identity as a true fissure vein, and measures were immediately inaugurated by these hardy miners and owners to commence a tunnel to he driven from near the canyon level, which, when completed, would cut the lode at a depth of 500 feet or more.

Accordingly and in due time the operation was begun, and, notwithstanding the financial condition of the men who were hearing this enormous expense, the tonnel was persistently driven until the total length hadreached a horizontal distsnce of nearly or qnite 1,900 feet, snd the lode penetrated by the tnnnel. So uniform in its general dip was the lode that the actual distance of the tonnel driven fell short but nine feet, when compared with the estimated distance by survey before the commencement of the lower tunnel, the lode at this poiot bearing well with its general featnres in the upper workings. Penetrating the lode at different points

The Ore Obtained

Was found to be quite uniform and evenly disseminated throughout the lode from wall to wall. This ore is an admixtnre of the ruby and hlack snlphuret of silver in nearly equal proportions, and while of comparatively low grade will amply repay the lahor of extraction and reduction when treated by an economical prooess that will desulphurize the ore. This, formerly, wss a very prominent mine, and lsrge sums could have heen obtained had the owners psrtaken less of the

Excitement of the Period

And more of discretion. Valuahle as their mine undoubtedly was, and still remains, that spirit of audacity pervading every new mioing camp wss visible here, fabulous prices being asked and reasonable offers refused. The mine having a genuine merit, it hss again been under examination and will doubtlese pass into other hands ere long. The former owners labored long and faithfully to develop their mine in the manner stated, and the uniform grade of the ore from upper to lower tunnels has decided it but a question of successful reduction, which, once solved, will enable this mine to rank with others far more prominent at the present time, capable of producing their quota of mineral wealth.

Metallurgical Processes at the Centennial.

Working Silver Ores.

EDITORS PRESS:—Your correspondent who heie hears "the burden of the day and the heat" for the benefit of your patrons, striving to select, in this great storehouse of man's ingenuity, such items as will he likely to prove most useful and pleasant to the special class who form the readers of the SCIENTIFIC PRESS, will devote this letter to a description of two distinct forms of that great industry of *milling ores*, so important and interesting to every resident of the coast. In a small building annexed to machinery hall the thunder of the "Nevada quartz mill" reverberates, and a curious and interested throng of spectators stands eagerly viewing the process of extracting the precious metals from the quartz which has been brought from the famous Comstock lode. The procese is thoroughly and fully demonstrated, and, even at the risk of repeating that with which many of your readers are already familiar, I will give a brief description of

The Mill and its Operations,

So that comparison may the more easily be made with the plan and working of the Chilsn machinery for the reduction and amalgamation of ores, as exhibited in a frame building erected for the purpose, west of machinery hall.

With a liherality which our California legislators unhlushingly failed to imitate, the State of Nevada appropriated $20,000 for the purpose of exhihiting her mineral specimens

MECHANICAL PROGRESS.

Hints for Steam Users.

Many things are simple and well known, and yet very important. Many simple things, although well known, are enforced by repetition. For these reasons we make room for a few hints to steam users from the *Iron Age*. They will not be new to most of our readers, and yet to read, remember and practice them will be valuable sometimes, even to the saving of life:

Among the recommendations of almost all the small engines in the market, we find the assertion that "it does not require a skilled man to run it." "Our machine can be run by a boy," etc. Now, good machinery needs good care, no matter how simple it is. There may be no danger of explosion, the machine may require little attention and almost "run itself," yet it should have good care. What constitutes good care we shall endeavor to explain briefly.

Oiling.

Abundant lubrication with good oil is a prime requisite. We place this first, because the mistaken idea only too generally prevails that any kind of oil will answer, provided enough is used to keep the bearing surfaces from "squeaking." The steam user who follows this policy will do so to his cost. The oil used should be the best. We do not believe there is any economy in attempting to use a cheap oil to lubricate any kind of machinery.

Most engines of the present day, no matter how small, are fitted with oil cups, and many engineers take it for granted that if the cups are filled once in so often it is all right. It may be all wrong. What a bearing needs is a proper quantity of oil constantly supplied to it, and not to be flooded one day and dry the next. It may happen that the cups do not work as they should. The bearing may not get enough, and the oil in the cup last too long, or the cup may deluge the bearing at first and then let it go dry. We have seen a cup intended to run a certain bearing for a month and supply it with plenty of oil, which invariably emptied itself in a week, while other cups beside it would work as they were intended to. The result was that a green hand, trusting the cup to do its work like the others, ruined the bearing entirely.

Cleaning.

An engine or machine should never be allowed to become dirty. Thorough cleaning requires very little labor, and only a little attention now and then. An engine or machine which has always been kept clean, protected from rust, and not abused in any way, is worth, when second-hand, very much more than another which has had little attention, been allowed to rust and to take care of itself generally.

Boilers.

The boiler is at once more expensive and more easily destroyed than the engine itself. Very often it receives the least attention, and would have even less were it not for the fact that utterly neglected boilers do at times explode with inconvenient effect. Most of the small engines in the market are provided with safety boilers, so that the danger from explosion is very small. A boiler should not be blown off and filled with cold water while hot. Blowing out under pressure does not seem to be a desirable practice. The heating surfaces of the boiler should be kept as clean as possible. A very thin deposit of soot makes a great difference in the amount of heat transmitted. In getting up steam when the boiler is cold, it is well to avoid too much haste. One part may be over-heated while another part is cold, resulting in strains. The valve should be closely looked after.

Firing.

Firing is an art to be acquired by all steam users. It was once thought that anybody could fire, and he was supposed to be a good fireman who could keep steam constantly blowing off from the safety valve. It is now understood that he is the best man, other things being equal, who can get the most work with the least coal. Boilers of small engines vary so much in construction and requirements that particular directions in regard to them would be useless. To keep an even pressure of steam, and have but a small body of coal on the grate when it is time to draw the fire, are points that should receive attention.

Care.

A leak should never be tolerated for a moment. The matter may in itself be trifling, but the results may be the destruction of the boilers. The drip from a valve, or steam pipe, or joint, should never be allowed to fall upon the boiler, because of the rapid corrosion which a drip of any kind causes. A very slight leak is often sufficient to cause a severe grooving of the plates, necessitating costly and troublesome repairs. We may be expected to say something about low water, but upon this subject we think there is very little to be said, save that in some boilers a very slight fall of the water level is sufficient to expose the crown sheet, and, with a sharp fire, to ruin the boiler in a short time. The steam user should study his engine, and acquaint himself with all its peculiarities, and if he exercises an intelligent observation he will soon learn what attention it needs, and how such attention should be given.

Condensed History of Steam.

About 280 years B. C., Hero, of Alexandria, formed a toy which exhibited some of the powers of steam, and was moved by its power.

In 540, A. D., an architect arranged several caldrons of water, each covered with the wide bottom of a leather tube, which rose to a narrow top, with pipes extended to the rafters of the adjoining building. A fire was kindled beneath the caldrons, and the house was shaken with the efforts of the steam ascending the tubes. This is the first notice of the power of steam recorded.

In 1543, June 17, Brasco de Garay tried a steamboat of 200 tons with tolerable success, at Barcelona, Spain. It consisted of a caldron of boiling water, and a movable wheel on each side of the ship. It was laid aside as impracticable. A present, however, was made to Garay.

In 1630 the first railroad was constructed at Newcastle-on-Tyne.

The first idea of a steam engine in England was in the Marquis Worcester's "History of Invention," A. D., 1663.

In 1701 Newerman made the first engine in England.

In 1764 James Watt made the first perfect steam engine in England.

In 1766 Jonathan Hulls first set forth the idea of steam navigation.

In 1778 Thomas Payne first proposed the application in America.

In 1781 Marquis Jouffrey constructed a steamboat on the Saone.

In 1781 two Americans published a work on it.

In 1789 Wm. Symington made a voyage in one on the Forth and Clyde canal.

In 1802 this experiment was repeated.

In 1782 Ramsey propelled a boat by steam at New York.

In 1789 John Fitch, of Connecticut, navigated a boat by a steam engine on the Delaware.

In 1794 Robert Fulton first began to apply his attention to steam.

In 1783 Oliver Evans, a native of Philadelphia, constructed a steam engine to travel on a turnpike road.

The first steam vessel that ever crossed the Atlantic was the *Savannah* in the month of June, from Charleston to Liverpool.—*Hunt's Merchants' Magazine.*

Russian Mechanical Education.

President Runkle of the Massachusetts Institute of Technology, on the recent visit of the school to the Centennial, was deeply impressed with the Russian system of shop-work instruction for engineers and machinists, which is very clearly shown in connection with the exhibits of the imperial technical schools of St. Petersburg and Moscow. He thinks the Russians are developing an idea of great value and importance in their system of technical education, which should be introduced in the similar schools of this country as soon as possible. To explain the matter fully, he has just published a pamphlet, which our readers will do well to examine.

The Russian idea is to educate young mechanists and engineers by means of *instruction* as opposed to *construction* shops. The instruction in the different classes of work—forging, filing, turning, etc.—is given in different shops. Each instruction shop is managed by an expert, who makes the selections and carefully grades the course of practice in his own shops.

The mechanism which the student manufactures is selected solely with reference to the most rapid development of his skill, and no effort is made to sell his practice work. The time which it is necessary to devote to the manufacture of each particular piece is known by experience. The student is allowed the proper time for his work, and it is not wasted. All the students in the same shop produce pieces which are essentially alike at the same time. The expert in charge informs them all at once of the most approved method of producing the piece, sees to it that all the necessary facilities are in readiness, and is present while they work.

STEEL FOR SHIPS OF WAR.—Another step in advance in shipbuilding has been taken by the introduction of steel for the hulls of war ships, by which a great diminution of weight will be gained and consequent speed. The contract for the first six vessels of this new build has been given to the important firm of Elder & Co., of Glasgow. They are to be corvettes of 2,300 tons, and will carry fourteen guns. The steel hull will be sheathed with two thicknesses of teak and coppered externally, and the craft is intended for service on foreign stations. The machinery and boilers will be protected by a strong armored deck, and it is expected that the corvettes will be able to maintain the high speed of twenty miles an hour. Should this expectation be realized, we shall have in these strong and handy ships a most efficient convoy for our commercial marine in war time, and no less efficient instruments, were the declaration of Paris out of the way, for sweeping the seas of the commerce of the enemy. The present order will, as far as it goes, reanimate the depressed shipbuilding industry of the Clyde; but the plates will be rolled at Sheffield, or in some other of the English steel-making districts.—*Iron.*

AMERICAN ENGINES IN HOLLAND.—The first American steam engine in Holland was sent there some six months ago. The firm which received it has since ordered seven more.

SCIENTIFIC PROGRESS.

Men of Science at the Centennial.

The *American Journal of Science and Art* compiles an interesting list of the noted scientific men who are honoring our country with a visit this summer. It says: No occasion has before drawn together so many distinguished men of science from abroad, in various departments, as the Centennial exhibition at Philadelphia. Without attempting to enumerate all whose names might properly be mentioned in this relation, we recall, from Great Britain, Sir William Thomson, the well known physicist, who is President of the Judges on the XXVth Group—Instruments of Precision and Research; Sir John Hawkshaw, the eminent engineer who was last year President of the British Association; Sir Charles Reed, President of the XXVIIIth Group of Judges—for Education and Science; Capt. Douglas Galton, President of the Judges under the XVIIIth Group—Railway Plans, etc.; Mr. Isaac Lowthian Bell, the most eminent iron metallurgist in Great Britain, and author of the well known treatise on the "Chemistry of the Blast Furnace," President of the Judges of Group I.—Minerals, Mining Metallurgy, etc.; Dr. William Odling, Wayafiete Professor of Chemistry in the University of Oxford, Secretary of the Board of Judges on Group III.—Chemistry and Pharmacy, etc.; from Sweden, Prof. Adolf E. Nordenskiold, Prof. C. A. Angstrom, Polytechnic Institute, Prof. O. M. Torell, Chief of the Geological Survey of Sweden, and Richard Akerman, of the Royal Swedish School of Mines, all from Stockholm, under whose immediate superintendence the excellent geological, mineralogical and metallurgical display of Sweden, at the Exposition, has been made; from Russia, Major-General Axel Gadoline, an eminent engineer, and Prof. L. Nicbolsky, Mining Engineer and Professor at the Mining School at St. Petersburg, who is in charge of a systematic collection of Russian minerals—the only systematic mineral collection in the Exposition; from Germany, Dr. Wedding, Royal Prussian Counsellor of Mines, Dr. Rudolph Von Wagner, the well known editor of *Wagner's Jahresbericht*, and Dr. G. Seelhorst, of Nuremberg; from France, Mr. L. Simonin, J. F. Kuhlman (*fils*), M. E. Levasseur, and M. Emile Guimet, of Lyons; from Italy, Prof. Emanuel Paterno, of Palermo; from Mexico, Mariano Barcena, the mineralogist.

NEW RAYS OF CALCIUM.—Mr. Lockyer, in a letter to M. Dumas, says: "I have recently carried out a series of experiments upon calcium, employing at first a small battery and a small coil, and afterward a large battery and a large coil, and to avoid all doubts I photographed the results. I found that with the small coil I was able to obtain a photograph which only contained the ray in the blue, without any trace of the ray in the violet; and with the largest battery and the largest coil I obtained a photograph containing the rays of the violet without any trace of the ray in the blue, and that by varying the surface of the battery I was able to get a spectrum resembling the absorption spectrum of calcium in the sun. These results agree so completely with those of the dissociation of a salt of calcium that I have asked myself the question if we have not here before us a dissociation of the calcium itself. Naturally we are unable to determine, for the present, whether we have a lower molecular group of calcium, or whether the calcium itself is a compound of two distinct sub-elements, if the expression may be used. It seems that we can only undertake to solve this question by photographing the rays of the calcium (H_1 H_2) in different stars. If we find that they present always the same relative breadth and intensity there will be a strong presumption that we have met with a decomposition of calcium, or, in other terms, we shall have shown that a spectrum of rays is a spectrum due to different orders of molecular grouping. If, on the other hand, we find that these lines vary in breadth and in intensity, it will be difficult to explain this phenomenon except we admit that calcium, instead of being an element, is really composed of two substances.—*Comptes Rendus.*

PROFESSOR OF THE NATURAL SCIENCES.—An American gentleman of considerable national notoriety lately visited England bearing letters of recommendation, in which he was styled "Prof. of the Natural Sciences." The first English savant upon whom he called and presented his credentials, advised him as a friend to not present such papers, for, said he, "It's a good deal in his country to be a professor of chemistry; it's a great thing to be a professor of geology; and the magnitude of a professor of astronomy is something not easily measured. But when you are recommended as a professor of all these and much more, the idea is overwhelming."

ZOOLOGICAL GARDENS FOR NEW YORK.—During the coming winter an effort will be made to organize a society, with a capital of over $200,000, for the formation of zoological gardens in New York. It is hoped by the movers that the Legislature will empower the commissioners to set aside a portion of Central Park for such gardens, but the commissioners themselves are opposed to this at present, claiming that they cannot afford room. The zoologists hope to convince them to the contrary.

Prof. Huxley's Views of America.

As is generally known, perhaps, Prof. T. H. Huxley, the famous Englishman of science, is making a flying visit to this country. He was present at the recent meeting of the American Association for the advancement of science and made a brief speech showing his kindly appreciation of our country and our people. He said:

Since my arrival in this country, I have learned a great many things, more, I think, than ever before in an equal space of time in my life. In England, we have always taken a lively interest in America; but I think no Englishman who has not had the good fortune to visit America has any real conception of the activity of the population, the enormous distances which separate the great centers; and least of all do Englishmen understand how ideatical is the great basis of character on both sides of the Atlantic. An Englishman with whom I have been talking since my arrival says: "I cannot find that I am abroad." The great features of your country are all such as I am familiar with in parts of England and Scotland. Your beautiful Hudson reminds me of a Scotch lake. The marks of glaciation in your hills remind me of those in Scottish highlands.

I had heard of the degeneration of your stock from the English type. I have not perceived it. Some years ago one of your most distinguished men of letters, equally loved and admired in England and America, expressed an opinion which touched English feeling somewhat keenly—that there was a difference between your women and ours after reaching a certain age. He said our English women were "beefy." That is his word, not mine. Well, I have studied the aspect of the people that I have met here in steamboats and railway carriages, and I meet with just the same faces, the main difference as to the men being in the way of shaving. Though I should be sorry to use the word which Hawthorne did, yet, in respect to stature for fine portly women, I think the average here fully as great as on the other side. Some people talk of the injurious influence of climate. I have seen no trace of the "North American type." You have among you the virtue which is most notable among savages, that of hospitality. You take us to a bountiful dinner, and are not quite satisfied unless we take away with us the plates and spoons. Another feature has impressed itself upon me. I have visited some of your great universities and meet men as well known in the old world as in the new. I find certain differences here. The English universities are the product of Government, yours of private, munificence. That among us is almost unknown. The general notion of an Englishman when he gets rich is to found an estate and benefit his family. The general notion of an American when fortunate is to do something for the good of the people and from which benefits shall continue to flow. The latter is the nobler ambition.

It is popularly said abroad that you have no antiquities in America. If you talk about the trumpery of three or four thousand years of history, it is true. But, in the large sense, as referring to time before man made his momentary appearance, America is the place to study the antiquities of the globe. The reality of the enormous amount of material here has far surpassed my anticipation. I have studied the collection gathered by Professor Marsh, at New Haven. There is none like it in Europe, not only in extent of time covered, but by reason of its bearing on the problem of evolution; whereas before this collection was made, evolution was a matter of speculative reasoning, it is now a matter of fact and history, as much as the monuments of Egypt. In that collection are the facts of succession of forms and the history of their evolution. All that remains to be asked is how, and that is a subordinate question. With such matters as this before my mind, you will excuse me if I cannot find thoughts appropriate to this occasion. I would that I might have offered something more worthy; but I hope that your association may do what the British association is doing—may sow the seeds of scientific inquiry in your cities and villages, whence shall arise a process of natural selection by which those minds best fitted for the task may be led to help on the work in which we are interested. Again I thank you for your excessive courtesy, and I may almost say affectionate reception.

METALLIC OSMIUM.—At the session of the academy of sciences, on the 8th of May, were exhibited several specimens of metallic osmium, prepared by M. Henri Ste. Claire Deville. This osmium is of a blue shade, tinged with gray, showing violet if light is reflected several times upon its surface. Osmium is stated to be the most dense matter known; it is hard enough to scratch glass easily. In the preparation of crystallized osmium, the vapor of osmic acid several times distilled is passed over pure carbon. To get this, benzine vapor is decomposed by causing it to pass over a tube of red porcelain, upon which coherent carbon is deposited as a hollow cylinder. The osmic acid vapor is afterwards introduced, carried in by nitrogen. The osmic acid is reduced, giving carbonic acid and osmium, which soon lines the inside of the carbon cylinder, ending by completely transforming the latter into carbonic acid, and depositing the metal. Tubes of osmium are thus produced of a nature analogous to the cadmines of oxide of zinc obtained by burning zinc vapors issuing from a hole in the cover of a crucible in which zinc is boiling

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

THE NEW MILL.—Alpine *Chronicle*, Sept. 2: We stated last week that estimates were being prepared for the erection of a 20-stamp mill for the I X L company. The contract has been let to N. D. Arnot, of the Vulcan iron works, San Francisco, who is now here making arrangements to commence the work. The mill is to be a 20-stamp one, and will be furnished with the latest milling improvements. Mr. Arnot already has some of the machinery on the way from San Francisco, and will have all the works on the ground within 50 days. The new mill is to be erected on the beautiful flat known as Nye's ranch, about half a mile below Silver mountain, and is to be completed and in working order within 120 days. The erection of this mill will be watched with much interest by all interested in mining operations in this county. The reputation of the contractor and the Vulcan iron works is a sufficient guarantee that the I X L will be a model mill.

AMADOR.

MECHANICS' MINE.—Amador *Ledger*, Sept. 9: This mine, situated just outside the limits of Sutter Creek, is to be started up shortly. The owners are preparing to incorporate, with 33,000 shares at $1 per share. Ten thousand shares will be thrown upon the market to provide the necessary working capital; the stock, however, is to be exempt from assessment for a period of six months, the development of the property to be carried on in the interval by the original owners. This is about the scheme proposed by the articles of incorporation which have just been prepared. Considerable work has already been done on the 'Mechanics' mine, with results that ought to justify its further development. One shaft has been sunk to the depth of 130 feet, and a drift 100 feet from the surface has been pushed a distance of 100 feet. One crushing of the rock taken from this drift yielded at the rate of $22 per ton. Two later crushings yielded $5.50 and $6 per ton respectively. The reduced quality of the ore in the last tests is accounted for by a break in the ledge. The owners are sanguine that the ore body will recover its richness as development proceeds.

NEW QUARTZ MILL.—We are informed that the owners of the Crown Point mine, located at Drytown, have commenced the erection of a new quartz mill. We believe it is to run 10 stamps. The Crown Point is regarded by expert miners as the future mine of that neighborhood. A dispute about the ownership has been settled, leaving Messrs. Burke, Smith, Lewis and others in possession. They are determined to ascertain by actual working what the property is worth without delay.

QUARTZ EXCITEMENT.—There has been no little excitement in quartz discovery lately in Amador City, owing to the striking of rich ores on the North Gover claim, which we reported in our last issue. The new mine promises to be a valuable one, especially as it adjoins one of the most productive mines in the county—the Gover. Under the stimulus of this find all the unclaimed land in the district has been taken up.

BIG YIELD.—At the last clean-up at the Gover mine upwards of $2,000 was realized from a crushing of 60 tons of rock, averaging $35 per ton.

BUTTE.

GOLD.—Oroville *Mercury*, Sept. 8: O. P. Powers' company cleaned up this week after a 15 days' run, and found on hand $1,500. During the coming month no work will probably be done on the claim, as the ditch needs enlarging and all hands will be at work on that.

CALAVERAS.

GLENCOE CON.—Calaveras *Chronicle*, Sept. 9: Ore, sparkling with free gold, has been struck in the north level of the central shaft of the Glencoe Con. mine, in Glencoe district, some 10 feet below water level. A few days ago the superintendent, F. Sletcher, Esq., discovered a fine body of first-class ore on the northern portion of the mine, which is now being developed. One of the men employed there states that the discovery is a big thing and the ore worth $40 per ton.

MAGNETIC IRON ORE.—Mr. G. P. Wesson, of this place, has lately discovered a deposit of magnetic iron ore near town. The deposit is said to be very extensive and the ore is certainly extremely rich in iron. Other varieties of iron ore—notably brown hematite—have been previously discovered in this vicinity, but we believe this to be the first instance of the finding of the black oxide of iron. The deposit is valuable.

MILL STARTED.—The mill at the Duryea gravel mine, in Chile gulch, was set in motion on Tuesday last. The battery is composed of five 600-pound stamps. The motive power is furnished by an eight-foot hurdy-gurdy wheel, which is run by water under 300-ft pressure. But very little water is required to run the mill with the great pressure available, from 10 to 15 inches suffices. The machinery runs as well as could be desired, everything connected with the mill being erected in the most substantial manner. Mr. John Rider, the well-known millwright, superintended the work, and machinery put up by him always performs satisfactorily. Simultaneously with the completion of the mill, Messrs. Rigney, Kelly & Co. commenced upon their contract for taking out 5,000 cal loads of gravel, and the stamps were immediately set to work. The battery is to be kept running day and night, Mr. A. B. Pickering, of Railroad Flat, having charge of the milling operations. We confidently expect that the yield of the Duryea claim, large as it has been in the past, will be greatly augmented by the facilities for crushing the grevel now in active operation.

INYO.

ABOUT READY.—Inyo *Independent*, Aug. 29: After undergoing a very thorough overhauling the Kearsarge mill is now ready for operations, and was to start up to-day, or early next week at the latest. It is but a waste of time to prognosticate as to results, but still from what we hear as to the amount and character of the ore on the dump and in sight in the mine, we feel well assured of a very satisfactory run.

LOG SPRINGS.—Messrs. Broder and Moffat have a small force at work upon their mine at Log springs, upon the developments of which depend the furnace operations. It takes rich ore now and plenty of it to justify running the furnace, since silver is at such a discount. This discount is about equivalent to the whole cost of freighting the bullion to San Francisco, in effect doubling that charge as compared to former rates. The prospects in the mine are quite fair, but not enough is shown yet to be considered satisfactory or conclusive either way.

KERN.

THE BUNNEL MINE.—*Southern Californian*, Sept. 7: It was confidently rumored that a compromise had been effected between the claimants to the Bunnell mine. What was known as the Bunnell mine, after it was opened and proved to be of value, it will be remembered, was seized and held by a party of armed jumpers, the latter alleging that the mine was on ground which they had previously located and still claimed. Appeal was had to the courts, and finally the case was transferred to the United States Circuit Court. Last week the case came up for adjudication, but was continued till December. The Bunnel company, being driven out of their mine, went to another part of the lead where there could be no dispute, made an opening and found the lead as rich as ever. Since that time they have prosecuted work upon it, and Mr. Hawley, a mining capitalist, has been induced to erect a mill, and is now a large owner in the mine. A fine mill has been built at a cost of some $70,000, which is now ready for operation, and the work of reduction will at once begin. The compromise alluded to is said to be upon the following basis: Both the claimants are to consolidate all their mining interests, water privileges, etc., upon which capital stock shall be issued to the amount of 10,000,000 shares, of which the Bunnel claimants shall receive three-fifths, and the adverse claimants, or jumpers, two-fifths. The first surplus then received from the reduction of rock shall be applied to the payment of the cost of the mill, and no dividend shall be declared till that first cost is liquidated. The proposition to consolidate and cease litigation, as we have heard it, came from the jumpers. The Bunnel company, however, made the condition of the first product going to the payment for the mill, which, we believe, has not yet been assented to by the party making the proposition. We think it quite probable, however, that this will be the basis of the compromise.

MARIPOSA.

WASHINGTON.—Mariposa *Gazette*, Sept. 9: At this flourishing mine, which is one of the rich resources and auxiliaries to the wealth of the county, ore crushing has been suspended for some time past, for the purpose of making sundry repairs and improvements on the mill. During the stoppage no time has been lost in the mine, the usual force having been employed in extracting ore and sinking the main shaft, which is now down and will be continued to a depth of 1000 feet. The mill being again in fine condition and with renewed and increased facilities, work was fully resumed about 10 days ago. The mine, with its belongings, gives employment to 125 men in the various branches of mining, milling, teaming, wood-chopping, etc. The works are still under the general superintendence of Mr. Geo. E. Webber, ably assisted by Moses L. Rogers as mining foreman.

CAMPODONIA.—This mine, which is located near the town of Hornitos, has a 10-stamp mill upon it, and grinds about 10 tons every 24 hours. A friend informs us that it is worked on a most economical scale, only one white man and three Chinamen being employed about the mine and mill. The chinamen supply the mill with 10 tons per day, which pays $15 per ton. This is an old mine upon which a great amount of work has been done. Evidently its owner has paid well for his learning how to work a quartz mine, and now has it upon a paying basis.

NAPA.

QUICKSILVER.—St. Helena *Star*, Sept. 8: B. U. M. Co. shipped 29 flasks of quicksilver this week, making a total of 84 during the last month. This is considered very good for the number of men they have at work and the quality of ore they are at present smelting.

NEVADA.

BIG CLEAN-UP.—*Foothill Tidings*, Sept. 9: The Centennial company, of whose operations on Osborn hill we have spoken several times of late, recently took 17 loads of rock—such as they are taking out while prospecting—to Smith's mill and had it worked. The result came in day or two since in the shape of a gold brick worth over $1,800, and the sulphurets not yet worked, will, it is estimated, make full $2,000 for the run—at the rate of about $118 to the load. The ledge we understand seems a permanent one and this result of the first clean-up ought not only to encourage the owners of the Centennial but to induce others to prospect.

AT SEBASTOPOL.—San Juan *Times*, Sept. 9: The American mining company, at Sebastopol, are working to their utmost capacity, under the able control of George O. Spooner, superintendent. The company are washing through their new shaft and tunnel. Our reporter intends visiting the mines shortly and will give our readers hereafter a full description of the mine, etc.

QUARTZ IN WASHINGTON TOWNSHIP.—Nevada *Transcript*, Sept. 9: The quartz interests in the upper part of the county are brightening up. From different districts we are receiving intelligence of good paying ledges being struck. In Washington township especially, is quartz mining coming to the front. We are informed by a gentleman just down from the vicinity of Fall creek, that the Yuba mine, situated on the bank of the South Yuba river, and owned by Coleman Brothers & Co., have struck a pay chute of rock in their claims, which has been uncovered for a distence of 300 feet, and prospects taken from different places on the ledge show the rock to be exceedingly rich in free gold and sulphurets. To use our informant's own language, "its perfectly lousy." $200,000 have been offered and refused for this mine. They have a fine 15 stamp mill running night and day, and intend to increase the capacity to 30 stamps in a short time. On the opposite side of the river, and about 1,500 feet above the river, is situated the Lindsey mine. Considerable work has been done on the ledge for several years past, but with poor success, until the claims fell into the hands of the present owners, who, by sinking the incline deeper and running cross-drifts, have opened up a fine body of ore, eight feet thick, which pays from $40 to 50 to the ton, mill process. The owners of the mine have just had a new mill built, by E. A. Wetmore, of this city, which gives good satisfaction, every part working smoothly and evenly. It is now generally conceded that the ledge of the Lindsey mine is a continuation of the Yuba mine, the character of the rock and the thickness of both ledges proving it.

ACCIDENT AT THE FRYER WORKS.—Nevada *Transcript*, Sept. 10: On Thursday, while a charge of Meadow Lake ore was being run through the large furnace at the Fryer works, between here and Grass Valley, Mr. R. M. Fryer opened the door to look down at the fire. About the time the door opened a huge sheet of flame rushed out and struck Mr. Fryer in the face, seriously, although not dangerously, burning his face, neck and hands. It is thought that there must have been an explosion of the gases arising from the rock, and that it was caused by the opening which gave them vent. The burned portions were covered with paint as soon as a doctor could be secured, and Friday Mr. Fryer was feeling better, and was in hopes to be out in a few days. In this connection it might be well enough to state that rock is being worked most of the time at the old works on the mine below Grass Valley, and we are informed, both by the company and by employees, that the results prove in every instance that the Fryer method of treating both free and rebellious ores will work right up to a fire assay, whether the quantity be large or small. There have been found many defects in the working of the machinery, and numerous changes have had to be made, but we are informed that the principle of working has at all times been perfectly satisfactory.

PLACER.

MINING ITEMS.—Dutch Flat *Forum*, Sept. 7: The work of fitting up the Polar Star claim is completed and water was turned on yesterday. The Franklin, Lakamp, and the claims of the Gold Run hydraulic mining company, limited, continue washing a few hours each day. The water running in the ditch of the South Yuba canal company will be turned off on the 15th inst. for the purpose of repairs. This will stop all further washing for the season. The Yankee tunnel was advanced 44 feet last week. Total for August, 160 feet, at a cost of $22.79 per foot. The Baker shaft was sunk 12 feet last week. Total for August, 66 feet (32 feet of which was in bedrock, the balance in gravel); the cost was $16 per foot.

ST. PATRICK.—Placer *Herald*, Sept. 9: The St. Patrick mining company, whose mill was destroyed by fire week before last, are making preparations for the erection of a new mill at once. For the present they have leased Pugh's mill, near the town of Ophir.

THE boys who have been opening the old Peter Walter mine are now taking out ore. They expect soon to make a crushing, when they say they will give us an item worth recording.

WE were shown a few days ago by H. Adams some specimens of rusty, decomposed quartz, which he informed us prospected very rich. The ledge from which it came is somewhere in the vicinity of Clipper Gap, and is at least six feet thick.

PLUMAS.

LIVELY WORK.—Plumas *National*, Sept. 9: They have had a lively time in the hydraulic claims at Dutch hill last week. The big pipe was taken with a fit of "bucking," and knocked one man into the flume, and then whirled round and commenced prospecting for more men to conquer. There was a lively scattering of the hands in the cut, and for a while it was feared that serious damage would result, but by hard labor the "water spirit" was brought under subjugation and made to work again as usual.

SANTA CRUZ.

GOLD MINING.—Santa Cruz *Courier*, Sept. 8: For a long time it has been known that gold, both in quartz and gravel, existed in the neighborhood of the San Lorenzo river, six or eight miles above Santa Cruz. Many years since a rich deposit of gold was found in a large boulder in the same neighborhood; this discovery induced the erection of a five-stamp mill, and the running of an extensive tunnel to find the vein. Some $32,000 in gold was extracted from the boulder, but this sum and much more was spent in fruitless explorations, and the company retired in disgust. Placer gold deposits have been found since that time on the margin of the San Lorenzo river, and worked with more or less success for a year. Last year a gentleman named Jones discovered a gold-bearing quartz ledge near the locality of the rich boulder above alluded to, on the land of George Treat. No effort has been made to test its extent and richness, though mining experts who have examined it declare it as their belief that the discovery is a true fissure vein and rich in gold. Mr. W. N. Cummings, who has had a large experience in mining operations all over the coast, is satisfied that the ore will pay handsomely to work, but inclines to the opinion that no true vein exists in the locality, and that the ore found is in pockets. He proposes to test the matter thoroughly, however, and we understand will send a ton of the ore to San Francisco to be worked. Meantime the old tunnel will be prospected, as it is asserted by some that in mining it a quartz vein was cut.

SHASTA.

RICH DIGGINGS ON THE SACRAMENTO.—Yreka *Journal*, Sept. 6: At Shenanigan gulch, a tributary of Slate creek on the Sacramento river, two men took out 40 ounces of gold dust in one day last week, with at least $2 000 more in sight. The discoverer of this rich spot, whose name we could not learn, and a man named Turner, believed there must be rich diggings above a rich claim worked on Slate creek by a man named Moore and another person some years ago. On prospecting around a little they came upon a thin streak of dirt between slate, which resembled yellow ochre, and as they dug down, the lead kept widening to about two feet wide at last accounts, and still widening as the work progressed. Should this streak of pay dirt prove extansive, we may look for a vast amount of gold from that mining section, and it is doubtless probable that other such streaks may be found in the gulches and ravines all along the Sacramento river running through the northern portion of Shasta county and into Siskiyou county. The gold taken out is also of a yellow ochre appearance. At Portuguese Flet, the present season, several large nuggets have been found, and flattering prospects have also been found at various points in the Sacramento river mining region. At Dog creek, the tunnel run in to strike the pay gravel, is now nearly completed, so we learn, and when finished, the enterprise costing more than was at first anticipated, on account of finding more water than expected. We sincerely hope that the Sacramento river diggings may prove rich and extensive, for in their success will Siskiyou be afforded another good market for our farmers, lumber men and producers generally.

SISKIYOU.

GOOD LEDGE.—Yreka *Journal*, Sept. 6: The workmen cutting the tunnel into the Empire quartz claim at Empire creek, near Humbug, have struck lots of water and a good paying ledge two feet wide. The company keep two shifts steadily at work night and day, and will soon be able to take out plenty of good paying quartz.

SONOMA.

MT. JACKSON MINE.—*Russian River Flag*, Sept 7: The three Eames furnaces were started up about three weeks ago. Two of them have run uninterruptedly ever since, night and day. In the third furnace a flange was broken from the cam rod, causing about a week's delay. All are running at present. Although 30 tons can be run through per day, 18 is deemed the most advisable amount for a day's work at present. The ore on the dump ready to be used is estimated at 3,000 tons, and will be sufficient to supply the three furnaces all winter, even though no more be taken from the lead. The network of tunnels is so arranged that 100 men can be put to work getting out ore if desired. The ore is easy worked and apparently inexhaustible. A shipment of 27 flasks was made last week. From the yield now being realized they will ship about 25 flasks per week. Everything is working satisfactorily, and the mine promises a continuous yield from the Eemes furnaces.

TRINITY.

FINISHED.—Trinity *Journal*, Sept. 7: Miners everywhere in the county have about completed the season's work, the clean-ups invariably proving satisfactory. Money, however is not as plentiful as had been anticipated.

NUGGETS.—Jack Reed, of Mineraville, recently picked up a 9¾ ounce piece of gold in his claim below the mouth of Dutch gulch. F. Bates, of the Minersville store, brought in a nice lot of dust last week, among which were several large pieces.

RICH QUARTZ.—From P. Van Matre we learn that Jack Muncy and another man have lately discovered some very rich quartz on Deadwood gulch, near the lead which has been worked for some time past by George Kloin. Muncy obtained $6 from 12 pounds of the rock, or at the rate of $1,000 per ton. They have sunk on the lode about 25 feet, and it is now eight inches in width and widening as they go down on it. An arastra has been erected and is now in operation.

BULLYCHOOP.—Mr. Henry Spiegelburg, of Indian creek, informs us that quartz matters at Bullychoop are looking very bright and prospects are daily improving. The Original Bullychoop company are now negotiating with parties from below for the erection of a mill of eight tons per day crushing capacity, the parties proposing to erect such a mill for one-fourth interest in the mine. In the Byron mine a vein of quartz eight inches wide has been found, which pays as high as $1.50 to the pound. Ten dollars per day has been made out of this rock by crushing it by hand. In the Wild Pigeon mine the lode is eight feet wide and prospects very well. Mr. Spiegelburg is in high hope and thinks that Bullychoop will yet make a noise in quartz mining circles.

TUOLUMNE.

A GOOD HAUL.—Tuolumne *Independent*, Sept. 9: Blas L. Radonich, the "pocket expert" and lucky miner, has taken out of the "old Patterson vein" over $5,000 the past three weeks. Some of the gold is in beautiful crystallized quartz, containing many rare specimens. We have also been shown pieces weighing several pounds, two-thirds of which being solid gold. Blas has suspended operations for the purpose of driving a tunnel to strike the vein at a depth which makes it necessary to drain the shaft.

Nevada.

RYE PATCH DISTRICT.

IMPORTANT DISCOVERY.—Cor. *Silver State*, Sept. 7: The mines never looked better, with the Rye Patch company at the head, with new and powerful machinery to work their mine to a greater depth than has been attained yet in Humboldt county. The most important news I can relate is that of a new find by those veteran prospectors, "Jackass" Louis and Martin Kearny. This new mine, which will greatly add to the bullion production of Humboldt, is called the Washington. Specimens of rich chloride have been struck, and enough of this valuable milling ore is now in sight to keep a ten-stamp mill running for at least a year. The fortunate possessors of this important strike are going to devote all the spare time they have to develop their find, and bring to the mill what ore they now have in sight.

RYE PATCH BULLION.—The Ryo Patch mining company shipped last Wednesday, bullion valued at $6,300, the result of one week's run with five stamps, one of the batteries being out of repair.

REPAIRING.—The Rye Patch mill has been shut down for repairs. The engine, which has been out of order for some time, is being put in first-class condition.

ANTELOPE DISTRICT.

MANHATTAN MINE.—Eureka *Sentinel*, Sept. 6: Billy Wheelan dropped in yesterday from Antelope district to tell us of the progress being made there. The Manhattan is his claim, and he informs us that it is one of the very best between here and the railroad. The ledge is traceable at short intervals for a distance of three miles. Billy has a shaft down on his claim to the depth of 57 feet. At 26 feet he lost his ledge, but at the above depth it came in again and is now strong and well defined. The ore assays about $65 per ton, and will be easily milled. It is almost a facsimile of the Hidden Treasure ore on Treasure hill. The work of development has been laid over for the season, but the indications warrant the belief that the Manhattan is a valuable mine.

WHITE PINE DISTRICT.

THE TUNNEL.—White Pine *News*, Aug. 26: Captain Frank Drake, superintendent of the Eberhardt & Aurora company's mill and mines, after an absence of several weeks in San Francisco, returned home the first of the week. While absent he made arrangements for extensive and powerful machinery for driving his tunnel through Treasure hill, which is now being prosecuted as fast as possible. The size of the tunnel is seven feet high and nine wide, with double tracks.

BULLION SHIPPED.—During the week the Eberhardt & Aurora company have shipped by Wells, Fargo & Co., bullion amounting to $20,355.16.

WARD DISTRICT.

READY TO MOVE.—White Pine *News*, Aug. 26: From Ned Hauser, who returned from Troy on Tuesday last, we learn that the Martin White mining company, of Ward, who recently purchased the English company's mill and other property at the former place, have it all taken down and ready to be shipped to its future destination. Three teams, carrying 60,000 pounds, had loaded up and were ready to start. The mill will be erected as soon as the machinery can be hauled to Ward district.

JERSEY DISTRICT.

THE JERSEY.—*Silver State*, Aug. 28: The Jersey mine, recently leased by a Salt Lake company, continues to improve as depth is attained. Some 30 men are now employed in extracting and assorting the ore. The first-class ore is being shipped to Salt Lake at the rate of about 15 tons a week, and the inferior ore is piled on the dump to be reduced by smelting or concentrating.

BULL RUN DISTRICT.

A GOOD MINE.—*Silver State*, Sept 5: The Blue Jacket mine, in Bull Run district, is proving itself to be valuable property. It was discovered in 18-0, and almost abandoned at one time, owing to the inability of the then owners to work it to advantage. The company are now employing about 100 men chopping wood to run the furnace during the winter. Notwithstanding this heavy expense, sufficient bullion was produced last month to pay all hands, including those at the mill and mine, and leave $5,000 to be divided among its owners.

WASHOE DISTRICT.

IMPERIAL CON.—Gold Hill *News*, Sept. 7; Daily ore yield, 40 tons; principally from the stopes and breasts of the north winze below the 2000-ft level, which continue showing well both north and south, with improvement as further developed. Superintendent Hardy is pushing the main drift north at the 2000-ft level as lively as possible, in order to effect a connection with the Alpha drift for air circulation and working purposes. The air connection recently completed with the Bullion shaft is being utilized to good advantage by being sent down through the winzes to the 2000-ft level, and up and out through the incline, thus ventilating and cooling a very warm section. Total yield of the mine for August, 1,200 tons of ore, giving a bullion product of about $78,000, of which over one-half was gold.

CON. VIRGINIA.—The yield of ore is being largely increased, owing to better extraction and milling facilities. The shaft is in excellent condition down to the 1550-ft level, where the station has been enlarged and retimbered. The ore breasts and stopes are looking and yielding splendidly, and 150 tons per day is being hoisted through the Gould & Curry shaft. Two more mills are set to work on ore from this mine, and the usual monthly dividend of $2 per share is declared, aggregating $1,080,000. This of course, like two or three of its predecessors, has been paid out of the reserve in the treasury. Such a reserve is good to have. The south drift at the 1400-ft level is being retimbered. The mine is in a more prosperous condition than it has been for months.

JUSTICE.—Yielding 120 tons daily from the ore stopes of the 400, 500 and 600-ft levels, which continue looking and yielding well at all points, assays from the 400-ft level running as high as $300 to the ton. At the 800-ft level, cross-cut No. 1 east has its face now in a fair quality of milling ore which shows constant improvement as further cut into. Cross-cuts Nos. 2 and 3 are also in the same class of ore, evidently the same vein or body.

DIAMOND.—This mine adjoins the Justice and Silver Hill, and is one of the most eligible locations in Gold Hill mining district. The claim was located several years ago and an incline sunk 150 feet, nearly all the way in good pay ore. Over 200 tons of ore from it was worked in the Succor mill, yielding an average of over $30 per ton, two-thirds of which was gold, when, owing to some disagreement among the owners, work was stopped. Various efforts have been made from time to time by parties with capital to obtain possession of the claim, but until now all have failed. The present company intend to commence work on the claim at an early day.

CALIFORNIA.—Daily yield, 700 tons, principally from the 1500 and 1600-ft levels. The ore stopes and breasts are yielding a very rich character of ore. At the 1600-ft level especially, the ore is of exceeding richness, the south drift showing decided improvement in that respect. The main shaft is now in good order, and hoisting is going on through the Ophir shaft. The new mill is being started up, and the yield for the present month will be considerably increased over that of last month. The yield for August was but a little short of $2,000,000. Sinking the C. & O. shaft deeper is resumed. Considerable water is met with, giving the pumps lively work to keep it reduced.

ORIGINAL COMSTOCK.—Work was started np during ths past week to properly open out and develop this valuable mining property, which, for intrinsic worth, as indicated by the amount of good pay ore beretofore extracted and milled, should bave a promising future.

GOULD & CURRY.—The joint winze being sunk below the 1600 ft level, at the Savage line, is down 319 feet, bard blasting rock at bottom. The new surface machinery is being placed in position as expeditiously as expedient.

AMAZON & GLASGOW.—The new surface machinery will be placed in position st once, the tonndation being already completed. The boilers are of the largest size, being 16 feet long by 54 inches in diameter. Everything looks well in the mine, and the ore vein at the 400-ft level will be opened and ore extraction for milling will bs commenced as soon as the machinery is ready for it.

SUTRO TUNNEL.—Face of header in hard rock, with considerable increase of water comiug in the last few days, which interferes with blasting and renders advancement mnch slower than it has been. The tunnel having penetrated already far into the precincts of the great, broad Comstock ore belt, the tapping of a water vein at any time is to be expected, and is not an unfavorable circumstance, as indicating proximity to an ore vein or body. The total length of tunnel last evening was 14,285 feet, and rock becoming softer.

NEW YORK.—Under the direction of acting superintendent Sam Owens, work is actively resumed and driving ahead well. Openings for pump tanks are being cnt out at the 250, 450 and 650-ft stations, and the most effective pumps will be placed in position, with a 12-inch main column.

OPHIR.—Daily yield, 300 tons of ore, principally from the 1600-ft level. The various stopes and breasts are looking well and the east ore body developed at that level shows constant improvement.

WEST BELCHER.—The main drift west is now in good ore, and the upraise west above the 300-ft level is yielding well in excellent paying ore, showing improvement both in quantity and quality. The Vivian mill is to be kept steadily running on ore from this, and as soon as practicable another mill will be put to work, there being a large smount of good paying ore in sight.

TROJAN.—Sinking the main shaft is getting along at a very satisfactory rate, with the bottom in very favorable and promising vein matter, showing rich streaks of sulphuret ore which bids fair to concentrate into a bonanza.

CROWN POINT.—The main incline bas reached the 1800-ft level, and the north drift at the 1700-ft level will complete connection with the Belcher air shaft very shortly.

BULLION.—Face of east crosscut at the 1700-ft level in easy working vein matter, and making good progress toward the ore vein.

CHOLLAR-POTOSI.—Daily yield, 80 tons, from the old ore producing sections. Total bullion yield for August, $46,961. Good work is being done sinking the main incline, although the ground is hard and plenty of water to contend with.

NORTH OPHIR.—Exceedingly good work has been done sinking the main shaft, and the 300-ft level was arrived at sooner than was anticipated. A station has been opened at that point, and the ore vein, which is close at hand, is being drifted into and properly investigated.

COSMOPOLITAN.—Face of main tunnel continues in favorable ledge matter, with streaks of good ore, and the stopes from the upraise continue to yield a considerable quantity of good milling ore.

HALE & NORCROSS.—The new and powerful pumping machinery has started up and is now in full and successful operation, getting the water out of the flooded lower levels of the mine. At the present rate of progress mining work will be resumed at the lower level very shortly.

ALPHA.—Working hard at the 2000-ft level to connect the drift south with Imperial drift coming north. Hot, close work. This connection is of the greatest importance in the ventilation and development of the mine.

YELLOW JACKET.—Face of the drift south from bottom of south winze in porphyry and quartz with small streaks of ore.

MINT.—At the 1200-ft level a station is being put in. As soon as this is completed, sinking the shaft deeper will be resumed.

LADY BRYAN.—The new surface machinery is arriving and the foundations for it are being pushed forward to completion.

BALTIC CONSOLIDATED.—Face of main west tunnel in streaks of low grade ore coming in at the face, indicating an ore body not far off.

PROSPECT.—The diamond drill is still being pushed forward from the 400-ft station to prospect the ledge and ascertain the ore and water possibilities.

BEST & BELCHER.—Main south drift pushing steadily ahead, with considerable good looking quartz in the face. West cross-drift continues in low grade ore.

NORTH CON. VIRGINIA.—The new works are being started up, the pumping arrangements being fully completed and all things else in readiness.

EAST JUSTICE.—Steady progress is being made in the development of the mine. An extra force is soon to be put on to work in the mine and the shaft sunk to a depth of 600 feet before drifting is commenced, as at this depth there is a strong likelihood of cutting the body of ore found in the Woodville.

DAYTON.—Owing to the unfortunate and fatal accident of the past week, sinking the shaft has been considerably interrupted, but it is resumed and going ahead as usual. Considerable water is coming in.

SIERRA NEVADA.—The body of hot water tapped by the drift at the 1750-ft level interferes with work at that point, but it is subsiding and work will be resumed there shortly.

HERALD.—Incline down 135 feet and ledge showing splendidly, growing wider and richer as further sunk upon. At the depth of 150 feet drifts both north and south will be opened for ore extraction.

LADY WASHINGTON.—Sinking the main shaft goes steadily forward without interruption, the shaft being in good condition and the machinery operating splendidly.

JULIA.—East drift at the 1800-ft level driving ahead in splendid looking vein matter, with spots and streaks of good ore.

WARD.—Total depth of shaft to-day, 547 feet. Rock getting a little softer and water increasing; manage to handle it very well, however, with hoisting tanks.

SILVER HILL.—The station at the 750-ft level being completed, a pump hoi is now being put in. Sinking the main incline deeper will be resumed directly.

MELBOURNE.—The grading for the new hoisting works is completed and the machinery expected to arrive at any time.

UNION CON.—Face of drift from bottom of winze at the 1400-ft level in good working ground, with encouraging ore symptoms.

ROCK ISLAND.—A large hoisting tank has been put to work assisting the pumps to free the mine of the great overflow of water.

BELCHER.—Daily yield, 150 tons, from the old ore producing sections. The southern portion of the mine looks and holds out the best. The powerful new pumping machinery is being energetically pushed forward to completion.

MEXICAN.—Face of northwest drift at the 1465 ft level in excellent vein matter with streaks and bunches of ore.

CALEDONIA.—The water being all ont of the shaft a station is being cut out at the 1100-ft level, and the north drift is started forward again.

SAVAGE.—The powerful new pumping machinery is started up and doing excellent work at reducing the huge flood of water in the mine.

Continued on Page 193.

Continued from Page 186.

and showing the process of the reduction of orea. A supply of ore sufficient for running the mill for a portion of each day was secured from the Consolidated Virginie, California, Ophir and Belcher mines, and was carefully shipped without change of cars from the minea to the Centennial buildings. The ore ia of the character so well known to all familiar with the Cometock lode—a light gray mixture of quartz, stone and white dust, having no appearance of value to the nninitieted. It ia free milling ore, worked by the Washoe amalgameting process, and of qnite a different character from the refractory ores generally fonnd east of the Comstock lode, which require a preliminery roasting with salt in order to chlorinate the ore, or which must he reduced by the smelting process.

The Machinery on Exhibition

Here consists of a donble-decked hoisting cage and mining cars, a stamp mill with automatic feeder, an amalgamating pan and a retort, all of which are the exact counterparts of those nsed on the Comstock lode.

In the center of the building, and occnpying a space aboot 12 feet square, stends the quartz mill proper. Heevy timbers form the framework, which is about 12 feet high, and in the ceoter of the machine are five "atampa" arranged in a row, side by side. Theae are made of bars of iron, about three inchea in diameter and 14 feet long; the lower ends of each ber are shod with cest steel and are much larger than the body of the bar. Aboot one-fonrth of the way from the top of the machioe a shafting extende acrosa to the row of stamps. On this shafting are five long cams, which work sgainst the tappete on the stamp-stems, raising them about a foot, and allowing them to drop suddenly by their own weight. Aa the stsmps fall in regular snccession they drop into a "mortar" of cast iron, faced with steel in its inner surface. Thia mortar is a aolid casting, weighing 4,400 poonds, while the atamps weigh 775 pounds each. The amalgamator is of wrought iron, circular, about six feet in diameter and four feet deep. A muller making 90 revolutiona e minute is affixed to the strong flat bottom of the pan. The seperator ia similar to the amalgamator iu size and construction. It is provided with a pair of arms or deshers which revolve through iia contents, while an opening in the bottom furnishes escape for the amalgam of mercury, ailver and gold.

The interested spectator having taken in all these poiuts is uow ready to view

The Operation of Reducing the Ore.

An iron hopper, known as the Tnlloch antomatic ore feeder, receivea the ore and passes it into the mill at the proper rate of speed through a chute kept in such constant motion as ie necessary for the proper feeding of the mill. As the ore drope into the mill it ia grouod into fine powderby the descending atampa. At the same time with the ore, a stream of water is admitted into the morter and mixes with the powdered ore. We now have what appeara to he a stream of muddy water, and the splashing cansed by the descending stamps forces this water throngh a very fine screen, wheuce it rnns into the settling tanks, where the powdered ore sinks to the bottom, and the murky water is partly pumped off. The crnshed and washed ore is now pessed ioto the amalgemator, where it is heated by steam. Certain chemicals are added, the muller ie set in motion and the heated mesa ia thoroughly ground for ihree hours. A quantity of pnre mercury is now added. The proportioo of mercury used variea according to the richness of the ore, but must alwaya be sufficient to preserve the mass in a fluid state until the end of the process. The grinding process is then continued one hour louger, after which the mnddy mixture is allowed to run into the separator The matter is again kept in violent agitatiou here by the rapid movements of the arms or dashers; and in e short time the perticles of amalgam, looking like mercory, fall to the bottom by their own weight, and pass off throngh au inverted siphon pipe into an iron bowl. This pipe, of course, prevents the escepe of the sand and water by ita being constantly filled with the heavier substance. The amalgam of gold, silver and mercnry in a fluid state thns obtained, closely resemblea pore quicksilver. It is now atrained through a thick canvaas bag, which allows the free mercury to filter into a vessel placed heneath, and leaves in the bag a mass of the consistency of stiff putty. Though still containing about four fifths of its weight in mercury, this maas is now ready to be handled. It is, therefore, placed in dishes in an iron retort and pot into the furnace, where the mercury ia driven out hy evaporation, and is collected by condensatiou to be used again in a similar process. The eveporation accomplished, we have the "retort bullion" ready for the mint. By a chemical process the gold is there separated from the silver, and the two metals are produced in a state of absolote purity. The entire machinery ia driven hy a small Baxter steam engioe, and the operation is daily witnessed by a crowd of interested spectators who eagerly buy the medals whioh are are struck iron the silver made at this Ceotennial mill.

The Chitean Process.

In remarkable contrast with the treatment of ores just described, is that io use in Chile for the treatment of the immenae depoaite of rich ores abounding in our sister repnblic, and whioh is exhibited in a frame building erected for the pnrpose, west of machinery hall. The system is illustrated by means of a fac-simile of the amalgamating machine in nse at Antofagesta. It is one-sixth of the size of the original, and was erected at a cost of $13,000, while the original at Autofegeata cost $230,000. Though no ores are exhibited in aotoal course of treatment, yet the mechinery is sufficiently interesting to develop the essential difference of treatment as compared with that in use on the Comstock lode.

The Amalgamating Machinery

Is in three sections. The first reduoes and washes the ore; the aecond ia used for amalgamating; and the third aection includes the condensing retorts and smelting fnrnace. In the first section, in place of the "stampa," we find two vertical iron rollers resting on an iron plete, and turning in an iron cnp into which the ore is automatically fed. Water is constently supplied and carries the crnshed ore into open flat tanks below, where the ore ia allowed to settle. The water is then drawo off and the ore is carried to the drying pans. The amalgamating aection is somewhat complicated in its action, and oousists of 12 large and two amall casks revolving horizontally, four upright tanks for mixing the chemicel solntion, a washer and a centrifugal machine. The crushed ore is placed in the large caska and saturated with cold water. The chemicel solution ia made in the tanks with boiling selt water, and this having been passed into the caaks, these are rapidly revolved ao as to transform the silver ore from a snlphate into a chloride. Then quicksilver is added and the entire mass is snbjected to the action of the amelgam.

The contents of the caske are now passed into a washer and freed from any impnrities, acids or other chemicals that may remain, leaving pure silver and qoicksilver.

The Centrifugal Machine

Is now bronght into action and, as thoroughly as thia cao be done by mechanical action, the quicksilver is separated from the silver. If the silver still shows impuritiea it is again returned to the amaller caaks, which amply accommodate the diminished bulk, and is there again washed with boiling salt water, Having thue been thoroughly purified, it is stamped into molda and thus prepered for the third section, comprising the quicksilver condenser and the smelting fnrnece.

The Condenser

Is a cylinder or retort closed at the npper part but open at the lower end. An iron plate supports the retort, two-thirds of which are above the plate. The nppe: part is surronnded by a fire-brick fornece, and below the plate are mechanical appliances, derricks, etc., for cerrying the silver and raiaing it into the retorts. The molds, into which the silver had been stamped when leaving the centrifugal machine, are in two parts, forming an iron oylinder held together by iron pins. These molds are placed on iron staods reeting in water buckets, and these, in tnrn, are supported on railway cara. The molds are removed from about the silver, the cars are run under the part of the retort projecting below the iron plate, and, by anitable meane, the silver bar or column is raised into the retort. The water buckets being likewiae raised, close the retort, whioh nnw stands five or six inches in water. Fire is now applied, and after the silver has been sufficiently heated, should there still remain any portiou of quicksilver not removod by the meohanical action of the centrifugal machine, this remeining portion evaporates and is condensed when brought into contact with the water, and appeera as metallic quicksilver at the bottom of the water bucket. The pure colnmn of silver ia then teken from the retort and oonveyed to the smelting furnace, where it is molded into bricks and bara, and is ready for the mint.

This description may serve to call the attention of your readera to the chief features and

Differences of the Two Systems

Of reduction. Which may be the better system, it is, of conrae delicate and difficult to decide. Either system fiods ita warm defenders and equally warm opponente. Whilet the experience gained in the important works of the Comstock ceuses ns to look with pride on the great improvements made in our mining machinery, it is equally certsin that results no less important and gratifying are claimed by our neighbors for the system in nse hy them. It is claimed that the mechine at Antofagasta, the model of which is here exhibited, reduces the ore so systematically, that the loss does uot exoeed *two* onnces of silver in three tons of ore, whether the ore be rich or poor. If this be so, and if the other excellencies exist which are ao earnestly claimed for the Chilean system and machinery, it is easy to nnderstand the conclusiou arrived at by a scientific gentleman from Valparaiso, largely interested in mining property there, whom your correspondeot met last winter in yonr city, and who, after a visit to Virginia City and a careful inapection of the machinery there in use, determined that for suoh ores, at least, as they were theu treatiog, the machinery then in use by his companies was far preferable to that of the Comatock. Io the meantime the exhibition of the different syetems here serves to atteoh a large daily attendence of interested spectators. Notwithstanding the heat, the attendance at the exhibition contiooes very large, and it is confidently expected that the new regulation of admitting visitors at 25 cents each oo the two last Satnrdaya of each month, will have the effect of enormously increasing the nnmber of visitors on those days.

T.

A Query from "Base Metal."

EDITORS PRESS:—Won't you tell us by all that is wonderful what has become of the "Fryer process?" It arose before the delighted visions of the poor fellows whose hopes rest npon the base metal ranges like the mythical El Dorado of Cortez and Pizarro, presaging an age of silver before which the wildest dreams of Senator Jones became every-day affairs and the lamp of Aladdin turned into a tallow dip. But alas! its glory has departed, and left us as the fair bnt false mirage leeves the thirsty traveler on the great Sahare, and no man illnminates the thick clouds of our ignorance with the smelleat reference aa to its sucoess or failure. Shall we also count this with the thonsend failnres that have preceded it, and must we still wait for the glad tidings of a perfect process yet to come? BASE METAL.

Virginia, Nev., Sept. 6th.

[And echo answers, "yet to come!"—ENS. PRESS.]

The Selby Smelting and Lead Company.

The manufacture of articles from lead has grown to very large proportiona on this coast, although there is only one establishment engaged in it. The rapid development of the base metal mines west of the Rocky Monntains and the immense productiou of lead admita of our exporting lerge qnantities of thet metal; and we are also able to supply the Pacific Statea and Territories with all the mannfactured artioles as well. Mannfactured lead has been shipped from here to the Pacifio islends and Australia. Since the eetablishment in this oity of the Selby lead works all imports of this artiole have ceased, so that now our home markets are supplied with the home product and manufacturea.

Thia is as it should be, and we only wish that as mnch could be said of other departments of trade which, with the same perseverance shown, could now staud in the same position. The Selby lead works were started in Auguat, 1865, and have continned in snccessful operation ever since. On the death of Mr. Selby a company was organized to carry on the works, nnder the name of the Selby smelting and lead Co. The principal owners are J. C. Flood, W. S. O'Brien, A. J. Ralston, N. K. Maaten, and Prentiss Selby. Mr. Ralston is president, and Mr. Selby general anperintendent. The company own the large smelting and refining works at North Beach, and the shot tower and manufactory on the corner of Howard and First streets. Of the latter Mr. John Layug ia snperintendent, as he has been ever since the works were started.

The exhibit made by this company at the Mechanics' fair is au index of the articles manufactnred by them. Shot, lead pipe, sheet and bar lead, eto., are made in all the different varieties. All sizes of lead pipe are made, from one-eighth to six inchea in internal diameter, and of all thicknessea. It is safe to say that there are from ninety to one hundred sizes of lead pipe menufactured. Shot of every size is made and has driven all the imported shot out of the market. They also make buck shot, bulleja, etc. The shot tower at the works is 225 feet high from the foundations to the bell on top.

The company also manufecture block tin pipe for dwellings, etc. The block tin is more expensive than the lead by weight, but it is not necessary to have it so heavy for proportionate strength. The block tin pipe is preferable to tin-lined lead. It is difficult to get an even coating of tin over the interior of lead pipe so thst the lead will not come through in placee, and the tin lining makes it no stronger. Moreover half the weight of block tin is stronger than twice the weight of lead pipe. The tin nsed is all Australian. Although these Australian tin minea were only discovered a few years ago it is taking the place of all other tio. The tin in England is almost mined out. Before the disoovery of these miues in Australia block tin was very high but now it is qnite cheap. The block tio pipe is mede at the mannfactory of the Selby smelting and lead oompeny. They also meke solder of all kiuds, and in fact all the articles made of lead which can be enumerated.

At the smelting worke at North Beech they tske the crude bullion, separate the precious metals and refine them for the market. The surplus pig lead, not nsed here, is shipped away in large quaotities. The worke are quite extensive end are kept running continually The crude bullion comes mainly from California, Nevada, and Utah, and is prepared for the market at these works. Aa before stated, these works and the manofactory are a good instance of the success attendant on preparing and mannfecturing a hnme prodnct, their articlea of mannfacture having driven imported articles ont of the merket, while at the same time a valoable raw material, prodnced at home, is ntilized.

An advertisement is the next thing to immediate cash returns in your business. It is the means of storing up future profits in the only way it can be done. The farmer sows his crop some time before he expects to reap it, bnt the advertiser can expect returns for what he scatters broadcast, almost immediately. The advertisement is a faithful servant who works continually and needs no rest. Night and day it is serving your interests in every direction and aids continually in building up your business.

California Wooden Ware.

Among the notable exhibits of home manufacture at the fair, that of E. K. Howes & Co.] manufacturers of wooden ware, is prominent. This firm make a handsome display of all sorts of wooden ware, every piece of which is California manufacture. They make every kind of wooden ware that is used for bonsebold, farm or dairy purposes, a small variety of which only is exhibited. In the manufacture of these articles native woods only are used. They consume annually about 2,000 cords of bolts, comprising cedar from Puget sound and Truckee, sugar pine from the coast, and redwood, spruce, cottonwood, alder, maple, ash and fir.

We paid a visit to the factory this week, on the corner of Main and Mission streets, and were much interested in the process of manufacture of the various articles. Almost everything is done by machinery in some simple way. The factory and grounds cover over a fifty-vara lot, the building being three stories high. An engine of 150 horse-power furnishes the power to all the machinery. There are five brick drying kilns heated by steam and furnaces, in which the wood used is seasoned before being made up, There are 40 men employed in the factory, and about sixty or seventy thousand dollars invested in it. A view of the factory accompanies this article.

The business of the firm extends all over the Pacific coast, to Mexico, South America, Sandwich Islands, China, Japan and Australia. At the exhibition in the latter place in 1875, they obtained the bronze medal of the society, for superior workmanship in wooden ware. They have also had five other gold and silver medals awarded by the Mechanics' Institute and State fair, over all other competitors. There is one other manufactory of like character here, and one in Sacramento, but E. K. Howes & Co. state that they manufacture more than the other two together, having the most complete establishment this side of the Rocky mountains.

The factory is complete in its organization, having fire-walls, brick engine rooms, steam and water pipes throughout. They keep 400 feet of hose attached at all times, and a watchman is on duty day and night. Among the large articles manufactured by this firm is the Eureka refrigerator and water cooler combined, (which we recently illustrated and described). This has had such a sale that four men are kept constantly employed in their manufacture by machinery, the demand increasing all the time. The celebrated Eureka matches are also manufactured by E. K. Howes & Co. at their factory. At the salesroom and store, 118, 120 and 122 Front street, a very large assortment of everything in their line is kept. Buckets, tubs, churns of all sizes, and things of a similar character in endless variety may be seen. Twine nets and seines, fishing tackle, brushes, etc., are also on hand. It is also the agency of the Pacific cordage company.

Without going into detail of the process of manufacture of the various articles, which our space does not permit, it would be very interesting for any one who has not seen it to make a visit to the factory. Even the simple operation of making an ordinary water bucket by machinery is interesting. The modes operandi of the different branches of manufacture will be shown to any one who will call upon Mr. Howes, who will take great pleasure in showing them the model wooden ware manufactory of the Pacific coast.

The Menai Suspension Bridge.

The most stupendous undertaking in which Telford was engaged, and perhaps the most imperishable monument of engineering fame, is the Menai suspension bridge over the Menai strait, one of the most magnificent works in the world. It was full time that some such means of crossing the strait were constructed, as between the years 1661 and 1842, no less than 180 persons had been drowned at the ferry of Moel-y-don. So early as 1810 more than one design for a bridge had been designed, and rejected as impracticable; and it was not until the completion of the great Holyhead road by Telford that he saw the absolute necessity of devising some safe means of crossing. He selected a spot called Ynys-y-moch, where the rock and rocky shores on each side gave opportunities for a lofty roadway, which was carried 100 feet above high water mark, so as to allow vessels of the largest size to pass underneath. It is difficult for the eye to estimate the colossal proportions of this wonderful bridge in the air, and it is only after attentively observing vehicles and human figures crossing it, and looking in the distance through the high trellis work of iron like flies in the web of a spider or sparrows fluttering in a net, that it is fully appreciated. A sensible vibration is produced by the passage of a vehicle, or even a man and horse; but it has withstood the greatest storms of wind almost without injury. The weight which the chains support is calculated at 489 tons, and that which they are capable of supporting at 2,016 tons, leaving an available power of 1,520 tons to resist any unusual strain. The total cost of its construction was £120,000. The masonry is of hard limestone from Penmaen in Anglesea. *Cassell's Technical Educator for July.*

Useful Information.

How to Keep Flour Sweet.

The *Milling Journal* addressed an inquiry to a leading miller as to the best method of keeping flour sweet. The following is his reply: "If the wheat is perfectly dry when put into a bin or garner, it will keep a long while without heating; it will, however, keep much longer in a bin where a current of fresh air is admitted than where it is perfectly close.

"Second. 'As to the vessel used for flour,' we have had no experience, except with the ordinary flour barrel. The best are made of oak, either white or red, made in the usual way of perfectly seasoned stuff. The moisture from green wood has a very injurious effect on the keeping properties of flour.

"Third. 'Of the building or room used for storing.' We believe from our experience that flour keeps better in a cool, dry, airy room than anywhere else. During the heat of summer, flour should not be stored either in a cellar or garret, but in the central stories of a building, kept open so as to have a free circulation of fresh air among the flour.

"Fourth. 'Of any other special requirements, precautions, or peculiarities, necessary to perfect preservation.' We may observe that it is very important to keep the flour from exposure to hot sun or to wet. If shipped to distant ports, even in the United States, great care should be observed with regard to the vessel and other kinds of cargo; the hold should be dry and well ventilated during the voyage. If stowed with corn or oats that become heated, the flour will also heat and sour. Many other articles have this effect on flour. We have had flour soured on a voyage to Boston by being stowed in contact with some deleterious article.

"This is a very important subject,—one that has claimed our attention for many years, and we regret we cannot give you more valuable information."

The Heat of Fire Rooms.

To the toilers before the glowing furnaces and heated boiler plates of the fire room there seldom comes a breath of air, and seldom a hint that the outside world cares a mite for their comfort. We are pleased to find in the *Industrial Monthly* the following: "As to the heat of the fire rooms, we seldom, if ever, see any steps taken for their ventilation, or for reducing their temperature. The general plan of lagging cylinders and pipes with felt and wood, or covering them and the boilers with non-conducting materials, is familiar to all, but these are only partially effective. Windsails cannot always be used, and are often troublesome and in the way. There are parts which cannot be covered with non-conducting materials. The fronts of boilers, for instance, have generally to be exposed for the purpose of cleaning tubes, etc., and the heat radiates directly into the fire room. But it is quite practicable to have a movable plate iron shield, with an intervening space filled with non-conducting material, placed in front of the boiler, that may be made to slide up and down or sideways, as most convenient, and thus check the radiation of heat against the firemen's faces and bodies, and it is a practicable and so inexpensive plan, available in every case, to have a blower worked by machinery, that shall introduce without intermission a current of cool, fresh air. Add to these extra facilities for firing, short watches, suitable clothing, an unlimited quantity of good oatmeal and water, and the discomforts of engineers and firemen will be greatly diminished.

Pull Cords with Care.—An English medical journal contains the following disagreeable but interesting information: "A man was last week admitted into Croydon general hospital with one of his eyes so damaged by the cork of a ginger-beer bottle which he was opening, that it was found necessary to remove the eyeball. We have also heard of many other injuries produced in this way. But it is not, as a rule, the operator of the bottle who is the victim. People have generally sufficient consideration for themselves to point the dangerous weapon in another direction. Barmaids, especially, are very careful not to incur any damage from fugitive corks, but they are, unfortunately, not equally careful about other people who may be in the line of fire. We think that much more care ought to be exercised in dealing with all explosive agencies, including soda-water bottles. The careless way in which the corks are now pried out in many refreshment rooms, and allowed to go where they list, is very censurable."

Coal Burning.—To determine the amount of coal in pounds which will be burned per square foot per hour with chimneys of good proportions, Professor Thurston's rule is to subtract one from twice the square root of the hight of the chimney. To determine the hight of chimney required to give a certain rate of combustion, add one to the weight to be burned per square foot per hour; divide by two and square the quotient.

Remarkable Artesian Well.—At Prairie du Chien, Wisconsin, an artesian well daily discharges 869,616 gallons of water. The well is only 960 feet deep, but has head enough to raise the water 900 feet above the ground.

Hints for Handling Dynamite.

The *Revue Industrielle* gives the following useful information to those who may be called to handle the explosive dynamite: The dangers of handling dynamite may be comprised under two leading heads. The dynamite, and especially the cartridges, ought to be kept in a warm place, that they may not harden, and it is often necessary to heat the primed cartridges that have been for some time in the trenches. This is done by putting them on a hot stove, and as this operation is often repeated several times, it happens that the fulminate of mercury detonates and causes the explosion of the dynamite. Another cause of accidental detonation arises from the property which fulminate of mercury possesses of crystallizing into long needles in the mixture of alcohol and nitrate of mercury employed in its preparation. These needles, which consist of octahedral crystals, easily break and crack, and the more so the larger they are. To avoid this danger the fulminate of mercury is worked up with water and sulphur, or saltpetre on a marble table. By this operation crystallization is prevented as long as the capsules are kept in a dry place. But when they come into prolonged contact with damp air, the fulminate of mercury gets into needles, which are deposited on the inside surfaces of the cartridges. When they are pinched with pincers, as is customary, the crystals break and crack, to the fatal injury of the workman. It is equally dangerous to keep primed cartridges long. In consequence of the pressure of the capsule the explosive material, which was compact, becomes disintegrated, and presents a much larger surface to the damp air. Hence results a crystallization of the fulminate, which may occasion an explosion when the hole in the mine is charged. The above two kinds of danger may be obviated by the use of oiled paper primers, which contain a long tin capsule with a very fine mixture of chlorate of potass and sulphide of antimony. The explosive material is simply poured into the capsules, to which it does not adhere, and they are protected from shocks. The explosive material itself is a mixture and chemical combination of such a character that the crystallization of one of the elements cannot have serious results, because no one of them is explosive by itself. Such a capsule may be flattened on a stove with a piece of wood without any explosion. When the holes in the mines are charged, the dynamite cartridges are simply fastened on the primers. As in this process the two are in contact for only a very short time, and as on the other other hand explosion cannot then be caused without the electric spark, this method ought to have the preference everywhere.

How to Grain Quickly and Well.—J. J. Callow, of Cleveland, Ohio, is the inventor of a novel method for graining with metallic stencil plates. It is as follows: The graining color is rubbed in as usual on the doors or work intended to be grained, and combed for the lights or champs, but not for the walnut, ash or oak hearts. A small piece of Canton flannel (rough side out), or old cloth, is laid over the teeth of the four-inch finest steel comb: the plate is then laid over the panel or work to be executed (or wiped out) with the left hand, while with the other hand the comb and cloth are drawn or combed over the outside of the plate two or three times, and the work is executed instantly, even by the most inexperienced person having one hour's practice, while one grainer can do the work of six grainers in the same time, with an average better job into the bargain. Over 20 different designs or figures can be produced from a single plate by using a slide movement and wiping out at the same time.

Good Health.

Cures for Neuralgia.—Neuralgia is a painful affection of one or more nerves, occurring in some particular habits, but more generally arising from cold in a carious tooth. The pain attending this disease is at times most excruciating, causing at the moment great irritability of mind and body. It comes on with a sudden and shooting pain, which as suddenly subsides, to come on again with greater force, like so many lancets lacerating the parts by a unanimous consent of inflicting torture of the most intense description in a given space of time. Many remedies have been prescribed for this agonizing complaint, often attended with benefit, and at other times with none at all. The best local remedy is the application of iced water, which alleviates the pain instantaneously, possibly to return again; but who, in suffering thus, would not give their all for a few moments' ease? When the pain is centered in the vicinity of the temple, a gentle emetic, with the application of a small belladonna plaster over the temple, is sure to give relief; or a leech or two will produce a good effect, if applied early in the attack; they seldom fail giving ease, by drawing off the inflamed blood; or the frequent use of the following evaporating lotion succeeds better in many cases, than any other known remedy, and should be applied as often as the cloth becomes warm from the intense heat of the parts: Solution of acetate of ammonia, two ounces; spirits of wine, two ounces; sulphuric ether, two drachms; camphor mixture, two ounces; mix, and keep in a well-stoppered bottle.

Hints for the Care of the Teeth.

We find in an exchange an article on care and treatment of the teeth, from which we draw several points: Persons with decayed teeth should never drink anything too hot or too cold, as either will attack the nerve and bring on toothache. In having decayed teeth stopped, take care that all the decayed parts are previously cleaned out. Observe, also, that the stopping used is not of mercurial preparation.

In cleaning the teeth, never use any gritty substance, as tending to destroy the enamel coating of the teeth.

To prevent the formation of tartar, rub the teeth on going to bed, and also the first thing in the morning. Pay particular attention to the stomach, and when you find the tongue furred take some proper medicine.

Exposure to cold is the most frequent cause of rheumatism in the face and toothache; therefore, avoid, when possible, being out in the damp air.

When you have the toothache, do not be persuaded to try creosote; it gives temporary relief to the carious tooth at the expense of destroying the sound members.

In using fomentations, take care your face is not exposed to a draft of cold air, the parts being more sensitive of outward influence at that time.

When determined on having a troublesome tooth out, consider if it is worth stopping, for, after all, a natural tooth is best. Never have a tooth out during inflammation of the gums; and also take care, after extraction, to keep out the cold air. More abscesses occur from neglect of this than any other cause.

The worst of all bad habits is picking the teeth with a pin, and nothing is so predisposing to toothache. If such a habit must be indulged in, use a quill. And, lastly, he it observed that the future perfection of the teeth depends upon the attention bestowed upon them in youth. Parents cannot be too strongly impressed with the importance of this advice; nor can youth be too frequently reminded of any carelessness or neglect to themselves.

Oxygen and Health.

Andrew Roy, in a recent address on the importance of good air in mines, frames the following forcible paragraph:

Jules Verne, one of the ablest writers of our time, has drawn a picture of a peaceful village whose inhabitants had lived for centuries in harmony and contentment. By a peculiar process Dr. Ox extracted from the air its due proportion of oxygen. The simple villagers who had lived for centuries in peace at once became fretful and quarrelsome; fanciful wrongs which formerly were passed by without concern, assumed large proportions; neighbors who had been life-long friends became enemies, and the whole village came to dagger's points. The quarrel did not end here, but extended to all the surrounding villages, whose people were regarded as enemies, war ensued, and there was no end to the quarrel until the doctor was discovered at his nefarious work and got rid of.

This picture, like Macbeth's dagger, presents itself every year in many mining villages of the United States, and it will not be clutched until the nefarious practice of bad ventilation has been got rid of. Mines in which the atmosphere has been deprived of its due proportion of oxygen by the formation of carbonic acid gas will continue to possess a restless and unreasonable population, at dagger's points with their employers and others. Until thorough searching, never ceasing ventilating currents of pure air are made to sweep the places where miners are employed underground, it will be to no purpose to hope to see miners become as reasonable and contented as other citizens of the republic. Fanciful wrongs, magnified one hundred fold, will be used as a pretext to get up strikes as an escape from the foul and poisonous gases of the mine, and lawless acts will accompany strikes, particularly when attempts are made to supplant the strikers with new laborers, as surely as the night follows the day.

The Grinder's Danger.—Dr. J. C. Hall, in a paper read before the British medical association at Sheffield, called attention to the diseases arising from certain trades in the town, with special reference to inhaled irritants. There are three kinds of grinders at Sheffield, wet, dry, and mixed, and it appears that the most fatal kind of work is razor, scissor and fork grinding. Particles of grit are frequently discovered in the lungs of those who had died of grinder's disease, but the speaker had never, even after the most careful microscopical examination, detected a particle of steel. The appearance of a dry grinder's lungs and bronchial glands was illustrated by diagrams. The report stated that no less than 111 of this class of grinders died in Sheffield last year. Dr. Hall considers, however, that a properly constructed fan in a well ventilated room will render the dust perfectly innocuous, by causing it to be driven off as fast as formed, and carried up a shaft to the outside of the building. Boys under 10 years of age are now, by legislation, prevented from working at the grinding mills. Papers of analogous kind were read at the same meeting by Dr. Purdon, on the injurious effects produced on the lungs by flax and dust; by Dr. Beveridge, on the occurrence of phthisis in granite masons; by Dr. Elam, on the presence and tolerance of foreign matters in the lungs; and by Dr. Arlidge, on potters' diseases from inhalation.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parte of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:

Saturday Morning, Sept. 16, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—What Makes the Best Belt; An Improved Provision Safe; California Powder; Nevada State Fair, 185. Foundry Notes; Titles of Patents; Wilcox Pump; Facts About Peat, 192. Jumping Seeds; Sinclair's Safety Attachment, 193. Mechanical Ore Concentration and Separation;—No. 6; Notices of Recent Patents; Gems and Precious Stones, 196.

ILLUSTRATIONS.—McIntyre's Improved Kitchen Safe, 185. Sinclair's Safety Attachment—Open and Closed; Jumping Seeds, 193.

CORRESPONDENCE.—Mines of Humboldt and Lander Counties, Nevada; Alpine County—Its Mines and Resources, Past, Present and Future; Metallurgical Processes at the Centennial; A Query from "Base Metal," 186-190. Mining and Engineering Works in the Mountains; Leaching Processes, 193.

MECHANICAL PROGRESS.—Hints for Steam Users; Condensed History of Steam; Russian Mechanical Education; Steel for Ships of War; American Engines in Holland, 187.

SCIENTIFIC PROGRESS.—Men of Science at the Centennial; New Rays of Calcium; Professor of the Natural Sciences; Zoological Gardens for New York; Prof. Huxley's Views of America; Metallic Osmium, 187.

MINING SUMMARY from various counties in California, Nevada, Utah and Idaho, 189, 190, 196.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 188.

USEFUL INFORMATION.—How to Keep Flour Sweet; Pull Corks with Care; The Heat of Fire Rooms; Coal Burning; Remarkable Artesian Well; Hints for Handling Dynamite; How to Grain Quickly and Well, 191.

GOOD HEALTH.—Hints for the Care of the Teeth; Oxygen and Health; Cures for Neuralgia; The Grinder's Danger, 191.

NEW ADVERTISEMENTS.

White's Revolving Cylinder Furnace, Geo. W. White; S. F.; Hooker's Steam Pump, W. T. Garratt, S. F., Northerly Five Cent Hill M. Co.—Sale; Mariposa L. and M. Co.—Assessment.

BULLION SHIPMENTS. — Bullion shipments have been made since our last report from the following mines: Ophir, Sept. 6th, $18,663; Tybo, Aug. 31st, two shipments, $9,231.70; Tybo Con., $4,692.95; Comanche, 5th, $7,691.70; Northern Belle, $10,100.06; Con. Virginia, Sept. 9th, 70,202.04; California, Sept. 9th, $176,530.43; Northern Belle, Sept. 7th, $8,392.24; Virtue, Sept. 9th, $4,000; Ophir, Sept. 9th, $19,783 40; Tybo Con., Sept. 6th, $4,665.50, Sept. 7th, $4,503.77.

CAESIAR.—The returning miners bring very little news from Caesiar. The claims reported by last advices as paying well still continue taking the metal out in good quantities. Sylveeter, who owned in one of the best claims, is reported to have sold his interest for $5,000 and turned fur trader. No new diggings are reported, but new newe was weekly expected from prospecting parties out in various directions. A number of men are prospecting on the Tecoo river, where the Indians say there are large deposits of gold.

SUBSCRIPTIONS are being taken up in Philadelphia for the relief of yellow fever sufferers in Savannah. At a meeting on Monday night $1,000 was subscribed.

THE proposed trip to the United States on board one of the ships of the White Star line by a group of members of Parliament has been abandoned.

THE President has proclaimed the Hawaiian treaty to be in full force, so island products now enter our harbor free of duty.

A DELEGATION of workingmen arrived in New York from Germany on Sunday, and proceeded to Philadelphia.

Foundry Notes.

As a general thing there is very little doing at the foundries and machine shops compared with the activity of the past summer. The bulk of the season's work is done, and although they all seem to be busy enough, few have any large contracts on hand. At

The Fulton Foundry,

(Hinckley & Co.) they are at work on considerable mining machinery, and have on hand several orders from Mexico. They are building a 12x24 cut-off engine for the planing mills of Powers & Ough. This is of the same pattern as the one which furnishes the motive power to the machinery at the Mechanics' fair, that also having been made at these works. One of the same size as that for Powers & Ough is being made for a quartz mill in Arizona. They are making, to go with this, amalgamating machinery, pulleys, etc. Another engine of the same size and style is being manufactured to be shipped to Mexico.

They are also constructing a set of hoisting works, six feet gear, and double reels for flat wire rope, to go to a mine in Nevada. They have in course of construction an ordinary seven-inch plunger mining pump, five-foot stroke, for the New Almaden quicksilver mine.

A Brodie's patent crusher is being built to go to Mexico with the engine above referred to. A set of Cornish rollers is being supplied to the Great Eastern quicksilver mine. After the ore is put through a crusher it is passed through these rolls. The foundry is also making castings for the Manhattan silver mining company, and has a number of other small orders on hand.

The Aetna Iron Works

Are making several of the White revolving furnaces for different mines, in addition to the other work in the shops. White's patent revolving cylinder furnace for roasting ores was patented first in 1864, and subsequently in 1865, covering any arrangement of an incline cylinder furnace. It consists of an iron cylinder mounted upon bearing drums or wheels at a suitable inclination, with a fireplace at either the upper or lower end of the cylinder as desired. The cylinder is revolved by suitable power, and the ore is fed into the upper end of the cylinder continuously, and passes through its entire length. During its passage the ore is raised by projections on the inside of the cylinder and allowed to drop through the passing heat, thus completely roasting it. The operation is continuous and requires but comparatively little skill and attention in working. It is simply constructed in sections, easily transported, and can be moved and reset at moderate cost. After thorough trial it is found to reduce a large variety of ores economically, and is now superseding furnaces of perhaps greater, but briefer notoriety. The Aetna iron works have made arrangements with the patentees by which they have the sole right to manufacture these furnaces.

Titles of Patents.

EDITORS PRESS:—In your issue of September 9th, my name is published in your weekly list of United States Patents as having received a patent for "meal bins." I never applied for any such article, but I have been successful in obtaining a patent for an article called a "pastry bureau," and if my patent is mentioned in the PRESS, I must respectfully request that the proper name be given. If there is any advantage to inventors in having their patents published, it is all destroyed in having their articles misquoted. JACOB R. FELTER.

San Bernardino, California.

A published answer to the complaint of our correspondent may be the means of affording some information to others on the subject of the titles of patents. The title which our paper gave the invention referred to is the one given it by the United States Patent Office. In the application papers it was styled "pastry bureau," but the Patent Office reserves the right to give their own title to inventions so as to classify titles and make the index of patents uniform. They, therefore, and not us, called Mr. Felter's invention a "meal bin," and they have issued his patent for a meal bin. They do not recognize such an article or class of articles as pastry bureaus. Mr. Felter can call it what he pleases, but the Patent Office classifies it with meal bins, and calls it by that name in order to bring it in its proper class, and no amount of coaxing or arguing will alter matters. If a man should send on a model of a wagon, accompanied by a description of a wagon, and should call it a "dirt cart," the Patent Office would change the title so that it would be indexed with other articles of its class. This is an arbitrary rule of the office. It does not affect Mr. Felter's right to call it a "pastry bureau." He might secure a trademark patent on the words "pastry bureau," and thus prevent any one else from using the name for any other bin. It there were in the Patent Office such a class of articles as "pastry bureaus" then they would have named the invention a "pastry bureau." The description and illustration of the invention in question remain unchanged, so the inventor loses nothing by the change of name. We merely conformed to the title given it by the Patent Office.

The Wilcox Pumps.

Among the notable articles on exhibition at the Mechanics' fair is a fine display of steam pumps from the shop of W. C. Wilcox & Co., 114 and 116 Beale street. In the short space of one year that has elapsed since the gold medal of the Mechanics' Institute was awarded to this pump over all competitors, after one of the most thoroughly contested working trials, it has obtained a reputation that usually can only be had by long years of hard labor and experience. Without going into details of construction or operation, suffice it to say it is a direct-acting steam pump made on the simplest mechanical principles, easily understood and not likely to get out of order.

The pumps on exhibition were not constructed especially for show, but were selected from the common stock of the shop; just such as are turned out every day for the trade. They range in capacity from 1,000 to 40,000 gallons per hour.

One very important feature of the exhibit of Messrs. Wilcox & Co. is liable to be passed by unnoticed by the casual observer. We refer to the upright, deep-well, direct-acting steam pump, which works by an engine standing perpendicularly over an artesian bore or mining shaft, and working the pump, which is attached to the column pipe, and lowered down the well or mine to any required depth.

This last mentioned pump is an invention of Mr. Wilcox, made this year, involving entirely new principles, upon which application for letters patent has been filed. A number of these pumps are now in use in this city, and can be seen by any one interested, by calling at the basement of the Hammam bath-house, the Grand hotel or Palace hotel, where they have been running for several months, and more than meeting the most sanguine expectations of the inventor.

Mr. Wilcox has lately made another new application of the power of steam pumps, which is a great success. A finely finished Wilcox pump is placed in the engine room of the Grand hotel, and forces water into a large tank made of boiler iron, under a pressure of 70 pounds to the square inch. The water is taken from this tank, which serves for both air and water chambers, through several hundred feet of pipe to the cylinders of one of Hinkle's elevators in the hotel. It thus runs the elevator with entire satisfaction and in a very economical manner. This system is now being applied in other cases as the best method to economize the use of water for elevators.

Mr. Wilcox has a number of inventions in the pump line, all of which he has applied in practical work. The deep well pump to which we have referred is a most excellent one, and which will come into great general use. The steam pump that bears his name, after one of the most thorough working trials in a contest against what had been previously considered the best pumps in the world, came off victorious; and the Mechanics' Institute, under whose auspices the competitive trial was held, awarded him the gold medal at their fair in 1875, for the best steam pump. The firm have a fine large shop, now engaged almost entirely in the manufacture of pumps. They have a good outfit of first-class tools, and are kept busy with their special work. During a visit to the works this week we examined a new valve invented by Mr. Wilcox, for use on his deep well pumps, which is the simplest and most effective thing of the kind in use. In fact, all the different kinds of pumps invented and manufactured by him are successful and show great progress in that department.

SILVER BULLION PURCHASE.—The following order regarding the purchase of silver bullion for coinage was issued from the Treasury department on the 11th inst.: Until further notice silver bullion, in form of fine or imparted bars, foreign coin, etc., will be purchased at the mints of Philadelphia, San Francisco and Carson, and the assay office at New York. The purchasing rate will be 101 cents per standard ounce at Philadelphia, San Francisco, and New York, and 100⅛ cents at Carson, payable in United States gold coin, on the determination of value by a mint assay, the seller paying mint charges for melting, refining, and parting, conformably to law and regulations.

THE following is from the Nevada *Transcript*: It was pretty generally said about town yesterday, that the whole property of the South Yuba canal company has been sold to the capitalist, Alvinza Hayward, of San Francisco. Mr. Hayward is largely interested in mining ground in Little York and adjoining townships in Placer county, and it is thought that the purchase of the South Yuba is for the purpose of obtaining more water to open and work them.

DISPATCHES from New York state that on the 11th inst. the work of charging with explosives the columns that uphold the roof of Hell Gate began.

THE troops in the Indian country are hunting winter quarters instead of the Sioux.

HENRY A. WISE died at Richmond, Virginia, on the 12th inst.

Facts About Peat.

[Written for the PRESS by SAMUEL PURNELL.—No. 5.]

Peat for Locomotives.

About six years ago, on the locomotive *C. L. Pond*, a coal burner running between Hartford and Springfield on passenger express, these results were obtained: 6.95 pounds of water were evaporated by one pound of air-dried peat; average pressure of steam 105 pounds. On another occasion, 7.75 pounds were evaporated by the same amount of fuel. A less exhaust or draft was required than when using coal.

Some five or six years ago, on the Grand Trunk railway of Canada, a number of experiments were made with peat, the result of which was that it was regularly introduced on the line and used for seven years. At the beginning of the year 1875, however, coal from the Nova Scotia mines had become comparatively cheap, and the use of peat was discontinued. They are now using wood and coal—Nova Scotia and Anthracite. During early experiments the results were as follows: Engine, five-feet drivers, 16x26 cylinders, drawing 12 loaded cars; distance run per ton of peat (2 240 pounds), 40 33 miles; fuel used per mile, 55.54 pounds; pressure of steam, 100 to 140 pounds. At another trial with imperfectly dried peat, containing 25 per cent. of water: Engine, six-feet wheels, 15x21 cylinders, train of nine heavily loaded passenger cars; distance run, 101 miles; fuel need, 8,000 pounds; fuel used per mile, 79 pounds; average speed, including stops, 23 miles per hour; average pressure of steam, 123 pounds. At another trial, the peat costing $3.50 per ton (2,240 pounds): Six passenger cars; 177 miles run; consumption of fuel, 7,936 pounds, or 45 pounds per mile; speed, 25¼ miles per hour. The cost of fuel per mile run was seven cents. On the Three Rivers branch of the Grand Trunk it was reported that the average distance run per ton of peat was 50 37 miles, or 44 pounds of fuel per mile. An experiment on the main line with a train of 18 cars, on an upgrade, gave a cost per train mile of 10 cents.

From official figures recently furnished by the Grand Trunk railway company, the following is condensed: From June, 1873, to December, 1874, the average cost of peat per train mile was $17.54; average pounds per train mile, 87.70. A comparison between the coal, wood and peat used during portions of two years may be tabulated as follows:

Fuel.	Price.	Lbs.	Engine miles.	Lbs of Fuel consmd.	Lbs per Engine Mile.	Cost in Cts per Mile
Wood....	$4.56	3712	3,190,562	236,963,712	95.08	11.45
Coal.....	6.40	2000	2,324,951	135,240,800	47.80	15.30
Peat.....	4.00	2000	131,670	15,570,850	118.26	23.60

The reader will not fail to be struck with the varying results of these several statements. There seems to be no process of entirely reconciling them. The comparisons between peat and wood were made in the same locomotives—wood burners—without change of grates, etc. There can be no question that to secure the best results of any fuel, the grates, fire-boxes, draft, etc., of a locomotive should be especially adapted to it. It is not a fair test to burn a strange fuel in a locomotive adapted to an altogether different kind of fuel. For instance, although the coast coals and those of the Rocky mountain region are almost identically the same, yet on the Central Pacific railroad locomotives it is found best to burn them with different styles of grates; and for wood still another style of grate is used. The above table also shows a very small use of peat as compared with either wood or coal; certainly not enough was consumed to allow of a fair comparison being made. It is also reported that the engine men were displeased with peat because it clinkered and gave them more labor in shoveling in fuel to keep up steam; they had, therefore, strong inducements to cause the peat to give a low duty and the other fuels a high one.

To show a few facts as to the different coats of fuel for train service, the following figures from official sources are furnished: One pound of Illinois coal will evaporate a little over seven pounds of water. The Rocky mountain and Seattle (coast) coals have been proved to do about the same duty. A test of Mount Diablo coal showed that its evaporative power was about five pounds of water. The average of number of miles run on the Central Pacific railroad with Seattle coal is, per ton, 45.28 miles; with bituminous coal from Pittsburg the average run in the East has been 37 miles per ton. The average cost of fuel per train mile was 7.78 cents on the Atlantic and Great Western railway, and the cost per ton of coal $2.83. On the Louisville and Nashville railroad the cost of coal per ton was $3 50, and the cost of fuel per train mile 10 cents. On the Central Pacific railroad the cost of coal is $8 per ton, and the cost of fuel per train mile 17.65 cents. These latter figures suggest that an increased economy would be desirable. It remains to be seen whether peat will afford this increased economy.

THERE is a very bitter feeling among the Black Hills miners against the peace commissioners, and the other day when they were going from Cheyenne to Fort Laramie they were hooted at by the incoming miners, who told them they hoped the Indians would take their scalps before they got through with their cowardly peace mission.

Mining and Engineering Works in the Mountains.

Culbertson's Station, South Yuba.

Ens. Press:—The acenery in these mountains ia inexpressibly grend, and everything is npon auch an immense scale that all our usnal experience in judging hights and distances seems to fail ns altogether here. The clear, pure atmosphare adds to the difficulty, end one is astonished to find thet they have walked three or four miles to reach a point apparently only half that distauce away.

South Yuba Canal Company's Flume.

Less than one mile ahove Culbertson's station ia the dam which tnrns the water from the river into the great fleme of the celebreted Sonth Yuba osnal compeny, whose water privileges and facilitiea have letely been examined hy a committee oppointed to report upon the different sonrses from which Son Francisco mey obtain her future supply of fresh water.

This flume winds aronnd the side of the mountaina 200 feet ebove, elmost overhead, end lu sight of the window where I em now writing, and 120 feet below it is the flume of the Blue Tent grevel mining oompany, which takes its weter from the river ebont half a mile above here. About one-half a mile below here commences the flnme of the Omega weter and mining company, which rnns in the seme direction with the Blue Tent flume, end is ahout 180 feet below it, so you will see that I em in close proximity with some of the most celebrated miniog and engineeriog works of the Stete.

There ore four

Water Privileges

Upon this stream; first, that of the South Yuba company, which controls Meedow lake, Fordyce Valley lake, White Rock lake and Devil's Peak lake. Their flume is six feet wide and five feet deep, and has a capacity of 7,500 minera' inchea of weter, end when their Fordyce Valley dam is raised, about 20 feet oan furnish thot amount the whole yeer round. To any one who is not familiar with miners' measurement of water, it will be more intelligible to eey that et its full oepacity the flume is full of water running at a velocity of 10 or 12 milea an hour. This flome is very solidly built, and hea been in existence ebout 21 yeers. It will be rel nilt during this year and next. This oompany furnish water for Nevada, You Bet, Dutch Flat and the neighboring aections of oountry.

The Omega Company.

The second privilege is thet of the Omega company, who take the snrplns from the Sonth Yuba and nse it at their claims, abont 12 miles below here. Their flume is four feet wide, and at present will allow 22 iuches depth of water, rnnning ebout 1,200 inches. They have also aome small lakes, which are tapped es the river becomes low, to keep up their supply.

The Bear River Mining Ditch

Has the third privilege, taking what water can be spsred by the Omega oompany. This ditch tak s its weter abont aix miles above here end carriea it about six miles to Bear river, into which it emptiea. It is egain taken out below by ditch end helps to snpply Dntch Flet end Gold Rnn. The capacity of this ditch is about 2,000 inches.

The fourth privilege ia that of the

Blue Tent Gravel Mining Company,

Situated north of Neveda and distant abont 30 miles from here. This flume was completed thia Spring, and ia aix feet wide and four end a helf feet deep, heving, when full, a capacity of abont 4,500 inches.

As the three last mentioned privilegea cen only nse the snrplns water which runa in the river, they can only work a portion of the seaaon (from three to five or aix months), but from the above you will aee that this river ia about as industrious as it can well be.

As Engineering Works

These mining ditches end flumes are most wonderful. Starting at the point where they take their water from the river, they wind aronnd the mountain sides so as to preserve the proper grade, end although they often meke snch abrnpt cnrvea es must greatly decrease their carrying cepacity, yet an exemination will at once show that it could not be avoided, es it would either involve the expense of tunneling through the herd granite of a mountain 2,000 feet or more in hight, or the carrying of the flume across an abyss of 500 to 1,000 feet in depth, with no point from which to obtain a supnort. The mounteins ere very steep, and overheng in auch a precipitons menner, thut as you look np from below the greet flume seems a narrow thread clinging to the side of the rock without any epparent support.

Yesterdey I walked down the flume of the Blue Tent company to a point about three milea below here, known as

Cape Horn,

A name, hy the wey, which seems to be eppropriated for all grend end precipitous points. A nerrow board or two is nailed upon the esp timhera of the flume, giving a foot peth only 12 inchea in width, sometimes rnnning dangerously near the outer edge, and with a sheer deecent of from two to five hundred feet. It tekes a steady nerve and cool head to walk a flume, especially when the wind hlowa. This particular Cape Horn appeers to be bnt little known, as I have met a number of old residents in the neighborhood who have never seen it, but for magnificent grandeur of aceuery it cen hardly be equalled in the State. The femous Cape Horn upon the Central Pacific ia almost insignificant beside it.

At thia point the flume is built along the side of a solid wall of granite with an almost vertical descent of at least seven hundred feet. Down the monntain the workmen crept to the edge of this precipice, end were lowered by ropes to drill holes in the smooth wells which efforded hurdly a crevice as large aa might be found in the wall of a room. Into these holes when drilled were inserted iron eye-bolts, and from these the workmen were suspended by ropes, fifteen hnndred feet ebove the rocky bed of the river below, and so the flume was built.

Looking down from the flume the river is dwarfed to a brook. Pine and spruce trees upon its banks two or three hundred feet in hight appeer like lawn shrubs. Cataracts falling thirty or forty feet appear like the weterfall which a child would meke with e shingle. A rock dropped from the flume strikes et points and bounds downward, growing smeller and smaller until it disappeers from sight, bnt it cen be heard long after. Upon the opposite side of the river the monntein rises in an almost sheer wall two thousand feet in hight. The river runs for some miles between these gigantic walls of rock, with new snrprises at every turn, and all along the finmes are carried with more or less difficulty. S.

Jumping Seeds.

During the past week considerable wonderment hes been creeted by the appearance of small minnte seeds, which keep up a continnal jumping, as if possessed of life and animation. To give them a nsme has befiled all our doctors and scientists, and cnrio-ity hea run wild to know what they ere, and whet mekes them jump. We have thought over the matter end tried to explore the mystery, bnt cen only arrive at the conclnsion that they are persaitea that grow on the oek leaf, end when ripe fall to the ground. The life which is exhibited is, perhaps, derived from a combination of animal and vegeteble matter producing electricity. They ere picked np in varioua perts of the city, on the ground nnder oak trees. Some of them have been corked np in viale for over a week and still they jump.—*Chico Enterprise.*

OYNIPS SALTATORIUS.

These "flea seeds" were brought to notice acme two yeers ago, and were described at length in the Mining and Scientific Press and Pacific Rural Press. It aeems, however, thet they have mede their appearance in Butte county, and are the object of some curiosity, being considered something new. As a matter of general information we give an illustration of the "seed" and the insect, and extract from the report of C. Mason Kinne, of the San Francisco Microscopical Society, who followed their development throngh to the perfect insect. He says:

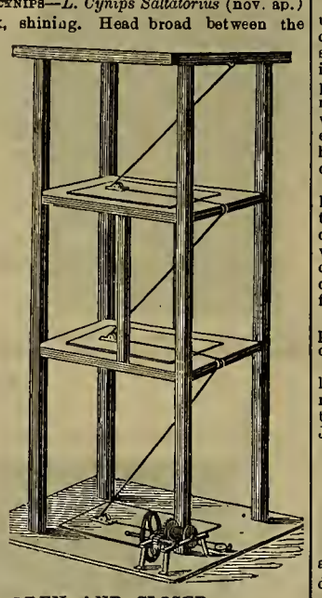
The seeds are very minnte, presenting the appearance of a mnstard seed, and are of a brown color. On placing them in the open hend the "seeds" jump ahont from one place to another in a very lively manner. Even when in a vial or small bottle the same charecteristic is manifest, and aa they were somewhet peculior the "flea seeds" have attracted considerable attention.

The gell or coccon is fonnd lightly etteched to the leaf of the oek, and in time falls to the gronnd, when the noise occasioned by the thousends leaping about, without any apparent cense or organa of motion, sounds very much like the falling of fine rein on the leaves. An exumination shows that the extraordinary activity displeyed is caused by the spaemodic contraction and concussion of the abdominal parts of the occupant against the side of the shell, which movement does not cease even after the covering is nearly split in halves, if the tender structure of the chryaalis be not injured. That it is the chrysalis and not the larvæ hsa been shown by the microscope, end ita change to the perfect insect haa been noted at weekly stages.

The average length of the inaect is five-hnndredths of an inch, and in each has been found from 60 to 80 peer-shaped ove. The engraving gives ita general appearance, with wings raised somewhat nnneturslly, for the purpose of showing their size and shepe. It was drawn on the wood, from the microscope, by Mr. Kinne, and is enlarged 20 diameters. Its ovipositor ia a tiny, though perfect, piece of Nature's mechanism, and lies encased in a sheath at the lower part of the abdomen. Mr. Henry Edwards, of the Microscopical Society, furnished the following technical description of the curiosity:

GENUS CYNIPS—*L. Cynips Saltatorius* (nov. ap.)

Black, shining. Head broad between the eyes, which are very prominent. Antennæ 14-jointed, the first and second joints being much swollen, and the third joint larger than the other two; the remaining joints are long, simple and nearly equal. Thorax densely but finely punctured, very globose in front, projecting so far aa to almost hide the head. Abdomen globose, shining. Ovipositor cases, short, spetulate received into mergined groove in the body. Ovipositor itself flesh color, curved inwerdly towards its middle. The abdomen is six-jointed. Terminal joint of palpi, hatchet-shaped. Tarsi very heiry throughout, the anterior pair with six end the remainder with seven joints. Coxæ very globose. Tibæ long, with lerge end powerful spines at the base.



SINCLAIR'S SAFETY ATTACHMENT—OPEN AND CLOSED.

Hot Shot in Railway Cars.—A Chicago man has an idea which is startling, if not original. He says: "I have a plan to heat cars of all kinds that entirely does away with the chances of burning, in case of accident. I would use no stoves, hot water, or steam, but would use red-hot shot, that weigh 100 pounds each, placed in a box under the car, with regisiters in the floor of the car. Five balls would heat the car for four hours, the furneces for heating to be placed along the stations, 100 miles apart. In case of accident there would be no stove in the car to burn the passengers, as in the recent case of the proprietor of the Sherman house, on the Harlem road. Mr. Holmes of the South Side horse railroad company, has given it a trial, and is pleased with its working."

The reunion of the Californians under the auspices of the Pioneers of the Territorial days of California, was celebrated at the Pacific coast Centennial hall, on the exhibition grounds, on Saturday. About 700 persons were present. General Sutter presided, and speeches were made by General Hooker, Colin M. Boyd and others.

A mortgage of seven million dollars has been placed on the property of the Spring Valley water company.

Leaching Processes.

Editors Press:—Permit me to reply through the Mining and Scientific Press to certain letters of inquiry in regard to the best and most economical leaching process known et the present time, and adepted to all classes of ores, no matter how refreotory, (lead ores excepted.)

Of the leaching processes which I have used two of them are well known to the public, viz.: the Augustin and Patera; of the Hunt & Douglas process very little is known at present.

The Augustin process (in which brine only is used) is applicable to very few classes of ores, hence it cannot be called a profitable process.

The Potera process consists in the use of a hyposulphite of soda or calcium solution. This process is applicable to all classes of ores, (lead ores excepted.) But in attempting to precipitate the silver with sulphide of sodium or calcium solution, all the base metals are precipiteted et the same time, hence we obtain a large bulky precipitate, which, as a general thing, is not richer in silver than the rich silver ores. And to dry, roast, melt and refine this precipitate I would rather smelt and refine the rich silver ores in a crucible, as I do not consider this process profitable or economicel.

The Hunt & Douglas process consists in the use of a solution of salt, chloride of iron and copper, using also, in connection with this, sulphurous acid fumes in regenerating the salt, iron and copper solntion. This process is applicable to all kinds of ores, no matter of what nature and how refreotory they may be, or whether the ores contain large amounts of lime and zinc, even 15 per cent. of lead would not hinder or injure the operation of working the ores.

Of this last process very little is known. I have used it for some time on the most refractory ores known, and find it far superior to any other process. All that is required to start with is in prepering the brine; this becomes charged with iron and copper existing in the ores. The sulphurous acid gas can be made from iron pyrites.

The silver can be precipitated by cement copper, which is also a natural product from the ores, and which is precipitated by iron, etc.

Works can be erected with comperatively little capital, and few hands are required to run it. Any and all information in regard to this last process can be obtained by addressing J. O. Steward, Georgetown, Coloredo.

H. Schafer.

Georgetown, Coloredo.

Sinclair's Safety Attachment.

In view of the fact that many fatal accidents are each year occurring from persons falling down uncovered hoistways, elevator shafts, etc., a need has been felt for some effectual preventive that should not at the same time hamper the operations of commerce. The danger to life alone was not the only thing to be taken into consideration. In cases of fire these open ways communicating from story to story have constituted a convenient pathway for the devouring element, and by the draft they induced accelerated its march and directed its course right along the only way of escape. Firemen have often fallen through them when in the discharge of their duty. The coroners of New York report fifteen inquests for 1875, upon the bodies of those killed by falling through hoistways. And to this number may be added dozens maimed for life. Nor are these accidents confined to New York, as our own city has contributed a similar proportion to the army of the dead and crippled from this cause. Under these circumstances the invention of Mr. Sinclair's simple and economical trap-closing apparatus is a boon to every humane man and a safeguard to his employees. By reference to the illustration, we publish herewith, it will readily be seen that a person may manage all the traps from one floor, opening and shutting them at pleasure, without the necessity of going up or down stairs. They are in use in many of the best buildings in our Eastern cities, and are applied to ventiletor shafts, elevators and stairways, as well as hoistways.

Mr. William G. Fowler, 415 Sansome street, manufactures and applies them, to whom all orders should be addressed. He has already placed them in position in the buildings of Reddington & Co. and Stein, Simpson & Co. corner of Market and Second streets, where they can be seen in operation.

Storing Barley.—A son of an old subscriber of ours, at School House station, San Mateo county, while hunting, last Saturday, shot a squirrel and found 427 barley grains stored away in his chops.

The *Consuelo* won the Ashbury cup in the regatta of the San Francisco yacht club on Admission day. The *Pearl* won the second prize, a silver punch bowl.

CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

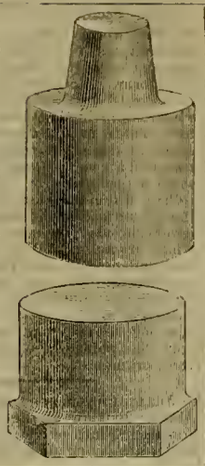
Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

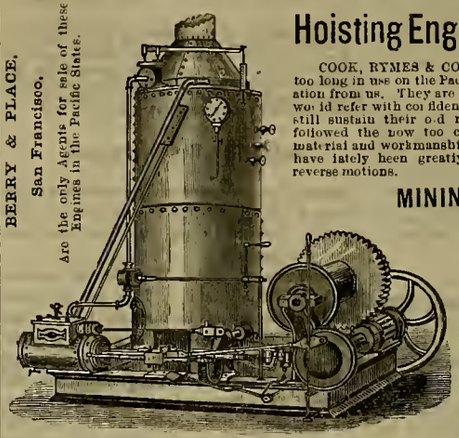
We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,
59 Nevada Block, S. F



BERRY & PLACE,
San Francisco,
Are the only Agents for sale of these Engines in the Pacific States.



Hoisting Engines. Mining Engines.

COOK, RYMES & CO.'S celebrated Hoisting Engines have been too long in use on the Pacific coast to require any special recommendation from us. They are well known from Alaska to Mexico. We would refer with confidence to any one of the hundreds in use. They still sustain their old reputation, the manufacturers not having followed the now too common practice of reducing the quality of material and workmanship to compete with cheaper engines. They have lately been greatly improved by adding large drums, and reverse motions.

MINING HOISTING ENGINES.

(Manufactured by the same parties.)
Our new Mining Engine is built from plans and specifications of several of our MOST SUCCESSFUL MINING ENGINEERS, and the result is the most complete

Double Drum Hoisting Engine

Ever built. Their advantages will be seen at a glance by any one familiar with the necessities of a mine. These engines may be seen in use in Ophir, Con. Virginia, Chollar, Europa, Niagara, Leviathan, Phil Sheridan, and several other mines on the Comstock Lode. For sale only at

BERRY & PLACE,
(Successors to Treadwell & Co.)

THE BUCKMINSTER ROCK DRILL.

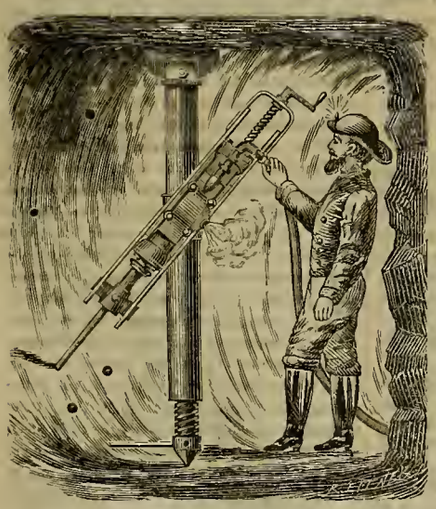
The Most Efficient Rock Drill in the Market.

LIGHT, STRONG and DURABLE.

No External Machinery Liable to Injury from Rough Usage, as all the Working Parts are Enclosed in the Cylinder and Valve Chest.

A TRUE SMOOTH HOLE EVERY TIME. THE MOST ECONOMICAL DRILL YET MADE.

THE WORKING PARTS OF THE DRILL ARE FEW AND SIMPLE IN ARRANGEMENT, SO THERE IS NO LIABILITY OF INJURY. THE CLAMPS FOR HOLDING THE DRILL ON THE TRIPOD, FOR HOLDING THE DRILL TOOL IN POSITION, AND FOR FIXING THE WEIGHTS ON THE LEGS OF TRIPOD, ARE ALL IMPROVED AND VERY EFECTIVE.



This device for rotating this Drill has few parts, and can not get out of order. There is no chance for wear. The motion is positive, and never fails of action. The Drill Carriage can be turned clear round the column, and can also turn in a complete circle on the head of this clamp.

All parts subject to wear are of the Best Cast Steel, and all made to gauge and interchangeable.

This is the Lightest and Strongest Rock Drill yet invented. Being nearly all Cast Steel, it is easily handled and moved, as all superfluous metal is dispensed with.

We also call the attention of those interested to the Horizontal Air Compressor furnished with the Buckminster Drill when desired. It is Economical, Light, Easily Run and conveniently portable.

We claim that the Buckminster Drill will do as good work as any in the market, at a much less expenditure of power, and a great decrease in first cost of machinery. Drills made all the usual sizes.

Mining Companies Desiring Rock Drilling Machinery should Examine this Drill and Air Compressor, and we are confident that it will give satisfaction. Address,

Arizona.

RICH ORE FROM THE KEYSTONE.—Wallapai *Enterprise*, Aug. 25: Some of the richest ore ever taken from this valuable mine was worked at the Mineral Park mill this week. John Corin, who has for some time past been tributing on the lower level, had two tons and a half of second-class ore worked that yielded $240 per ton; and 1,700 pounds of first-class ore "panned out" at the rate of $795 per ton. Thomas Steen and John Penherthy, who have been working under a lease on the first level, had over two tons of ore that went $568 per ton. Two tons of ore out of the winze yielded Messrs Morton, Bracken and Williams $742. Morton and Bracken had two tons worked that paid $425 per ton. W. R. Jones sorted from a pile of third-class Keystone ore 2,700 pounds that pulped $307 per ton.

SMELTING WORKS.—Cor. Arizona *Miner*: The Foster grist mill is being put in first-rate condition, and is capable of grinding three tons of wheat per day and from one to two tons of corn. The water power is excellent and permanent the year round, making it a valuable property. Attached to the mill is the necessary machinery for working the Perkins & Shæffer smelting furnace. They have to date, since February 12th, worked 60 tons of ore from the Peck, Silver Belt and a few other mines, giving a total yield of bullion of over $17 000, or of nearly $300 per ton average. Some important additions and improvements are now being made to the furnace, which, when completed, will add much to its capacity.

Oregon.

TRAIL CREEK MINES.—*Bedrock Democrat*, Sept. 6: Mr. J. B. Gardner, of this city, returned from the Trail Creek diggings last Sunday week. He informed us that he and Mr. W. H. Thompson have purchased the Trail Creek diggings, formerly owned by Harvey Robbins and Ike Nail, for $24,000. They have three years' time in which to pay for them, but will pay sooner if the money is taken out of the claims. Mr. Gardner thinks the above amount can be taken out the first season. We hope they may not be disappointed in their expectations.

[Copyrighted.]

Mechanical Ore Concentration and Separation.—No. 6.

(Written for the PRESS by FRANCIS F. M. CAZIN, M. E., Santa Fe, New Mexico.)

Of What Mineral Dressing Principally Consists.

The exposition in previous articles of the principles by the application of which successful mineral dressing has been carried out, prove that by necessity the action of mineral dressing must be divided into three equally indispensable actions: 1st, the breaking into proper sizes; 2d, the assorting according to size; 3d, the separation or concentration proper.

In the following sections I propose to show for each of the three actions how it should be done efficaciously and profitably. But before doing so I deem proper here to examine where either of these actions should be done.

The breaking begins in the mine or quarry, and it is part of proper management and economy that the material requiring further breaking than the balance should not remain with what has to be subjected to only a further limited amount of breaking. In the mine, when loading the hoisting vessel, as well as on the dump, therefore, the small rock and dirt (usually the richest) should be kept separate, and even be further separated as far as this can be done without extra expense.

The proper handling of the ore for the purpose of hoisting or wheeling it out of the mine should be utilized with the utmost care, for picking out all hand pieces of poor rock should never be lost sight of. Every ton of poor rock thus thrown out is so much saved in transportation and future handling. The ore thereby will become richer and be more easily treated. First-class ore, consisting of rich hand pieces, should be kept out as often and as long as possible. It can then be sooner disposed of and the percentage of loss, small as it may be, but which is always unavoidably connected with mechanical concentration, will be saved on the first-class thus picked out.

If at all practicable, the total action of mineral dressing should be on the mine. In some mineral dressing works which I have in mind, the works are erected over the mine shaft, so that the cages are lifted until under the roof of the high building and there dumped on a turn-table. By this means all further transporting and handling is saved and an opportunity is given to pick the dead rock as well as the first-class ore. All the rest is scraped from the turn-table into the machinery for dressing, so as to pass the different machines by its own gravity, down 81 feet—the hight of the building. Even more profitable than this arrangement is the case where the slope of a hill can be utilized in the immediate vicinity of the shaft or tunnel. In both cases the required machinery for further breaking of the ore should be connected with the dressing works proper.

Where by circumstances it becomes unavoidable necessity to locate the dressing works at some distance from the mine, (as for instance, the utilizing of water power and hill slope, the presence of water for dressing purposes, the requirement of fuel for steam power, etc.,) it may, in special cases, be advisable (where the hoisting power can be thus further utilized), to pursue the breaking to some extent, especially so if a large amount of dead rock can thereby be held out, (picked), and transportation thus be saved. Breaking to a size which will be carried along in gutters or flumes by the water floating from the tunnel or mine pumps will be advisable, where such water can be utilized, as the cheapest medium of transportation from the mine to the dressing works.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING SEPTEMBER 5TH, 1876.

TURN TABLES FOR ENDLESS TRACTION WAYS.—Joseph Britton, S. F.

TREE TRANSPLANTERS.—Timothy Carroll, Anaheim, Cal.

METHODS OF SETTING HAIR-TRIGGERS OF RIFLES, ETC.—George C. Leonard, Red Bluff, Cal.

PROTECTORS FOR CHANDELIERS.—Frank J. Symmes, S. F.

MACHINES FOR COMPACTING LOOSE GRANULAR SUGAR INTO CUBES.—Thirsy L. Wadsworth (executrix of Wadsworth, deceased), Sacramento, Cal.

ORE ROASTING FURNACES.—John Winterburn, Cambria, Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

ORE FURNACE.—John Winterburn, Cambria, San Luis Obispo county. This patent covers certain improvements in furnaces for roasting ores which contain volatile substances of value, such as the ores of mercury. The invention consists in the introduction above the fire arches of a prism-shaped exit pipe, which serves as a combined distributor for the ore and discharge pipe for the vapors, which it leads into the condenser. The invention further consists of a steam pipe which opens into the upper part of the furnace, leading thence into the condenser, and this pipe conducts away the steam arising from the drying of wet ore, so that no especial drying apparatus need to be used previous to its introduction into the furnace. The inventor states that practical use proves that with this device wet ore can be reduced with the same facility and speed that can be accomplished with dry ore in ordinary furnaces, and with dry ore the capacity is nearly doubled. The device is also of great assistence to the condensers, because, instead of allowing all the heat to rush into the condenser, a large part of it passes above the exit pipe, and becomes latent, in converting the ore of the water into steam. This steam may either pass directly to the main condenser or it may be led into separate condensers, so that the steam and vapors may be condensed separately from the mercurial fumes. The device acts as a separator because the steam and other fumes or vapors are carried off above the pipe at a heat of less than four hundred degrees, while the mercury is volatilized at a higher heat below this pipe and is carried to the condenser by itself. It is claimed to take one-fourth the fuel, makes less soot, and also a better product of mercury than other forms of furnace. The mercury is easier to condense than when in the presence of steam, which tends to float and carry off some portion of the mercurial vapors.

DEVICE FOR TRANSPLANTING TREES.—Timothy Carroll, Anaheim. This invention relates to a novel device for transplanting fruit trees, and consists in connecting a vertically moving tube and guide rod or rods with a frame, whereby said tube may be operated for the purpose of taking up the tree; also in a lever pivoted to the frame and a loose ring arranged within the tube whereby the ball of earth around the roots of a tree may be forced out into the hole prepared for its final reception. A hinged piece is at the lower end of the frame, which during the operation of taking up the tree is bolted in line therewith, but which after the tube and tree have been re-set, may be unbolted and swung out of the way in order that the frame may be lowered and the lever brought down to act on the rods of the tube so as to raise the same.

TURN-TABLE FOR ENDLESS TRACTION RAILWAY. Joseph Britton, San Francisco. This invention relates to improvements in turn-tables such as are used for transferring cars from one railway track to another where an endless wire rope is used for propelling the cars along the track or tracks. The only instance we are aware of where duplicate turn-tables have been used for this purpose is on the Clay Street Hill railway in this city. As these tables have been heretofore constructed, the wire rope which gives traction to the cars passes beneath the center of the turn-tables, so that it is necessary not only to release the rope from the gripping apparatus or device which connects it with the car, but it is necessary also to raise the gripper by means of a screw or otherwise, so that it can pass over the turn-table. When thus raised the moving of the car from the track to the turn-table, the turning of the tables, transferring the car from one table to another, and finally moving the car again upon the track from the turn-table, are all accomplished by hand at the expense of time and labor, besides the wear upon the screw or other mechanism by which the gripper is elevated. The invention under consideration contemplates such a construction of the turn-table that the endless wire rope can be passed above the center or bearing point, and thus permit the car to be drawn by the rope to the position upon the table before it is released by the gripper. The arrangement saves time and labor. As the slot in the tables and the spaces beneath them correspond with the tube and slot of the track, these tables can be placed at any point on the length of the track without in any way interfering with the passage of the cars in ordinary travel, and thus provide a means of transferring the cars from one track to another when desired, without sending them to the end of the track to be transferred.

SUGAR COMPACTING MACHINE.—W. Wadsworth (deceased), by T. L. Wadsworth, administrator, Sacramento. The invention of said W. Wadsworth (deceased), combines certain improvements in machines for converting loose granular sugar into blocks or cubes or other solid form. It consists in the employment of a rotating drum or cylinder, the face or rim of which is provided with cavities or cells which form molds, in and upon which the granular sugar is deposited from a hopper which is mounted above the drum and into which the sugar is compacted or condensed by pressure rollers, which are so arranged as to press upon the rim or face of the wheel as it rotates. The invention also includes a system of pistons which are automatically operated so as to force the condensed blocks or cubes out of the molds and deposit them upon an endless belt. The operation is continuous. The wheel deposits the sugar in the trays on the endless belt while the belt moves continuously and carries the trays to a point where they can be removed by the workmen.

ARRANGEMENTS are now being made by the Marine division of the Treasury Department for placing into active operation, and immediately, life-saving stations on the lakes.

THE American team won the International rifle match at Creedmoor.

THE Mechanics' Institute fair closes to-day, Saturday, September 16th.

$1,000 Challenge Ore Feeder.

J. HENDY, ESQ., San Francisco, Cal.—*Sir* On visiting the Mechanics' Institute fair on Thursday P. M. of this week (I had not been there since Saturday last), I found put up on your ore feeder a $1,000 challenge in the form of a handsome little gilt sign. The whole sign is: "$1,000 CHALLENGE ORE FEEDER," as though you might mean simply to give your feeder a *name*. If such was and is your object, the device is a good one, and I do not see how it can fail to draw attention. If, however, you are seeking a trial of your feeder against all others, I will say, on my own part, that I am ready.

Please enlighten me fully as to your objects and oblige,

Yours very respectfully,
C. P. STANFORD, 2401 Buchenan St.

San Francisco, Sept. 9th, 1876.

C. P. STANFORD, ESQ.—*Sir:* In reply to yours (9th inst.) respecting the handsome little gilt sign, as you call it, on my feeder, it means precisely what it has inscribed on it, not as a title to the machine, but a challenge for any and all ore feeders now on exhibition at the Mechanics' fair, now held in San Francisco. The machine, to be subject to trial in every kind of rock or gouge, or whatever may come in contact in the general use of ore feeders.

Further, as regards the gilt sign I will now state, that as for gilt you will find that you are in error, as I have not had any means to spare in decorations since I paid you $2,950 U. S. gold coin for your patent on ore feeders, which you represented as covering the adjustable lever on all ore feeders, and that you claimed to be inventor of the same, but you still continue to use it under the pretence that it is not an adjustable lever, but some other mechanical appliance. Now, sir, I am willing to risk an additional sum of $500 U. S. gold coin against a like amount, and leave the decision to three or five competent judges as to whether you are using that which you sold me, viz., the adjustable lever for ore feeders.

Should they decide that it is not an adjustable lever that you are using on your feeder, I will forfeit $500; should they decide to the contrary, then you will forfeit $500.

Hoping that this will sufficiently enlighten you and bring you to test your machine on its merits at your earliest convenience.

I remain, respectfully etc.,
JOSHUA HENDY.

Francisco, Sept. 11th, 1876.

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

O. Idocrase, Vesuvianite, Xanthite, Cyprine.

Idocrase, named vesuvianite by Dana, is a silicate of lime, alumina and iron, with magnesia, mangeness and potash in small quantities.

The following analysis will give a general idea of its composition, although as the composition of the different varieties differs it is impossible to write any formula which will exactly represent it: Silica, 37.36; lime, 29.68; alumina, 23.53; protoxide of iron, 3 99; magnesia, protoxide of manganese and potash, 5.21;=99.77.

The crystalline form of idocrase is tetregonal. Luster, vitreous. Color, brown, green, blue. Streak, white. Sub-transparent; fracture uneven. Double refraction feeble. Hardness, 6.5. Specific gravity, 3.349–3.45. B. B. fuses with intumescence, yielding a greenish gloss. Gives a strong reaction for iron with reagents. Some varieties react strongly of manganese. Partly decomposed by muriatic acid. If the mineral is first ignited it becomes wholly soluble in muriatic acid.

The purest samples of idocrase are found in the lava of Vesuvius, whence the name vesuvianite. It is in color hair brown to olive green. This variety is sometimes used as jewelry, and is called Italian chrysolite in the trade.

It occurs in a few localities in the Eastern States of the Union, and in at least one on the Pacific coast, from which a beautiful specimen has been sent to San Francisco.

Xanthite (from its yellow color,) is a yellowish brown variety from Amity, New York.

Cyprine is blue idocrase, said to owe its color to the presence of copper, whence the name. It occurs at Tellmark, Norway. There seems to be some doubt as to this veriety. Thomson maintains that it is a variety of grossularite and contains no copper. The following is his analysis: Silica, 38.80; alumina, 20.40; protoxide of iron, 8.35; lime, 32.00;=99.55.

Idocrase of pure green or brown is somewhat in demand, but does not find many admirers, nor does it command a high price. It is more interesting as a beautiful mineral than valuable as a gem.

ABOUT a dozen men are now at work in the cinnaber mines on Beever creek, Jackson county, Oregon.

Testing and Working Silver Ores.

The above is the title of an illustrated work for miners and prospectors by Chas. H. Aaron, which will be issued next Wednesday by Dewey & Co. Mr. Aaron has managed to give a great many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Nolce's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements a small mill, sampling tailings and settling tanks, dichloride of copper, etc.

The book is a serviceable one for miner's and prospector's use. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

KNIGHT'S American Mechanical Diotionary is a book for all persons who make, bny, sell, use, or want to know anything abont tools for machines, or are onrions as to the history and development of mechanic art. It is a descriptive word-book of tools, instrnments, machines, chemical and mechanical processes; civil, mechsnical, rsilway, hydraulic and military engineering; a history of inventions; general technological vocabnlary; and digest of mechanical applinnces in science and the indnstrial and fine arts, etc. For circnlars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

The McCormick Self-Binder.

C. H. & L. J. McCormick, tho most celebrated inventors snd manufncturers of mowing nnd harvestiag machinery in the world, are aot behind the times in producing s thorough working, durnble and reliablo self-biader sttachment to their well-known and justly celebrsted reaping machines.

After haviag heca carefully tested in the West ern Stntes, where the mnufactory is located, during tho past seasoa, a most perfect working mschiae will bo offered to the farmers of the Pacific const next senson, at very favorable rntes.

The editors of this journal have seen dozcas of favorable testimonials from parties who have witncssed the operations of these binders or used them in the field in Iown, Missouri, Illinois, Indiana, Minnesota and Nebr nska.

Further information can be had by addressing or calling upon Mr. P. Mohan, McCormick's, general ngent, st No. 6 Dsvis street, S. F.

WOODWARD'S GARDENS embraces an Aqnarinm, Musenm, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponde and Skatiug Rink.

EVERYONE afflicted with those maledies for which the external application of enlphur hae long been known to be efficacione, can prepare a sulphur hath without resorting to puhlic bething honscs. GLENN'S SULPEUR SOAP furnishee the meane. Sold everywhere.

And in accordance with law, and an order of the Board of Directors, made on the first day of July, 1876, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, room 10 Steveneon Block, on the 18th day of September, 1876, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JAMES McHAFFIE, Secretary.

Office, Room 10 Stevenson Block, San Francisco, Cal.

POSTPONEMENT.—By order of the Board of Trustees of Kearsage Conecolidated Quicksilver Mining Company, the above sale is hereby postponed until Monday, the twenty-fifth day of September, at one o'clock P. M. JAMES McHAFFIE, Secretary.

Mariposa Land and Mining Company

of California. Location of principal place of business, San Francieco, Cal. Location of works, Mariposa county, Cal. Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh day of September, 1876, an assessment, No. 7, of one dollar ($1) per share was levied upon the capital stock of the Corporation, payable immediately in United States currency, to the Secretary, at the office of the Company, room 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal., or to the Assistant Secretary at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the ninth day of October, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday the thirtieth (30th) day of October, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

LEANDER LEAVITT, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

Mariposa South Mining Company—Location of principal place of business, San Francisco, Cal. Location of works, Spanish Selt Mining District, Nye county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the eighth day of August, 1876, an assessment, No. 1, of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of September, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Tuesday, the seventeenth (17) day of October, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.

Office, Room No. 2, 418 California street, San Francisco, California.

Northerly Five Cent Hill Gravel Mining Company. Location of principal place of business, San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock in said company, on account of an assessment, levied on the ninth day of August, 1876, the several amounts set oppoeite the names of the respective shareholders, as follows:

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44 00
Cost for one ton	2.93⅓

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

DEETKEN'S

ROASTING FURNACE,

For Gold, Silver and Copper Ores.

The roasting capacity of the Furnace, per 24 hours, is from 6 to 50 tons, according to percentage and nature of the sulphureted ore, with an expenditure of one and a half to two cords of wood, and two to three shifts of unskilled labor, according to amount of ore handled. The Furnace is adapted for chloridizing, as well as oxidizing, roasting, and for the manufacture of sulphuric acid. In point of cheapness of construction and efficiency in working, the Furnace is far the best in use. Millmen in need of a cheap and efficient Roasting Apparatus will apply to

G. F. DEETKEN,

Consulting Metallurgist, Grass Valley, Cal.

Furnace can be seen on application for permit, at Grass Valley.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

Catalogues and Estimates given on application.

DEWEY & CO.,

American & Foreign Patent Agents,

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent.

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

Address DEWEY & CO.,

MINERAL CITY, WHITE PINE Co., NEV., May 2d, '76.
MESSRS. DEWEY & Co.—*Gentlemen:*
I have just received Canadian letters patent for Fuse Lighter. Also, Canadian letters patent for the Drill Extractor. I return you my thanks for the able manner in which you have conducted the business.
Yours respectfully, JOHN W. PLATT.

WHITE'S PATENT

Revolving Cylinder Furnace

—FOR—

ROASTING ORES.

This Furnace was patented first in 1864, and subsequently in 1865, covering any arrangement of an incline cylinder furnace. It consists of an iron cylinder mounted upon bearing drums or wheels at a suitable inclination, with a fireplace at either the upper or lower end of the cylinder as desired. The cylinder is revolved by suitable power, and the ore is fed into the upper end of the cylinder continuously, and passes through its entire length.

During its passage the ore is raised by projections on the inside of the cylinder and allowed to drop through the passing heat, thus completely roasting it. The operation is continuous and requires but comparatively little skill and attention in working. It is simply constructed in sections, easily transported, and can be moved and reset at moderate cost. After thorough trial it is found to reduce a large variety of ores economically, and is now superseding furnaces of perhaps greater, but briefer notoriety.

Favorable terms will be offered to purchasers. Address for further information,

GEO. W. WHITE,

Care of Etna Foundry, Fremont Street, near Folsom, S. F.

NOTICE TO PARTIES ORDERING FURNACES.—The mining public is hereby notified that all persons who represent themselves to be my agents or to have authority under my patents to build and use, or to contract with others for the right to build and use a Cylindrical Rotary Roasting Furnace (except in Lander county, Nevada,) are fraudulent, and any person or persons that constructs one of my furnaces either with or without additions, alterations, or supposed improvements, or attempts to use one constructed under a contract with any such unauthorized person, will be prosecuted as infringers of my rights on the premises. I have made arrangements to have all my furnaces constructed by the Etna Iron Works in this city, and no other foundry has a right to make one without my written consent. For rights to build and use, address

GEO. W. WHITE, Patentee, care of Etna Iron Works.

Scientific & Practical Books on Mining, Metallurgy, etc.

Published or issued, wholesale and Retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly steemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

THE MINING AND SCIENTIFIC PRESS is the leading journal of America. Now proceeds and mechanical inventions are illustrated and discussed in its weekly issues. It is a 16-page sheet, handsomely printed, for $4 per year. Dewey & Co., publishers, San Francisco. —[Mt. Lincoln News, Alma, Colorado.

Facts About Peat.

[Written for the PRESS by SAMUEL PURNELL.—No. 6.]

On the Wurtemberg railway peat has entirely supplanted coal for locomotive use. On the Bavarian railways the use of coal and coke has been nearly discontinued and the use of peat has taken its place; it was found to be only half as expensive as coal. The use of condensed peat has more than doubled while that of ordinary peat has declined. On the Belfast & Northern Counties railway a peet trisl gave the following results: Total mileage, 74 miles; weight of train, including engine, 70 tons; ordinary amount of English coal used per mile, 25¼ pounds; peat consumed per mile, 21 47 pounds. Commencement of journey was up an incline of one to 80, four miles long with double curves; while going up the incline the firesure rose from 100 to 120 pounds, with the fire door open all the time. Speed, when permitted, 40 miles per hour. While in motion no smoke was emitted, and very little while standing at stations. There was no more clinker than from coal. Smokestack free from cinders and dost. One ton of peat gave a mileage of 100 miles. This is the most favorable report of peat that has come to hand, and it must have been a very superior article. Peat is in constant use on the railways between Berlin Dresden. Condensed peat occupies about one-half the space in a tender that wood does. No sparks or cinders fly from a peat-burning locomotive, thus reducing the number of fires along a line, and rendering traveling more pleasant to passengers. An increased economy results from experience in its use by engineers, and when locomotives are specially adapted to its peculiar requirements. Peat fuel fires are more easily managed than coal fires when once understood, require but little stoking and the heat is regular. One day during October, 1875, on the Central Pacific railroad, a train was run from Oakland wharf to San Jose with uncondensed and air dried surface peat from Venice island. The engine steamed easily, but it was pronounced impossible for one man to keep the furnace supplied. The run consumed 3,000 pounds of this peat, as against 1,600 pounds of Seattle coal commonly used. During the same month and with the same variety of peat, on shifting engine No. 116, 13,296 pounds of peat were used. Mileage, 336 miles; 39.57 pounds of peat used per mile run, This same engine was accustomed to consume 26.51 pounds of Seattle coal per mile run. This shows that the peat was but two-thirds as valuable as the coal; closely bearing out the views before expressed.

The discrepancies and differences in valuation and cost of peat in the foregoing statements are not susceptible of accurate adjustment. The only method of partially reconciling them is to consider these facts: that the composition of peat is not constant; that it not only differs in different countries and places, but even in the same bog; that in different places it varies greatly in its preparation for market; in dryness; in mode of combustion; in density; in foreign matters, etc. It has nearly always the prejudices of engine men and others to contend with, because of its extra labor and strangeness, who are apt to exaggerate its faults and overlook its merits. If it can be furnished at a less price relatively than coal, there is no reason why it should not be introduced. At $4, wholesale, per ton, peat condensed and thoroughly air dried would surely be cheaper than the coast coals at $8, cargo rate. As compared with the coal at $8 per ton, the peat at $6 would be at about an equal price. At $4 per ton, the use of peat would be a saving of some 50 per cent. in train mileage.

Other Uses.

Peat dust is a valuable absorbent of liquid manures, and is largely used in France for this purpose. By distillation peat yields gas, tar, paraffine and light oils abundantly. These oils are of low gravity and burn well in lamps with a brilliant white flame. Irish bog peat yields 3 57 gallons of refined oil per ton. Peat yields about 8,000 cubic feet per ton of illuminating gas of a low candle power: its coke answers well for maintaining the fires under the retorts. It has been proposed to utilize peat for gas purposes by mixing it with very rich coals. The ashes of peat constitute an excellent fertilizer for all kinds of crops. In Ireland peat charcoal has been highly esteemed as a medicine in dyspepsia, sick headache, etc. It is an admirable antiseptic. For glass melting, peat is a fine fuel, by reason of its smokeless flame. For paper making peat answers very well, the paper closely resembling that made from straw; it can be made tough by the addition of 10 or 15 per cent. of rags, as is done in Germany.

Peat in California.

This State is abundantly supplied with peat. The moss-plant grows in the Sierras, in the valleys, and on the coast. The islands of the Sacramento and San Joaquin, the tule and swamp lands along the rivers and bays, are in great part formed of peat. Much of this peat is quite inferior, by reason of its containing salt or sand in large quantities, but the most of it is available for fuel. Mountain peat, by reason of heavy rains and washes of sand and clay, is generally inferior to that of the valleys. The peat deposits of the lower San Joaquin, and of the coast counties of California, are very extensive and of fine quality, and if utilized would undoubtedly furnish a cheap fuel for many years. One thousand acres of these bogs have been estimated to be capable of producing 200 tons per day for 20 years; and a space 40 by 12 by 17 feet, to produce 45 tons of dried peat. One cubic foot of this peat condensed and perfectly dried will weigh from

Dead Chimney of Geyser.

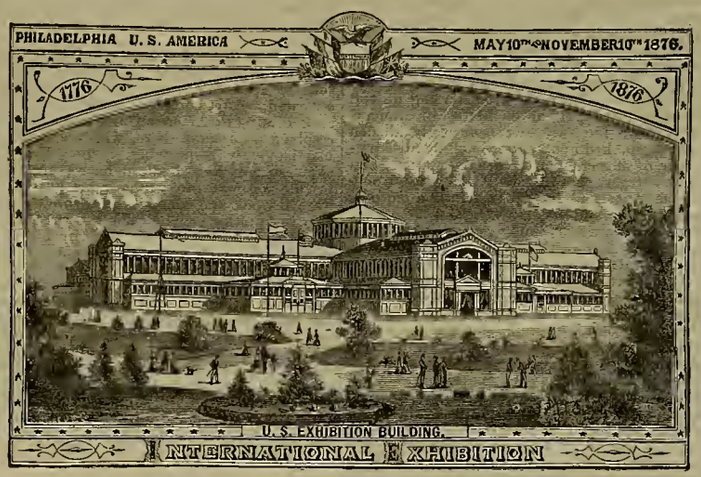
30 to 34 pounds and contain from six to ten per cent. of ash.

Since the peat resources of California are almost unlimited, the climate admirably adapted to peat manufacture, and the coast coals of an inferior quality, it would seem that the production of peat on a commercial scale might prove profitable. That it is a good fuel when well prepared is incontestable; the only question is, whether it can be produced at a figure which will permit of its undersselling the coast coals. If so, it would find a ready sale; but it seems that for this purpose it should not cost per ton more than two-thirds, or at most three-fourths as much as the coast coals.

S. CAMERON, of the Cable mine, has forwarded the richest and most magnificent specimens of gold to the Centennial that have ever been taken from a Montana mine.

The Government Building.

One of the most interesting and instructive features connected with the Centennial is the United States Government building. This building has been erected by the United States Government at a cost of about $110,000, that amount being derived from the fund of $500,000 which was appropriated by Congress to enable the Government to become an exhibitor at the Centennial. The construction of the building is in the general form of a Latin cross—the larger dimensions of which are 360 in length, the smaller 300, each being 180 feet wide; the whole covering an area of about 81,000 square feet. The building presents quite an imposing appearance, with its large dome and its conspicuous display of national hunting. It is filled with exhibits from the army, navy and treasury departments, and from the Patent Office and Smithsonian Institute, each exhibit being under the general supervision of an officer or person especially detailed for that purpose. The Smithsonian Institute, which covers also a general mineral exhibit, is under the special



direction of Prof. Wm. P. Blake, formerly of California. The illustration on this page gives a general view of the building. Our editorial correspondence from Philadelphia, in our issue of Sept. 2d, gave a summary of the contents of the Government building.

Hopkins' Improved Rails for Street Railways.

Mr. C. T. Hopkins, (President of the California Insurance Co., No. 318 California street,) has lately patented through our office an invention which when generally adopted will be

Improved Railway Track.

hailed with satisfaction by thousands who ride in vehicles about our city in peril of being thrown out, or of having their carriage upset by the wheels sliding in attempting to cross street railways.

The accompanying engraving shows in how simple a manner Mr. Hopkins accomplishes his object, with little if any extra expense, *i. e.*, by constructing rails with notches efficient to take the wheels over the track in an easy manner.

A DISPATCH from Cheyenne of the 16th inst. says: The Wheele Brothers, who have been working their famous claim No. 2, below Gayville, on Deadwood creek, arrived at Laramie last night, with a paid escort of 20 men. They bring, as the proceeds of their work for seven months, over $300,000 and 1,900 pounds of dust. They will bring their escort to the railroad at this city.

[Copyrighted.]

Mechanical Ore Concentration and Separation.—No. 7.

(Written for the PRESS by FRANCIS F. M. CAZIN, M. E., Santa Fe, New Mexico.)

The sizing is an inseperable appendix to the separation proper, and while the breaking in part is independent of the dressing, sizing can never be so, because the loosening of particles resulting from all sizing operations should immediately and uninterruptedly be utilized for the separating action, and no settling should be allowed between the two if at all avoidable. It therefore results that although the breaking part may be locally isolated from the separating machinery, the classifying (sizing, washing) part should not be.

Here, also, should be an answer given to the very important question

What Mines Should Work Their Ore

By mechanical concentration? This question may be very distinctly answered: All mines producing ore enumerated as belonging to the first class, containing no valuable parts, unless they surpass in specific gravity for one unit all other mineral matter in the ore. On coal and slate the same is applicable, with the difference that the waste (slate) separates as the heavier part.

In all these cases, under circumstances normally favorable, mineral dressing, independent or preliminary to any reduction process, is the most economical.

Breaking of the Ore.

We will now discuss how far this should go, and with what machinery it should be done.

The question how fine ore should be broken for the purpose of dressing can never be considered a general one, but will remain in all cases where ore is to be dressed a special one, to be answered with regard to the special quality of the ors.

In ore having the appearance and character of a conglomerate, wherein the rock particles and metallic particles are present in about the size of peas, would it not be waste of labor (mechanical or manual) to break it further than to allow the particles of different qualities to break the one from the other. Nature favors such action by the cleavage between different materials, being usually more brittle and apt to separate than of the materials within themselves, or of one of the materials within itself. But independently of the waste of labor, the breaking into smaller particles than required by the nature of the ore is accompanied by other disadvantages besides, because the percentage of loss in dressing operations increases as the size treated decreases. This fact has been established by long experience where mineral dressing is a part of all mining operations successfully carried on.

Extinct Geysers.

In speaking of the geysers of the Yellow stone country and their geological features, Professor Hayden states that traces of even greater activity than we see at present are found in some localities, and it is more than probable that the force is gradually dying out from year to year, and that finally it will cease entirely. We have numerous localities in this West where there have been vast groups of hot springs and geysers, but at the present time only ruins are left. It would seem probable that the heat that gives the temperature to the atmospheric waters, rises through numerous fissures from one common source in the interior of the earth, so that when from some cause this heat is checked in its upward progress in one place, it finds vent in another, and thus passes from point to point over a district. It is probable that they have existed since the period of volcanic activity, and that now they are diminishing in force, so that eventually nothing but the deposit will remain. Large numbers of old chimneys, such as the one shown on this page, are scattered over the surface, formed by what may properly be called pulsating geysers.

CORRESPONDENCE.

[Editorial Correspondence.]

Summering by the Seaside.

Worn down with the nnnsual heat of this extraordinary aeason, your Centennial correspendent hss joined the great *hegira* to the sea side and country resorts for a little relief and recuperation. A sndden transition by rail and steamer from Philadelphia to the interior of Maine rendered the substitution of an overcoat for the nsual summer wear an essential to comfort; bnt the change was qnite too great, and we sought a change of locality in a quiet retreat among the uniqne attraotions of Martha's Vineyard—a locality which has no superior for refreshing and invigorating air, sea bathing, fishing, free sociability and all the varied enjoyments aought for by those who visit places of summer resort. This island, looated jnst off the aontheastern portion of Massachusetts, has long been noted throughout the maritime world for its great hsrbor of refuge for sea going vessels, and for its pretty nestling villages at "the head of the harb or"—formerly known aa Holmes' Hole, but recently rechristened with the more euphoneons title of Vineyard Haven. Bnt its later and now most leading attraction is its celebrated seaside resort and "city of cottages" at Oak Blnffs, on the esst side of the harbor, and about two miles distant from the village. I have thonght that the general interest attached to this locality is amply sufficient to make it a proper subject for a letter to the PRESS.

"City of Cottages"

Is a most appropriate title for this great watering place. When we arrived it was just entering npon the full tide of its summer prosperity, and was literally crowded with visitors. Some 20 yachts were lying in the offing or in the neighboring harbors of Vineyard Haven snd Edgarton. Six or eight large steamers arrived during the day loaded with pleasure seekers from Boston, New York, New Bedford, Providence and other distant places, and the neighboring harbor was crowded with its usual fleet of transient shipping.

This watering place, although generally known as "Oak Blnffs," is really divided into three more or less distinct commnnities. The principal landing place is at the Oak Bluff wharf, immediately adjscent to a large hotel known as the Sea View house, the largest structure on the island, and one which forms a conspicuous object to all who approach the locality either by sea or land. It is an elegant and ornamental strnctnre, four or five stories high, and is crowded with guests dnring the entire season. The grounds in its immediate vicinity are laid out in winding avennes, walks, squares, circles, etc., and mostly bnilt np with highly ornamental cottages of one and two stories in hight. There are seversl other hotels besides the one mentioned, also stores of various kinds, hakeries, restanrants, etc., a fine ornamental strncture for pnblic worship and other assemblies, and a postoffice.

Jnst beyond this, and separated by a line fence only, with numerous convenient openings, is located what is known as the Methodist Vineyard camp gronnd, covered with a dense and thrifty growth of oaks, mostly small and somewhat scrnbby, but well filled with leaves, and shady. The present season is tbe semi-centennial anniversary of its occupation as a camp ground. These grounds are also tastily laid out and bnilt np. A large tent, capable of sesting some 3,500 people, occnpies a central position, and is used as a place for pnblic worship. I have jnst learned that the managers have pnrchased one of the Centennisl buildings at Philadelphis, and will take it down in sections and remove it to this locality, to hereafter take the place of the tent. The camp meeting season continnes for one week, bnt the cottages are mostly occupied for about three months.

A few rods beyond thia, and separated therefrom by a beantiful sheet of water known as the Lagoon pond, is the Baptist csmp gronnd, which having bnt recently heen occnpied, is not yet bnilt np to any great extent. This place is also covered with thrifty yonng osks, and will, no doubt, soon become as densely populated and as fnll of life as its neighbor across the pond.

From the above it will be seen thst we have here qnite a "peculiar institution"—a Methodiat and a Baptist associstion intimately connected with a Gentile commnnity—for the residents at the Blnffs are known here ss "Gentiles." These different communities, esch under its separate municipal or religions management, form a harmonions whole, each carefully striving to avoid any collision or interference with the other. The times for the camp meetings are set for different weeks, and the Gentile commnnity is as csreful as possible to avoid all "unpleasantness" which might naturally arise between those who visit the locality to seek plessnre alone and those who aeek to mingle innocent pleasure and social enjoyment with religious worship. The entire community constitntes a great "happy family," striving to harmonize, as far as possible, different instincts and various social inclinations. The locality can justly olsim all the natursl attractions possessed by any similar plaos, and many others that are fonnd nowhers elss.

A Fairy Scene.

There is a pecnliar freedom, esse and free sociability here which is not met with at any other watering place, and which is in marked contrast with such places as Newport, Long Branch, etc. It is impossible to conceive of an orderly community more entirely given up to innocent and health-giving plessure, or ons more completely contented and happy than are the people who freqnent this grest summer city by the sea, numbering at timea from 20,000 to 30,000 sonls, gathered promiscnonsly from almost all parts of the conntry.

The cottages are pecnliar to this locality. With great diversity in minor details, they are much alike in their general festnres. They are bird-like structnres, with pretty bnt somewhat fsntastic ontlines, and are mostly constrncted with broad, folding front doors, which are generally kept wide open, presenting a sort of *fete* appearance, and revealing to the passer by an endless diversity in taste and ornamentation within, and a seeming invitation to pause and stndy them ss one would a display in one of the great exhibition bnildings on the Centennial gronnds. Some of these interiors are marvels of simple beauty, ease and comfort, especially when they are brilliantly lighted, as they are in the evsning. There are but few cnrtains here to shut ont the stranger's view. Snites of rooms are divided by looped-up drapery of lace and damask, all open to pnblic gsze and stretchiog far bsck from room to room in charming vistas of simple, home-like loveliness. The open piano or organ, odd and nnique pieces of furnitnre, pictures and paintings, birds, flowers, etc., are chsrmingly arranged, while the occnpants, with their families and visitors, sit at tbeir ease in picturesque gronps within and without the doors, pnblicly but not ostentstiously exposed to view. Not nnfrequently, in the cool of the closing day, the vista is closed by a party at a tea-table tastily set and covered with viands, flowers and fruits. No offense is taken if the passer by slacks his pace a little or even stops a moment to gaze npon the charming, unique scene before him. Music, singing and innocent langhter is heard without and within. Now the mnsic from a passing band swells ont npon the breeze; then, afar off, is heard a thonsand voices in the great tabernacle, singing, to the accompaniment of cornet and organ, some grand old sacred melody, or, perhaps, the sweeter modern hymn, "Nearer, My God, to Thee." Troops of ladies and gentlemen and children are constantly promenading np and down the principal thoronghfares, or wsndering throngh the leafy and beautifnlly shsded byways, flanked npon either haud by little parterres of flowers, rnstic ornamentations and open cottsges, gay with simple hangings, trooping children and happy fathers and mothers and brothers and sisters. These promenades remind me mnch of similar scenes at the Centsnnial grounds, or the evening promenades at the Institnte exhibitions in San Francisco.

The bnsiness man here throws care to the winds; the grave and thoughtful lay aside their dignity as a garment not fitted for the occasion; old men become boys, old ladies girls, and each seems to vie with the other in trying to make everybody happy. Children fairly run riot here in innocent gaiety. I am told it is not nncommon for mothers to place a csrd, bearing the name of the parent and plsce where the cottage is sitnated, on the dresses of very young children and allow them to wander off at will among the crowd. If they get lost, as they often must among the mazy labyrinth of streets and cottages, some one, a police officer or other person, will be snre to bring them bsck. The leafy, sheltering oaks almost completely shnt out the sun, and except in the principal avenuea no horses or carriages or cars are allowed to endanger life or limb. The glowing faces and bounding steps of the little innocents fully attest to the rich store of health which they are gathering up from the pure sir and invigorating breezes of

"This island of pleasure, of love and of song."

To one coming npon this scene for the first time, in the evening, when the thoussnds of cottages and tents are lighted np so as to display everything to the follest extent, it is truly like entering npon a fairy land. The world nowhere else presents snch a scene of lovely enchantment and delight. And what is most remarkable, dnring my protracted stay here I never witnessed a single act of disturbance, incivility, coarseness or impropriety. If there are policemen around—and I am told there are—they are not known from any other citizen by either dress or insignis. It is really wonderful that a commnnity so large, so mixed and so constantly changing, and gathered from all parts of the conntry, should be kept so orderly and quiet with so little apparent effort. I can compare it to nothing hnt the early times in California, when we had neither laws nor lawyers—when every man was law to himself, and when the lesst encroachment npon the rights of another met with sure and swift retribntion from an indignant commnnity, without the intervention of either jndge or jury.

During some days I am told that from six to eight thonsand persons arrive and depart within 24 houra The arrivals on two different days since I have been here were estimated at about 10,000 for each day. The nnmber of steamer arrivals on those days were some 12 or 15, to say nothing of sailing vessels. The railroad, here as elsewhere, has been bronght into requisition for the convsnience of visitors. A circular horss railway runs aronnd and about the gronnds, by which visitors may very easily get a general view of the same. It is abont three miles long, and no doubt gave the idea for the steam narrow gauge at the Centennial grounds in Philadelphia, which has been constrncted for a similar purpose. A steam narrow gange railway, some eight miles long, connects this place with the neighboring town of Edgarton, and the sonth beaoh at Katama, where lovers of clambakes and an open sea view with heavy beach rollers love to congregate. Clambakes are served np there every day.

A Bathing Scene.

A sesside watering place ia nothing without conveniences for bathing, and here that luxury can be enjoyed to the fullest extent and with the greatest safety. Eleven o'clock is the nsual bathing honr, snd always affords a most jovial scene. Lovely woman is lovely anywhere, bot by many she is considered most lovely when in salt water, if she only knows how to dress herself properly for the occasion. A jolly democracy is a bathing crowd of lsdies. One cannot, on snch an occasion, tell the wife of a railroad king from that of a horse jockey, nor a senator's daughter from a conntry schoolmarm. Such a crowd is also nsnally an amusing as well ss an enlivening spectacle.

A few days ago qnite a little sensation was created among the bsthers and lookers on at the "Blnffs." For the convenience of those who wish to enter deep water, a platform hss been reared just above high tide, with a flight of steps at its outer extremity from which tbe fair swimmers may descend gently to the sea. But a few days since, just ss a number of ladies had appeared npon the platform, one of them msde a sudden stsrt, rushed swiftly along the planks, and without stopping to descend the steps plnnged boldly, man fashion, into the sea. There was a hushed silence for a moment; msny thonght it was a case of snicide, and some gentlemen in a boat were abont to rnsh to the rescue; bnt in due time the fair swimmer rose to the surface, shook the salt spray from her dark tresses, strnck boldly out for a swim, and by her skillful manenvers soon proved that she was an expert in snch aqnstic exercises. "Who is she?" was the inquiry which passed from month to month. It was subsequently msde known that she was a native of Honolnln, in the Ssndwich islands, where almost every female learns to buffet the snrf eqnal to the boldest man.

This lady, for she is a lady snd is trested as snch in "society," is of "royal blood," and was sent to New Bedford, maoy years ago, to be educated. After completing her edncstion sbe took a liking to American life and society and resolved to remain here, which she did, and married very respsctsbly. When King Kalakana was in New Bedford he was tendered s private reception, to which none hut the *elite* were invited, and among the favored was the lady in qnestion. When she was presented to the king she addressed him in his native tongne, calling him by his given name with the prefix of cousin, which term expressed the relationship between them. He at once recognized her, expressed moch pleasnre at meeting her, and remarked that her friends were very anxious that she should return to Honolnlu, and that he wonld be happy to have her go back in his company. She respectfully declined, however, and assured him of her fixed determination to remain and pass the remsinder of her days among those who hsd been so kind to her in this her adopted home. W. B. E.

Vineyard Haven, Sept. 1st, 1876.

Lieu Lands.

Modified Decision by Secretary Chandler.

The State Board of Lsnd Commissioners received on Friday, from the Department of the Interior, Washington, the following modified decision in the case of Selby, et al., pre-emptors, vs. the State of California:

DEPARTMENT OF THE INTERIOR,
WASHINGTON, Angnst 18, 1876.

Sir: The case of George C. Selby et al., pre-emptors, vs. State of Csliforna was decided by me under date of March 10, 1876, in favor of the pre-emptora.

It having been shown that this decision affected the title of the State to a very large and valuable body of lands, and that the State anthorities, being nnaware of the pendency of the case, had fsiled to present any argument in support of its title, a rehearing wss ordered by me, and very full and exhanstive arguments have been presented in behalf of both parties. Never doobting that all sections of lands made by the State of California in lieu of the 16th and 36th sections embraced within the limits of a private grant before the approval of the snrvey of such grant were irregnlar, and not in conformity with law, and being informed that the subject of confirming such selections was pending in Congress, I have withheld my decision in the case for the action of that body.

Congress having adjonrned without legislating on the snbject, it becomes my duty to dispose of the case. It cannot be doubted, and I do not nnderstand it to be questioned by the attorneys for the State, that the right of the State to make their selections only attaches when the finsl snrvey of the grant is made. Whether a snrvey is final or not can only be known when it receives the approval of the commissioner of the general land office; consequently the right to select can only be exercised by the State npon snoh approval. Tested by this rule, the selections made by the Stste of the lsnds in question were prsmatnre and irregular, and if the liats containiog the same were now presented to me for approval, I should be compelled to reject the aame. But I learn that the State, in many instancss, hss proceeded to make selections without obtaining lists from the Surveyor-General, and these selections have subsequently been certified by yonr office and approved hy this department, and on the faith of snch spproval thonsands of acrss have been sold to bona fide pnrchasers. On many of these lsnds improvements have been made by such pnrchasers, and their valne therehy become greatly enhanced. From the date of the approval of these selections the lands have been treated by your office as the property of the Stste, and not subject to entry noder the homestead and pre-emption laws of the United States.

Under these circnmstances no settler who has gone npon the selected lands snbsequent to tbe approval of the selection can complain that he did not hsve full notice of the claim of the State and of the action of this department. If any person enteriug adversely to the State hss msde improvements on the land, it has been done with fnll knowledge that nnder the rulings and practices of your office no entry by him wonld be permitted.

It is contended by counsel for the State thst the approval of the selectious by this department relates back to the date of selection, and is not snbject to revision, but is conclusive npon me. I am not prepsred to yield full assent to this doctrine. The selection was not made by any officer of the United Ststes, and could not bind the government.

It wss made without authority of law and possessed no validity until it received the approvsl of the Secretary. From the date of its spproval it operated as a reservation of the lands from private entry, bnt the approval under such circumstances should not be held to relste back to the date of selection to the injnry of adverse claims to the lsnd. In this case it appears that the township plats were filed in the land office at San Francisco, April 22d, 1868, and the greater part of the lands were selected by the State on the ssme day; one tract was selected May 12th, 1868, and on the 27th of May, 1868, the plats were withdrawn by the Surveyor-General. The plats being withdrawn, from the record it also appears that the selections were entered np by the Register. The plats remained withdrawn nntil November 21st, 1871, when they were filed in the Los Angeles district, within which the lands in question were tben sitnated. In the meantime the parties olaiming under the pre-emption laws allege that they settled npon the land in good faith, without notice of any claim by the State. The selections were approved by Secretary Delano on the 24th of November, 1871, with the exception of southeast qoarter section 29, townsbip 2 sonth, range 13 west, which was approved Octobsr 26th, 1872.

Selby, Wilkinson, McClain, Green, Foster, McCreary, Ketchum, Douglas and Hand were each allowed to file D S. for the lands occnpied by them. Their filings were promptly offered, in some instances before the approval of the selections, and in every instaoce within 15 days after the filing of the plats, and each allege settlement long prior to November 21st, 1874, thongh snbsequent to April 2nd, 1868.

I cannot learn that their filings were csnceled by yonr office, or that any objection was made thereto, until they offored to prove np and pay for the land, when the entries were held by you for cancelation, and the case is now here on appeal from thst order.

Jamea Pierce applied to file Febrnary 14th, 1873, alleging settlement July 25th, 1870, and Joseph McEvoy applied to file March 29th, 1872, alleging settlement October 21st, 1871.

In view of the facts above stated, I am of the opinion that my decision of March 10th, 1876, shonld be vacated, and the selections approved by this department to the Stste before final snrvey of said grants should be permitted to stand, snbject to the followiog qualifications.

First.—All subsisting homestead or pre-emption rights which antedate the approval of the selections shonld be allowed priority over the claim of the State.

Second.—Whenever upon approval by your office of the snrvey of a private grant, it ahall be fonnd that any section or part of section for which lien lands have been selected, falls without the survey, the selections so made shall be deemed invalid unless the State ahall substitute therefor another sixteenth or thirty-sixth section, for which it shall then be entitled to make selections. No further selections shonld be permitted in advance of the approval of the snrvey, and the Snrveyor-General of California shonld be instructed not to frnrnisb lists to the States of the sixteenth and thirty-sixth aections inclnded witbin the limits of any private grant, until he shall have received official information from yon that tbe snrvey thereof has been approved. Selections by the State should only be permitted upon the lists received from the Snrveyor-General.

Applying the rules above indicsted, I direct that Selby, Wilkinson, McClain, Green, Foster, McCreary, Ketchum, Douglas and Hand be allowed to make their final proof, and upon showing fnll complisnce with the law, they be permitted to mske payment and receive patent for their land.

The applications of Pierce and McAvoy came too late and shonld be rejected.

I retnrn herewith the papers transmitted with your decision. Respectfully,

Z. CHANDLER, Secretary.

To the Commissioner of the general land office.

SCIENTIFIC PROGRESS.

Hints for Amateur Chemists.

We have no doubt some of our younger readers who have a taste for amateur chemical work and are thrown upon their own resources for making a laboratory will thank us for the following hints on the subject. We reproduce them from a new book by W. W. Goodwin, on the analysis of coal gas. Mr. Goodwin writes:

Cleanliness is of the utmost importance; never put away anything dirty. It takes twice the time to cleanse glass vessels when chemicals have dried on them, that it does if washed directly after they are done with. Many persons have thrown away bits of dirty apparatus which they would have looked upon with pride had they polished them before putting them away. Do everything and arrange everything in order. Never be in a hurry or flurry; serious accidents may occur at times through not keeping cool. Have a place for everything, and put everything in its place. It is a good plan to make a list of all apparatus and materials required for the experiments which are to engage the attention. Satisfy yourself beforehand why you do everything, and never be content with making a thing merely do, if it is not done properly. Badly fitting corks, requiring lutes or sealing wax to stop the leaks, must not be suffered at any time; another should be fitted. Many a serious explosion has occurred for want of these precautions. In all cases use the simplest form of apparatus for an experiment; unnecessary complications are confusing.

Take careful notes of experiments as they proceed, on paper or in a rough note book. Dr. Hofman used to say, "the scrap of paper well stained with acids is of much greater value than the half worked out though clean notes, written after the experiment has passed away." The rough notes should be reproduced in a more finished form in a book kept solely for that purpose. The mere copying of scientific facts and formulæ, previously learned in a practical way, is a great help toward remembering them.

Chemical operations should be carried on, if possible, in a room set apart for that purpose; it is better to have it on the ground floor, if possible, as water is more easily obtained, and waste carried off by drains. It should be well ventilated, with a flue in which there is a fire burning, or furnished with a ring of gas jets, to produce an ascending current. The flue may be furnished with a hood, under which experiments may be performed where noxious vapors arise. A zinc tube about two and a half inches in diameter, arranged over the bench, about a foot from the ceiling, with inverted funnel tubes over the gaslights leading into it, can be arranged to produce an upward current, and will keep the room clear. This may be carried into the flue or out of doors. A chamber about two by one and one-half feet, with glass doors, should be fitted up in every laboratory, however humble, in connection with the flue, in which the experiments with sulphureted hydrogen, etc., can be carried on. This, however, can be made to lead out of doors also, by having a Bunsen constantly burning, the waste heat being used for a sand bath in which evaporations may be carried on if the chamber be divided by a partition. The principal sink may be either in the laboratory or just outside, and should be of glazed stoneware to resist acids. A small leaden or japanned iron basin may be let into the bench to carry off waste.

The room should be furnished with a working bench, say two and one-half feet broad, round the wall, and, if necessary, down the center. A nozzle with a stop-cock should be connected with the gas-pipe for attaching the flexible tube; narrow shelves should be fixed along the walls and over the bench, to hold the bottles containing materials and reagents. A cupboard or shelves may be put under the bench, and drawers fitted, to hold the various kinds of apparatus. Water must be at hand in a trough that can be emptied, or in pails.

The Damage by Frost.

We have formerly urged the advantage of protection against frost and recorded practical success with the employment of smoke clouds. We read that in some of our mountain counties and in Nevada the frost has already nipped garden crops. In this connection we print the following important facts in reference to the surface temperature of the earth, and the effect of shelter, which Dr. Barham communicates to the Royal Institute of Cornwall, England. He says that the very considerable difference between the lowest temperature, as indicated by the self-registering thermometer placed within a thermometer screen, and that shown by a similar instrument exposed on the grass and radiating freely into space, is an illustration of the influence of shelter. The common estimate of the greatest cold of night is derived from the record of the thermometer screened from radiation. This is what passes current as the minimum temperature, and that not only among the public, but also generally with those who pay a good deal of attention to meteorology. Yet when the sky is clear, the temperature of the grass, and that to which vegetables, men, and animals out of doors are exposed, will be from five to ten degrees lower, and sometimes more; and it is just these additional degrees of cold that, when an ordinarily sheltered thermometer indicates pretty sharp frost, destroy tender plants and often more or less seriously affect the health of the delicate, the old, and the very young. According to the records of Captain Liddell the radiating thermometer was, during 1872 and 1873, on 25 occasions, from 10 degrees to 13 degrees colder than the sheltered thermometer. Most of these cases occurred during April, July, and August. Owing to the different powers of absorption and radiation possessed by different kinds of earth, it is found that garden loam has the power of receiving and retaining heat superior to that of any other naked soil. The temperature of peat is nearly equal to that of garden loam although it is wet and cold to the sense of touch. A covering defends the naked soil from these extreme effects of radiation, no matter whether the covering be a natural one of grass, or an artificial one, such as screens of muslin, straw matting, clouds of smoke, or mist. The beneficial effect of a covering of muslin is not quite equal to that of straw matting, but the amount of protective influence of so slight a material is worthy of notice, amounting on the average to nearly one and one-half degrees, and in some cases to three degrees. It is said, as a general result, that in the climate of Cornwall the soil covered with vegetation will be from eight to ten degrees warmer in sharp frosts if screened from the sky by straw matting or other moderately thick materials spread over it three or four feet from the ground.

The Irwin-Ainsa Meteorite.

Some one sends us a copy of the Philadelphia *Inquirer* containing a paragraph descriptive of the famous Arizona meteorite which will interest some of our readers: This celebrated ring-shaped meteorite from Arizona, sometimes called the signet meteorite, now occupies a place in the Smithsonian department of the Government building. It was found in the early part of the last century in the Sierra Madre, somewhere near Tucson, Arizona Territory. There is a tradition among the old residents of Tucson that there was a shower of meteorites in the mountains there some 200 years ago.

In 1735 Captain Juan Bautista Ainsa, who then visited the region, undertook to transport this large meteorite to Spain. After getting it as far as Tucson he abandoned the undertaking, and the meteorite remained in that town, and was used as a kind of public anvil by the people. At length it fell into disuse and became partially buried in the ground in one of the side streets. It was found there by Dr. Irwin, of the United States Army, in 1857, and by the aid of Mr. Ainsa, a grandson of the Captain Ainsa here spoken of, it was transported to Hermosillo, in Sonora, and thence shipped to San Francisco, on its way to the Smithsonian Institute at Washington, D. C., where it has since been an object of great interest to all visitors, and especially to experts familiar with meteorites, who have readily remembered it by reason of its annular shape, and the large hole, some two feet in diameter, through its center.

It is the only annular meteorite of which there is any record, and is the property of the National museum at Washington. Its total weight is 1,400 pounds. One of the distinguished scientists at the exhibition inclines to the opinion that the large cavity in this specimen was originally occupied by sulphurous or earthy minerals, such as are often found in meteorites in a more or less globular condition, and which, by decomposition in the soil, leave the iron free and with a pitted surface.

PURIFICATION OF THE MORE FUSIBLE METALS BY FILTRATION.—Prof. Lampadius, of Freiberg, concluded that at a certain low temperature of fusion, the metallic impurities present in the more easily fusible of metals would separate, partially as such, and partially as definite, crystalline compounds, and float in the fused mass, from which they could be removed by filtration. Experiments by him in this direction were so far successful that the expected definite compounds were found upon the filter, but the metallic filtrate was still very impure. The filter was made of quartz-sand, slag, etc., which was not wet by the molten metal. Cutter, however, according to a communication by him, in trying to adapt this principle to the purification of Bohemian tin, on a commercial scale, sought for material for a filter, which would be wet by the metal to be purified without being dissolved in it. Iron, with its comparatively high temperature of fusion, and its adhesion for tin, as manifested in the tinning of iron, was employed for the filter. Five hundred strips of tinned iron, as thin as paper, about six-tenths of an inch long, and one-fourth as broad, were packed tightly in a square iron frame by the aid of wedges, and the frame was then luted into a suitable opening in the bottom of a graphite crucible. The tin, melted in a second crucible, was allowed to cool until the separation of fine crystals on the surface was noticed, and the thickening metallic mass was then poured into the filtering crucible, when the still fluid pure metal passed through, and a pasty magma was left, in which iron, arsenic, and copper, concentrated to a great degree, were found combined with tin, while the filtered tin proved to be almost chemically pure. Fifty hundredweight were purified in the crucible described. Other forms and other materials for filters are suggested, and other possible applications of the method, as in the separation of silver from lead containing the former metal.

MECHANICAL PROGRESS.

Hints to Carriage Makers.

From the *Hub* we quote a few hints to carriage makers, some of which will be found valuable in other lines of work:

Never, in welding light steel or iron tires, "edge up" or hammer on the edges at the weld. Weld solidly on the flat surface; trim the edges with a sharp chisel, and dress with a file. This method saves time and insures success.

In welding very light steel or iron tires, use a flat and smooth-surfaced cast or wrought iron block, in size about four inches square, and two inches thick. Warm the same in the fire, and place securely on the gauge, as near as is practicable to the fire. Then prepare your tires for welding, and weld them on the improvised anvil—or iron block—and dress up after welding on the anvil.

When putting in your buggy bottoms, have not less than three-fourths of an inch of open joints. This will allow ample room for the bottom to swell, and prevent it from warping.

The small pieces of carpet, known in the trimming shop as scraps, form a good material with which to cushion benches, trestles, and other appliances about the factory, and they will save many dollars in a year, by preventing bruises to bodies and other work.

Iron and steel hammers are quite appropriate for iron work. Leather-covered mallets will not do half as much damage about wood work as ordinary hammers, and this suggestion is particularly applicable if the operative is not a very careful man.

Cold and other chisels made from old files cost four times as much as those made from good cast steel. Moreover, the work done with them costs more, and is not done so well.

Good files do not cost nearly as much as labor. One man with a file, three days in use, will do more work in one day than two men will do with files that have commenced their fifth week of slipping and scrubbing.

A few pounds of coal spent in heating an iron occasionally is much cheaper than the labor spent in hammering cold iron.

A mixture of charcoal and bituminous coal makes the best kind of fire for steel tires.

A little water put on the glass in the factory windows, and a little more of the same liquid, mixed with lime, and applied to the walls and ceilings of the factory, will not cost much, and will give a better light, help to preserve the health of the operatives, and also produce more work than all the gas you can burn in the daytime.

Foreign Tribute to American Skill.

A marked tribute to the skill of our American mechanics has been accidentally uncovered in an order from France for duplicate parts of some rubber machinery. About 20 years ago an American mechanic, Alexander Hutchinson, left Trenton, N. J., with a set of rubber machinery to introduce that industry into France. From time to time sundry duplicate parts have been sent thither, while parts of new machines have been got out in that country. The factory being now the largest one in France and national pride instigating a desire that nothing further should be imported, they have been able to secure all the parts but the calender rolls; but as these are cast in an iron mold, the molten iron running against cold iron to make a hard surface, French mechanics have given over this job as impossible, and the order is now placed in the United States by Mr. Hutchinson himself. The casting in these molds is a high order of the mechanic arts, as the work is liable to crackle in the turn-out, while the tools to dress it off must be of the very hardest steel, and all set in the most powerful lathes, running so slowly as to be hardly perceptible. There is one foundry in Trenton, N. J., one in Pittsburgh, Pa., and one in Boston, Mass., which have successfully done this work.—*Boston Commercial Bulletin.*

ALARM SIGNAL APPARATUS.—Messrs. Cherry, of Hull, have introduced a new apparatus of this description for the prevention of collisions on railways. It consists of a tube to be fixed along the up and down line terminating at each station. Air pumps and alarm whistles, or similar appliances, are fixed on the tubes at equal distances from each other, so that when a train breaks down on the line, or is overdue and compelled to shunt to let another train pass, any of the officials, by working the nearest pump, which forces air through the tubes to the whistles, can give an alarm to the drivers or guards of the approaching trains either up or down the line, and at any distance between the stations, thus enabling them to stop the train and prevent collision. Stop-valves are fixed in the tubes, so that if desired one station only can be communicated with. The pumps may be protected with iron cases, the officials being provided with a key for access to them when necessary.

LOOSE RAILS.—A newly invented gong, that is constructed to warn engineers when they have passed over any rail that is loosened at the end, or in any way out of order, the gong indicating the fact to him and enabling him to give information of the fact, is being tested on the lines of the Pennsylvania railroad.

Cutting Cold Steel With Soft Iron.

B. S. Hedrick, of Washington, writes on this subject to the *Manufacturer and Builder*. We quote the following interesting points: The development of heat by friction has been long known. For some time it has also been known that the operation of rolling and rubbing had the effect of changing the molecular structure of iron and steel. These operations will toughen and compact cold iron, and will harden and condense steel. Some time since Mr. Jacob Reese, of Pittsburg, Pa., had occasion to construct a machine for cutting bars of cold hardened steel. For this purpose he mounted a disc, made of soft wrought iron, upon a horizontal axis, so as to be rotated with great velocity. With any moderate speed no cutting was produced. But, on giving the disc such a speed of rotation as to cause the periphery of the disc to move with a velocity of about 25,000 feet per minute (nearly five miles), the steel was rapidly cut, especially when the bar to be cut was slowly rotated against the disc. Sparks in a steady stream were thrown off. At first it was supposed that the steel was simply rubbed or ground off. But on examining the pile of accumulated particles beneath the machine, they were found to be welded together in the shape of a long cone, similar to the stalagmites in the limestone caves. They were nearly like the spikes of frost as formed in winter on Mount Washington, and illustrated at the Troy meeting. Real fusion takes place. The steel is melted by the swiftly moving smooth edge of the soft iron disc, but the disc itself is but little heated. The bar of steel on each side of the cut receives but a slight heat, and the ends are left with a fine blue smooth finish. By this process a rolled, polished and hardened steel bar of two or three inches in diameter, may be cut in two in a few minutes. The soft metal disc of iron used was about 42 inches in diameter, and three-sixteenths of an inch thick. The particles fly off in a thick jet or steam, apparently white hot, through which the naked hand may be passed without injury, and a sheet of white writing-paper held in the steam for a minute is not burned nor colored in the least. They glance off without burning the hand, having assumed the condition which causes the spheroidal state of liquids. The explanation of this curious phenomenon lies in the fact that the very rapidly rotating iron disc causes great numbers of particles of iron to come into contact with comparatively very few particles of steel, every particle of which has to stand the impact of thousands of iron particles; it thus gives way to superior numbers, this impact at the same time developing heat enough not only to melt the detached particles of steel, but to bring it in the spheroidal state.

TELEGRAPHIC IMPROVEMENTS.—G. W. Trabue reports in the *Journal of Telegraphy* his experience in using lightning rods along the several telegraph lines in western Tennessee to prevent accident and damage from lightning. On several of the routes in that part of the State, lightning rods were used, averaging two for every mile of wire for about 400 miles. He reports that the number of interruptions from lightning does not seem to have been lessened. No case of damage to a pole bearing a rod is reported, but the lightning has damaged poles in the near vicinity of these rods. Mr. Trabue thinks that to prevent lightning striking in between the rods, the latter should not be further apart than five or six poles. He intends to experiment with rods on every fifth pole on some of the lines under his direction. He also reports facts which seem to disprove the theory that the liability to damage increases as the number of wires decreases, as he shows that in several cases the lightning damaged poles bearing from four to seven wires, while lines with less wires in the immediate vicinity suffered no damage at all.

COSTLY PLATE FOR JAPAN.—Messrs. Garrard, the queen's goldsmiths, of the Haymarket, have just completed a most elaborate and valuable service of silver-gilt plate for the Mikado of Japan. It consists of a fountain as a center piece, supported on tortoise feet, with the traditional dragon and phœnix which recur so frequently in Japanese art and fiction as accessories. Within the fountain is an ingenious piece of mechanism, by which it will play and sprinkle rosewater or other perfumes for a considerable time. Then follow large and small candelabra, fruit stands, candlesticks, entree dishes, sauce boats, and other smaller pieces necessary to complete such a service. On all of these one or other of the traditional emblems of Japan, the tortoise, dragon and phœnix, have been introduced, while the minor ornamentation is generally floral, and remarkable for the recurrence of the chrysanthemum, so common both on Chinese and Japanese porcelain.—*British Mail.*

ENDLESS RAILS.—A trial was lately made in Paris, of the so-called endless rail of M. Clement Adar, with very satisfactory results. As reported in the *Journal of the Society of Arts*, the operation of the system is thus described: Three small carriages made up into a train circulate on a line of way formed by articulated rails, which are raised after the passage of the carriages, and are laid down again in front of them. The train, propelled by steam or horses, may at the will of the guard take any direction, and may even run over treacherous or sandy ground. The authorities have interested themselves in the subject and further experiments will shortly be undertaken.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

The Monterichard Mine.—Amador *Dispatch*, Sept. 16: A whim has just been put up on this mine, and as soon as the necessary rope arrive from San Francisco, the work will be again resumed. The present indications are that this will prove one of our richest and most valuable mines, and we hope that it will be worked without interruption in the future. There are several other claims in the vicinity of the Montarichard which develop splendid indications of richness.

Rich Strikes.—We understand that several very rich strikes in quartz have recently been made in the neighborhood of Mace's and Whitmore's sawmills, about 10 miles above here. We did not learn the names of the fortunate parties, but are told that the prospects are immensely flattering.

Buckeye Coal Beds.—Amador *Ledger*, Sept. 16: Coal of a superior quality to any hitherto found in Iona valley has recently been struck in the Buckeye mine. There is no doubt that the railroad company will now draw their supplies of coal from Buckeye, being five miles nearer, and the mineral at least equal in quality. The local demand, however, will be sufficient to cause the Ione deposit to be vigorously worked.

Volcano Tunnel.—Work is progressing upon the Volcano tunnel at the rate of from two to four feet per day. The work is under the excellent supervision of Tom McCleavy. The tunnel is now in a distance of 40 feet, the total distance to be run being 2,000 feet. All the work is of the best character. The width of the tunnel is ten feet at the bottom and eight feet at the top.

BUTTE.

Big Blast.—Oroville *Mercury*, Sept. 15: Last Monday the Spring Valley company fired off a big charge of powder. Drifts had been run for weeks under the upper part of Sugar Loaf mountain. Six and a half tons of powder were put in the various "cuts" and drifts, and by means of electricity the whole was fired at once. The bank raised up a little and settled back again, thoroughly pulverized, and ready for the water. This was the largest charge ever fired in this claim, and many a one was on the lookout to see its effects.

Prattville.—From H. B. Abbot we learn that the Gold Stripe mining company have bought his sawmill and are going to remove it from Prattville to their ledge. Mr. Keddie, late superintendent of the Carlhoo mining company, has been succeeded by James Bremen. Alvinza Hayward has lately bought a large quantity of stock in this mine, from which it is supposed that work will be rapidly pushed forward.

CALAVERAS.

Gwin Mine.—Calaveras *Chronicle*, Sept. 16: Very rapid progress is being made in repairing the shaft in the Gwin mine, and it is expected to have the work completed by the last of the month. The mills are forced to lie idle while the repairing is in progress, it being impossible to hoist rock while fixing the shaft. The huge overshot wheel and connecting machinery which is to run the lower or "Alexander" mills, is also nearly completed. Operations will be vigorously pushed when the projected improvements are finished, and the yield of the mine will be greater than ever when milling is again resumed.

Mill to Start.—We understand that it is intended to start the mill at the Lamphear mine as soon as practicable, probably the first of next week. Quite a large quantity of rock from the Quaker City mine has been hauled to the mill for crushing, and quartz has also been struck in the shaft of the Lamphear. Between the two mines it is expected to keep the mill well employed.

Quaker City.—Labor progresses without interruption in the Quaker City mine at the Junction. At present they are cross-cutting the ledge in the 200-ft level and uncovering good ore. Water has been a little troublesome, but that difficulty is now obviated and the mine is being rapidly developed. The prospects of the Quaker City are very favorable.

Gravel Mining Notes.—The mill at the Duryea gravel claim in Chile Gulch is running merrily. Operations are being pushed forward with vigor and activity. Work is going on energetically in Veith's hydraulic in Tunnel ridge, with encouraging results. There isn't a more enthusiastic, indomitable, industrious miner in the State than John Veith. Work is progressing steadily in Emerson's hydraulic, Happy valley. A large force is employed in the mine and a great quantity of gravel is daily put through the flume. At Red Hill, Cook & Co. have struck the blue lead with a good prospect of a large deposit of pay gravel ahead. Cook, Haywood & Co., the Calaveras hydraulioists, are piping steadily. They have an abundance of water and probably will have during the entire season. Harrington & Fagrell Bros. have struck rich gravel in a shaft recently sunk near the old Montgomery claim, in the vicinity of the Calaveras river.

Upper Country Quartz Items.—From West Point we have the following: The new mill at the Josephine is running steadily, but a scarcity of water retards operations somewhat. There is still over 100 tons of ore on the dumps. Carlton's mill is still crushing Champion rock. The grinding will probably be finished the last of this or the first of next week, and a clean-up made. Favorable developments continue to be made at the Mina Rica. We hear that work is shortly to be resumed on the Anderson Flat mine. From Mosquito we have the following: Lewis & Fairchild lately had a lot of rock from their mine crushed in Garland's mill that paid $43 per ton; lucky fellows. Work is progressing at the Glencoe Consolidated, and good rock is being obtained. The locality for the main shaft has not yet been selected.

The Brady Mill in Active Operation.—Tuesday of this week the mill at the Brady mine was started up in real, downright good earnest, and has been in constant operation since. The crusher performs admirably, a large amount of ore being put through the screens daily. We understand that the appearance of the plates indicates that the rock being worked is of good quality, and that the prospects of the mine are flattering. A force of hands is employed in mining rock, and there is no question but that the conduct of operations will be permanent and profitable.

INYO.

Coso Con. Affairs.—Coso *Mining News*, Sept. 12: Mr. S. Linkton, late superintendent of the Coso Con. mining company, has resigned his position, and goes to Nevada to take charge of some mine there. Chas. W. Leach, foreman of the Coso Con., is now acting as superintendent, and W. E. Stronach is acting as clerk for the company.

New Coso Furnace.—L. F. Shepard, who was formerly in charge of the Defiance furnaces, has been placed in charge of the New Coso furnaces. It is hoped, and we believe, that a greater amount of bullion will now be turned out. Stockholders here wonder why the New Coso company are not paying dividends instead of levying assessments. There is no reason why the mine should not, but it don't.

Mill for the Minietta.—James Morton, of Merced City, one of the heavy owners in the Minietta Belle mining company, at Lookout, says that the company will immediately make arrangements for the construction of a 10-stamp mill to work their ores, as it is believed that they can be handled to much more profitable advantage than by the furnace process. The Modoc ores are of the same character to a very large extent.

Kearsarge Mountain Mines.—Coso *Mining News*, Sept. 16: Among the most valuable mines in Inyo county there are some which have received very little attention from the public press, although they are owned and managed by some of the leading capitalists on the coast, and men of integrity and enterprise, otherwise they would not have ventured investments in such out-of-the-way places. We refer to the mines known as the Kearsarge series, situated near Independence, in the Sierra Nevada mountains. It has been our pleasure, during the week, to meet with Mr. A. Wingard, who is connected with the Silver Sprout mine, which is located in the Sierra Nevada at an altitude of about 10,500 feet. The work done upon this mine consists of a tunnel run upon the most depressed portion of the accessible part of the mountain, and is run in a distance of 200 feet, striking the ledge at the depth of 117 feet, and at this point the ledge is 14½ feet in width, bearing quartz which assays from $130 to $1,496. Several shafts have been sunk, to connect with the tunnel, and directly upon ore for the whole distance, and as depth is attained the ore has steadily increased in value. The ore predominates in silver, and carries on an average about one-seventh in gold. At present the company is involved in some litigation.

The Kearsarge, located at an altitude of 9,000 feet, and about one mile east of the Silver Sprout, was located in 1865. A large amount of money was paid in for its development, but, like in a great many other instances, the greater part of the money was misspent, otherwise the Kearsarge would have made a good showing long ago. Some two years ago the mine passed into the hands of other parties, who are now bending their whole energies to a successful prosecution of the work of development. There were formerly two sets of workings, the first run into the mountain some 500 feet above, and called the Cliff mine. Ore taken from the upper workings was taken to Virginia City, where it mined some $1,800 per ton. It was supposed the ore had given out at this point and the lower tunnel was started, 500 feet below. This tunnel is run in nearly 300 feet and a shaft has been sunk in the tunnel about 100 feet, upon the ledge, the size of vein and quality of ore gradually increasing as depth was reached since the winze was started. The ore body at the bottom of this shaft is, by actual measurement, three feet, of solid, high grade milling ore, entirely free from the antimony and refractory ores encountered above, and which will mill at least $300 per ton. It is silver ore, but like the Silver Sprout, carries gold. Next come the series of the Rex Montes mines, consisting of five, and located on the north side of the same mountain, in an opposite direction from the Silver Sprout mines, and at a higher altitude, being about 11,000 feet. The company at present are working but two of the mines.

Emigrant, Lee District.—Coso *Mining News*, Sept. 16: From Mr. John Pattie, an old miner and prospector of 20 years' experience, who visited the Emigrant Co.'s mines some days ago, we have the following report to make: I visited the Cactus mine only, going through all its ramifications, and for the amount of work done a larger and better body of high grade ore is developed than I have ever seen at its present depth, with the exception, perhaps, of the famous Eberhardt, of White Pine, where an ore body is exposed for a length on the vein of some 80 feet, and at least 20 feet wide, of high grade milling ore. How much further this ore body extends cannot be determined without further exploration, but there are all the indications going to show that it extends to a very great distance. What seems most to be desired is a mill directly at the mine for reduction of the ore, instead of transporting the same a distance of eight or nine miles to the present location of the mill. I am satisfied, if the water was brought in and a mill erected at the mines, there is now enough ore in sight to make the Cactus a splendid paying mine.

Miners who came in from Lee yesterday report that a veritable bonanza has been disclosed, within the last day or two, in the Cactus mine, and that at all points the mine looks much better than it ever did. The ore has increased in richness to such an extent that it is an easy matter to melt out the metal on a common shovel, and nearly every one of the boys have made themselves a small silver, brick, to keep as a memento of Lee district. The men on the mine have been taken off for the present, as it is the intention to at once remove the mill from its present locality to the mine. When this is done we may look for such daily shipments of high grade bullion ore by the Emigrant company upon the stages as will rival Ploche in her palmy days.

MENDOCINO.

The Placers.—Mendocino *Dispatch*, Sept. 9: Quite an excitement was created in our streets this week by the arrival of $95 of bright, glittering gold dust, fresh from the Calpella mine, which had been washed out in a rocker by Messrs. Tollman and Phillips. The water was carried from a neighboring spring. The dust was at the drug store of Mr. Hoffman. All our vicinity wants is the completion of those reservoirs and our town will be filled with people.

MARIPOSA.

A Mine not for Sale.—Mariposa *Gazette*, Sept. 16: The famous Hite mine, situated on the South fork of the Merced river, shows no abatement in the stream of treasure which it has been pouring out for years. It is to-day, and perhaps will be for years to come, the most profitable gold bearing quartz mine on the face of the earth. It is worked through a tunnel running in a northerly direction, from near the level of the river, 1,400 feet, where it intersects the main vein. From this point of intersection, levels have been run 500 feet each way, east and west, opening up a vein from 20 to 30 feet thick. A realization of the miser's dream is had in a trip along that wonderful cavern, where free gold and bullion-rock sparkles and glitters and scintillates from every direction. The back or lift which this tunnel gives is so great that we may not for years look to the necessity of any hoisting works. On delivery at the mouth of the tunnel, the ore is sent by means of a double tramway and counter-balancing cars a distance of 1,750 feet, down to the mill, where it is handled by the most approved appliances for gold saving. First, through a patent crusher, or "jaw breaker," then to the batteries, which are eight in number, of five stamps each; then to nine patent concentrators, where the sulphurets are all carefully separated and saved for chlorination; then to the amalgamating pans, and finally stowed away for future generations to get what they may out of it. About 45 tons are thus treated daily, and since the new mill has been running, it has not been found necessary to run every Sunday, so that the boys can have an occasional holiday. The mill is operated by a 125 horse-power turbine wheel, which receives power from the waters of the river. The works are under the skillful management of Mr. W. G. Groves.

The Ferguson Mine.—The Ferguson mine, on the Merced river, above the forks, and nearly opposite Reynolds' Cove, which was some years ago sold to an English company, has come into the possession of a new company, composed partly of the original owners. Under the able superintendence of Mr. Thomas Magee, active operations have been resumed, with a view to reopening the mine on an improved plan. The old works, in which the timbers have gone to decay, are in such bad condition from frequent caving that it has been concluded to run a new tunnel, 400 feet to strike the old tunnel. Five men are already employed upon it, and in the hands of our practical miners we feel assured the work will be vigorously prosecuted to a successful termination.

NEVADA.

Goon Pay.—Grass Valley *Union*, Sept. 13: We understand that Bagley & Hunter's claims, situated on Deer creek, just above Newtown, Rough and Ready township, are paying well. Eight men are employed on the claims, and the report is that last week $800 were taken out—$100 to each hand employed.

Eureka.—*Foothill Tidings*, Sept. 6: The clean-up last week was 325 ounces. Cross-cut No. 3 is in 339 feet, with the ground getting harder.

New York Bill had a crushing of 12 loads of rock this week, which gave a big result—an average of $160 to the load.

Homeward Bound.—North and south drifts in good ground; ledge looking well and of good size. The large pump, which has recently been put in, handles the water with ease.

Empire.—Ledge in No. 11 south is larger, but the ore is of low grade. Ledge in No. 8 south and No. 5 north is a little better quality. Other parts of the mine remain unchanged. Everything running well at mine and mill.

A strike is reported as taking place in a cross-cut of one of our old mines late this week. As it comes to us in the way of a report we can give it only as such, but the source of the rumor leads us to suppose there is something in it.

Machinery from one of our old mines has been purchased by the Godfrey company—sinking for gravel over on Alta hill,—and will be put up as a hoisting and pumping rig at once. The Godfrey people are not down to where they need machinery yet, but expect to be soon, and would be ready in time.

Gold in nice little chunks was recently panned out of the scattered gravel found over near the Union tunnel, on Warner's ranch. The boys interested in that tunnel are justified in concluding that if such prospects can be found in the gravel which was spilled over the rim-rock there should be something good when they drive in through the rock and reach the channel in its lowest bed. The rock through which they are running has of late become softer, so that better progress is being made and all the stockholders feel well.

Rich Ledge.—Grass Valley *Union*, Sept. 19: The Allison Ranch Franklin mine is showing a remarkably rich ledge. A great many "pannings" have been made of quartz taken out, and from $10 to $20 worth of gold to the pan is nothing uncommon. Not a single panning has been made but shows plenty of gold. Drifts are now being run, and the ledge is large and very rich. So far the indications are that the Allison Ranch Franklin is going to beat the old Allison Ranch mine, which produced millions of gold.

PLACER.

Mining Items.—Dutch Flat *Forum*, Sept. 14: In our last issue we inadvertently made an error. We stated that the Polar Star had finished fitting up and that water had been turned on the day previous; we should have said the Southern Cross. The Polar Star has been washing for several months. The Polar Star continues washing during the daytime. A partial clean-up in this claim was made last week with very encouraging results. The Southern Cross had the misfortune of plugging its incline last week, which has not yet been removed. It will probably be cleared in a few days ready for washing. These accident are unavoidable, and are to be expected in opening a new claim through a shaft or incline.

South Yuba Canal.—Mr. A. Hayward, the owner of the two claims mentioned, has recently bought the South Yuba canal, which will afford ample water for washing therein throughout the year. It will be necessary, however, to turn off the water for a few weeks to repair the flumes along the line of the ditch.

The Franklin and Lakamp claims are off making their final clean-up for the season, as is also the claim of the English company at Gold Run.

The Summerset, which has been washing nights only, and the Miami claim at Gold Run are still running, but as the water of the Yuba ditch is soon to be turned off, their washings for this season are drawing to a close.

The Yankee tunnel was advanced 50 feet last week, and the Baker shaft was sunk 10 feet.

Baker Claim.—It is the intention of the superintendent of the Cedar Creek company to have the tunnel completed to this point, the shaft sunk and the claim ready for washing with the first water that comes. He already has a crew of men laying the pipe and doing other work on the surface with this aim in view. This is quite an important measure, as it will enable the company to wash in their rich gravel that has not been drifted out or covered with the barren rock and clay slide encountered in the claims below, and from which it will undoubtedly derive an immense profit.

SAN BENITO.

Rich Strike of Quicksilver.—Hollister *Enterprise*, Sept. 16: We are informed by a gentleman down from San Benito that a regular bonanza of quicksilver ore has been struck at the San Benito mines, 50 miles southeast of Hollister. Last week the workmen struck a large body of rich ore in a tunnel 400 feet deep. They have already run through 12 feet of solid ore, pitching into a high mountain, and it still continues getting wider and richer as they go in. Those mines have been worked for some time past by M. Cody, the principal owner, who showed a world of pluck and perseverance in sticking to it under difficulties, and proving that patience and industry will have their reward. The ledge extends two miles along the San Benito river, and considerable ore has been extracted from shafts and tunnels all along the surface, and over 100 flasks of quicksilver smelted. The present deep tunnel has been run as a test to ascertain if the ledge was going down, and with the above satisfactory result. Those mines will prove a large item in the taxable resources of our county, as well as a benefit to the community generally. We understand that Ed. Breen, of San Juan, has recently become interested in them, and intends commencing immediately to erect the necessary furnaces; and judging from his business energy and ample means, he will make the enterprise a grand success. The owners have our best wishes.

Stayton Mines Sold.—The Stayton quicksilver mines, in the Coast Range, 12 miles northeast of Hollister, have been sold to a company of California capitalists, comprising John H. Moore and S. A. Bishop, San Jose; Wm. M. Lent, John F. Boyd, Wm. Willis and Mr. Harper, of San Francisco. The new proprietors have already commenced operations on the ground. The machinery for two or three large furnaces, costing in the aggregate $10,000, is on the way and hands are employed excavating the foundation for the works, the site of which is at the foot of the principal grade this side of Saytonville. The building of the furnaces will be pushed forward as rapidly as possible, after which the mines, both quicksilver and antimony, will be worked up to their fullest capacity. We have always had faith in the wealth and permanency of these mines, and frequently predicted that they would yet afford employment to hundreds of people and be a source of profit to their owners.

SISKIYOU.

The Empire.—Yreka *Journal*, Sept. 13: John Saxild, Jos. Lang and John D Arcy, who constitute part of the force engaged in opening the Empire quartz mine, near Humbug, report that they have run the new tunnel about 67 feet, and will run about 30 feet further to strike the ledge below the shaft, and thus obtain drainage, as well as a better chance to get out quartz. They found stringers from the main ledge which prospect good, one of them being about three feet thick. The company intend pushing operations towards a thorough prospect, and probably by next spring will put up a quartz mill.

SIERRA.

Keystone.—*Mountain Messenger*, Sept. 16: Superintendent Hughes is just rushing things at the Keystone mine. Since the water decreased so that they could handle it without difficulty, work in all parts of the mine has advanced with great rapidity, and the mill is steadily crushing the golden ore.

Left.—Mr. Frank Harland, for the past four years superintendent of the Sierra Buttes mine, has resigned his position and departed for the lower country. Mr. William Johns, who for a long time has had supervision of Plumas, Eureka and Sierra Buttes mines, is now at the Buttes, but has not, so far as we have learned, made any appointment to fill Mr. Harland's place.

Improvements.—The Bald Mountain mining company, of Forest City, is making extensive improvements. Large timber sheds are being erected, and a large lot of "T" rail is on the way, to be used in relaying the track in the main tunnel. A locomotive is expected about the 1st of October, which it is intended to use for drawing cars from the mine. We also understand that a water-blast is being put in the shaft for the purpose of more thoroughly ventilating the mine.

Adverse.—Adverse claims have been filed in the matter of patents to the Sierra Buttes mines.

Paying.—Good gravel has been struck above Loganville, in the Romany ravine, about 50 cents to the pan. Will take out this season $20,000.

Assessment.—The Iowa company have levied an assessment of $150 per share, and the Bald Mountain extension one and one-half cents per share.

Prospecting.—Two Portuguese prospecting companies at Howard's ravine, near Frenchman's ranch, are doing well. Another company above them are also prospecting.

TRINITY.

Better Prospects.—Trinity *Journal*, Sept. 16: Mr. Burns, the new superintendent of the McGillivray ditch and hydraulic mining company, informs us that some new ground recently opened prospects much better than any heretofore worked, and that the mine is now paying more than running expenses. Inasmuch as the property has been running its owners in debt for some time, the new discovery is very opportune, and will doubtless be fully appreciated by the stockholders.

Nevada.

EUREKA DISTRICT.

The Matamoras.—Eureka *Sentinel*, Sept. 15: The new owners of this valuable mining property have at present 16 men employed in and about their mine on Prospect mountain, building a dump, erecting a boarding-house and at work in the mine. They are pushing things vigorously, and will soon have their property in first-class shape. The mine is looking splendid, new developments being daily made, showing the close proximity of an extensive ore body. The furnace of the company is also giving a good account of itself, and the future of the Matemoras is most encouraging.

WARD DISTRICT.

The Martin White Co.—Cor. White Pine *News*, Sept. 13: The furnaces of the Martin White company started up about the 1st of September, with a good prospect of making a long and successful run. They have three coal kilns already in working order and three more in the course of construction, with a working capacity, when all in working order, of 10,000 bushels. They have contracted with Campton & McGill for 800 bushels per day for the next six months, which will insure running of at least one of the furnaces during that time, barring accidents. It is the intention of the company to run the Paymaster ore with that of the Defiance, in such proportion as will make the bullion average not less than $700 per ton in silver.

The grading for the company's mill, recently purchased by the Troy company, has already been completed, and it will be erected and put running order as soon as possible. There is plenty of ore for it when ready to operate, and a great deal of interest is being felt in its success.

The scarcity of money in the camp is perceptible in every department of business, and it makes things look blue when it is remembered that a long and perhaps severe winter will soon set in. Building for the present has had somewhat of a set-back, owing to the scarcity of lumber.

REESE RIVER DISTRICT.

Reese River Reveille, Sept. 14: Nearly all the miners in Austin now find employment. The Manhattan company employs a large number of them. The mines of Lander hill are reported to look better than ever before, and indications lead to the belief that there is enough high grade ore in sight to justify active operations for many months to come. A stranger perambulating our streets in the daytime would naturally think that Austin is a very dull camp, as few persons can be seen on the sidewalks. The reason of this is that almost every one is busy in the daytime, but when evening comes Main street presents a very lively appearance.

Bartlett Creek.—*Silver State*, Sept. 14: A fine specimen of ore from the Tom Green mine, at Bartlett Creek, has been received by Messrs. Grass & Harding. Two and a quarter tons of ore from the mine worked last week at the Florence mill produced $80 in gold bullion. The ore also contained considerable silver, but the amalgamating department of the mill was not arranged for saving it. The residents of Bartlett Creek express great faith in the future of the camp, and have concluded to stick by it until times mend.

CORNUCOPIA DISTRICT.

Leopard Bullion.—*Silver State*, Sept. 14: Five bars of bullion from the Leopard mine, at Cornucopia, was shipped from Carlin to San Francisco yesterday. From this the inference is that the Leopard mill, which was shut down for repairs the first of the month, is again in full blast.

LEWIS DISTRICT.

Battle Mountain Ore.—*Silver State*, Sept. 14: Two car loads of ore from Battle Mountain arrived at the Humboldt reduction works yesterday to be reduced into bullion. The ore is from Lewis district, and was shipped by J. W. McWilliams.

ELY DISTRICT.

Meadow Valley Mine.—Ploche *Record*, Sept. 12: We are pleased to learn that the machinery for this mine is in a very forward state and that there is no doubt that it will be finished and shipped in time to get it this season. The Risdon iron works are running their full force upon it, and sparing neither time nor money to get it finished. The pumping engine is the largest of the kind ever built, which has necessitated a complete set of new patterns and plans, involving a much longer time than originally contemplated. A somewhat similar style of engine was made by the Risdon iron works company for the Alta mine in Nevada, and which has proved the most successful one on the Comstock lead, and has opened a new era in pumping water. Some idea of the economy in fuel of the Alta engine may be gathered from the fact that a single 48 inch by 16 feet boiler runs easily this engine—27 inch initial cylinder and 40 inch compound cylinder—working a 14 inch pump from a depth of 600 feet, and a hoisting engine, 12x24, sinking at the rate of about 100 feet per month. Engineer Ames, who is superintending the new machinery, promises to beat even this figure. The water will be a god-send to our mills, and in that way more than pay for its pumping. We but reflect the sentiment of the camp when we say that the prospect justifies the outlay and will in the future amply recompense all for the chances they take. Let the ore in the Meadow Valley be sunk on and developed and every claim on the line will spring into life.

WASHOE DISTRICT.

California.—Gold Hill *News*, Sept. 14: Daily yield, 700 tons, from the regular ore sections of the 1500 and 1600-ft levels, which are showing finely as usual in all the ore breasts and stopes. The south drift at the 1600-ft level is in the richest kind of ore, showing improvement over last week. It is now a few feet south of cross-cut No. 4 on the 1500-ft level, making very good progress. Over 800 tons per day are now being hoisted through the C. & C. shaft, and the balance

through tbe Con. Virginia, Ophir and Gonld & Curry shafts. The new mill of tbe company has started into operation, and is crushing ore from the mine. At the 1400-ft level the work of retimbering, cleaning out and repairing of drifts and winzes goes ahead. The regular monthly dividend of $2 per share, aggregating $1,080,000, was declared last Friday. With the assistance of the C. & C. shaft, the hoisting capacity of tbs Oslifornia and Con. Virginia mines is increased to about 2,000 tons per day, which is liable to increase the bullion production considerably.

Con. Virginia.—Ths ore product is being largely increased and the Bscon snd Trench mills sre being started up on ores from tbis mine to-day. The hardness of the rock has retarded work at the 1550-ft station, but its enlargement and retimbering is about completed. The main shaft is in excellent working condition. The ore breasts and stopes are showing splendidly as usual, with numerous dividends in sight. The retimbering of the south drift at the 1400-ft level is progressing well. Tbs new California mill being now in operation, tbs mill of the Con. Virginia is once more crushing Consolidated ore. The C. & C shaft is now down sbout 100 feet below the 1500-ft level, and sinking is rather slow at present, owing to ths continued strong flow of water encountered.

Solid Silver.—Ths old Washoe mins on Cedar bill having been bought by a company of San Francisco capitalists, is now known as tbs Solid Silver, and under tbe new management the mins is being practically developed. It is situated north of ths old Sacramento mins on Cedar bill. The old tunnel, 1,250 feet in length, whicb was run in ths early times, they sre now cleaning out and repairing, and propose cross-cutting from it at various points into ths lead which runs parallel with tbe tunnel. Tbe work is being done under tbe supervision of John Steele, well known as one of tbe most experienced of miners in tbe Cedar Hill section.

Julia.—The drift east at the 1800-ft level is in 175 feet, and advancing at the rate of 40 feet per month, through a soft porphyry and clay formation, with frequent seams of quartz; nothing definite as yet. The soutb drift on tbe same level is in soft ledge matter, abont one-half quartz, and advancing at a very good rate. The water is slacking off considerably.

Gould & Curry.—Cleaning out and repairing the main jlncline below the 1700-ft level preparatory to sinking deeper. The retimbering of the main shaft goes steadily abead; ground soft and troublesome. The excavation for the new surface machinery is completed and tbe masonry foundation being put in.

Aureola.—Sinking the new working shaft is making excellent progress. Have been building a road during tbe week from the Virginia and Truckee railroad to tbe mine, which will bo completed this evening.

Florida.—Excellent progress is being made sinking the main sbaft deeper, to open the 600-ft level. The flow of water from the drifts constantly decreases and is handled with perfect ease by the very ample pumping arrangements, which are inferior to none on the Comstock.

North Con. Virginia.—The new surface works are all complete and properly housed in, the pump connections made, bobs and tanks in the shaft all right, and in the course of a day or two the machinery will be started into practical and regular operation.

Ophir.—Daily yield, 300 tons of ore, principally from the 1600-ft level. All the ore stopes and breasts continue looking and promising well and the cross-cut west, near the Mexican line, is running in low grade ore. Tbe ore deposit east at the 1600 ft level is showing richer than ever, and promises to be an extensive and valuable development.

Bullion.—Owing to the breakage of the pumpengine shaft at the Imperial, allowing the lower levels to be flooded and the air communication sbut off, nothing is being done at present at the 2000-ft level.

Silver Hill.—Sinking the main incline deeper is progressing finely in favorable working ground. No increase of water. Pumping machinery working first-rate.

Cosmopolitan.—The winze below tbe main tunnel or adit is now down 43 feet, in good pay ore all the way, assaying about $25 to the ton, of which but a small proportion is silver, nearly all being gold. Tbe vein is over three feet wide.

West Belcher.—A large amount of excellent pay ore is developed by the upraise above the 300-ft level, as well as by the main working drift at that level. The Vivian mill is to be kept running on ore from tbis mine, and it will be started as it before long. Other mills will also be put to work as fast as required. Plenty of ore on the dump as well as in the mine.

Amazon & Glasgow.—Work in the combination sbaft is discontinued for the present until tbe new machinery is in place. The hoisting tanks control the water, the flow being quite heavy from the ore vein developed at the 400-ft level.

Baltimore ann American Flat.—The station and pump at the 1450-ft level being completed, drifting at that level for the ledge is commenced.

Savage.—Tbe new and powerful pump is working away with the most assiduous industry, and has already reduced the water nearly 100 feet. Tbe incline is found to be somewhat caved and needing repairs.

Imperial Con.—Tbe heavy crank of the pump engine broke short off last Monday, causing a sudden suspension of operations. The hotating tanks were inadequate to the task of getting the water out, consequently it slowly gained and arose until tue 2000-ft level, as well as the winzes and drifts below, were completely submerged. As soon as possible the damage will be repaired.

Dayton.—Good work is being done sinking the main incline and in the development of tbe 700-ft level. At the 500 ft level everything is in good working order and cross-cutting is commenced. The cross-cut at the 300-ft level shows fine looking vein matter in its face and the connections for the new air compressor are being put in.

Wann.—Total deptb of shaft, 600 feet this morning. Material at bottom bard, but blasting and working favorably. Making one set of timbers per day. Water has increased some little.

Hale & Norcross.—Tbe heavy new pumping machinery is working finely and bas reduced the water nearly 100 feet. The main incline is found to be all right, with no caving or any extensive repairs found necessary to be made. The lower levels will be arrived at before long.

Sutro Tunnel.—Total length of tunnel last evening 14,815 feet. Having passed the heavy water fissure mentioned at last report, the face is now in bard, dry material again, composed of hard porphyry, with seams of clay and quartz. It blasts and works well, and tbe Ingersoll drills are doing good work in it.

Chollar-Potosi.—Daily yield, 90 tons, from the old ore producing section. Average assays from car samples, $30 to the ton.

Crown Point.—Daily yield, about 60 tons, keeping the Rhode Island mill running steadily. Main incline down below the 1800-ft station.

Caledonia.—An additional boiler and new gearing have lately been procured, work bas again been started up, and will be prosecuted henceforth with all energy, night and day.

Herald.—Incline still in the same very promising ore strata reported last week. Some of this ore gives very rich assays, and the prospect for developing a fine paying ore body is very good. Present depth of incline, 147 feet.

Mint.—Sinking tbe shaft below the 1200-ft station is resumed under the most favorable auspices, and the 1200-ft station is well opened.

Overman.—Shaft sinking at the usual good rate of progress. North and south drifts at the 1200-ft level both sbowing well in the face; more quartz coming in, streaks of which give low assays.

Baltic Consolidated.—Better and larger streaks of low grade ore are coming in at the face of tbe main west drift, and the nature of the material is soft and easy to work, allowing of a good rate of advancement.

New York.—Ths work of excavating for the pump tanks, and putting the sbaft in order for active business goes ahead livsly with three shifts of hands.

Justice.—Daily yield, 125 tons. The upper ore producing levels are showing more and bettsr ore in the stopes snd breasts, and another mill is to be put on forthwith. The cross-cuts at tbe 800-ft level ars developing and opening out the ore body in good style, and at tbe 1000-ft level ths main drift southward is advancing steadily in good veiu formatiou, ehowing more quartz stringers.

Yellow Jacket.—South drift at the 2040-ft level advancing in porphyry and quartz. Cross-cut east from this drift shows considerable improvement; good streaks of ore coming in which assay well.

Beach & Paxton.—Good prospecting and development work being done at the second and third levels. Some good streaks and bunches of ors are met with in the west drift at the third level.

Mexican.—Northwest drift at the 1465-ft level showing well. It is in fine looking vein matter with bunches and seams of low grade ors, which improve with advancement.

Kossuth.—Cross-cut at the 500-ft level sbowing well, in fine veiu matter, with streaks of good ore.

Alpha.—Owing to the flooding of the Imperial lower levels, nothing is being done at the 2000-ft level.

Best & Belcher.—Main drift south steadily advancing, with its face in fine looking vein matter, principally quartz.

Rock Island.—The tank and pump arrangements have been a success in reducing tbs water which flooded tbe mine, and work at the 850-ft level is being resumed.

Melbourne.—A good seam of promising quartz appears in the bottom of the shaft.

North Carson.—The ore vein developed at tbe 800-ft level is showing finely, and its bullion producing capacities will soon be practically demonstrated.

Globe Con.—Work in the mine is started up, and everything now being in good shade, practical development is the order of the day.

Utah.—Bottom of shaft in favorable sinking ground and no increase of water.

Potosi.—Tbe repairs to tbe main drift being about completed, sinking the winze below the north drift will be resumed forthwith.

Twin Peaks.—The road to the mine will be completed this week, and before next report sinking the new shaft will be resumed.

Superior.—Shaft freed from water and drifting west going ahead from bottom of shaft for the ledge.

Tahoe.—Fine looking stringers of quartz are met with in tho bottom of the shaft.

Belcher.—Daily yield, 350 tons, as usual, the old ore producing sections holding out pretty well.

Niagara.—Rock at tbe bottom of incline a little softer than it was last week. No increase of water.

Prospect.—Drifting west at the 400-ft level at a lively rate toward the ledge. Water decreasing.

Mitchell.—Bottom of winze continues its excellent sbowing of vein matter with streaks of low grade ore.

Continued on Page 212.

Pacific Coast Productions.

At the late Mechanics' fair the *Journal of Commerce* made a display of Pacific coast productions of various kinds. In addition to this there was errenged in the center of the display a revolving octegon, in the sides of which were printed statistical matter relative to commerce and manufactures of San Francisco, products of the coast, etc. Tbese figures will be found of interest end value and we give them below. The list of newspapers that heve had birth in our city is of special interestto meny of our readers, and we accordingly publish it with other statistical tables given.

COMMERCE OF SAN FRANCISCO.

Length of Railroads	1,500 miles.
Imports Merchandise, Foreign and Domestic. 1875	$81,000,000
Exports Merchandise, Foreign and Domestic, 1875	45,000,000
Coin and Bullion Exports	42,358,096
Imports, 27 years	1,208,000,000
Exports of Treasure by Sea, 27 years	1,112,000,000
Exports of Merchandise by Sea, 27 years	400,000,000
Vessels arrived fm Foreign Ports, 1875, 519; Tounage	609,188
Vessels departed to Foreign Ports, 1875, 589; Tounage	702,736
Dry Goods imported 1875	$25,000,000
Lumber received	306,000,000 feet.
Pig Iron imported, 1875	38,534 tons.
All Iron	50,000 tons.
Sugar	51,056,545 lbs.
Coffee	11,651,341 lbs.
Tea	19,872,229 lbs.
Rice	47,995,564 lbs.
Bags	12,550,000
Tinplate	76,695 boxes.
Whisky	13,739 barrels.
Kerosene	1,993,020 gallons.
Hog Products	12,000,000 lbs.
Nails	259,749 kegs.

The Pacific Life, Shaw & Van Aruam, 1876.

Factory Accments.—In England, in the half-year ending the 30th of April, 1876, factory accidents caused the death of 128 persons, namely, 91 men end one woman, 27 young persons (all males except two), and eight male children and one femele child. The eccidents not fatel were serions enough to require amputetion of a limb or part of a limb in 488 instances, but in 403 of these the loss was only of pert of the hend; there were also 260 fractures of limbe or bones, 197 instances of injuries to head or face, end 2,193 other injuries sufficient to prevent a return to work within the next 48 hours. The totel, including the 128 killed, is 3,266 persons injured—2,497 meles end 769 females. Cleaning machinery in motion is described by a subinspector es "continuing to lead to very numerous and peinful mutilations."

Life on the Earth.—Prof. P. G. Tait, of the University of Edinburgh, in his lectnres on recent advences in pbysical scieuce, lately published, considers the qnestion how long life hes been possible on the earth. He concludes that 10,000,000 years is "the utmost that cen be allowed from the physical point of view for all the chenges thet have taken plece on the earth's surface since vegeteble life of the lowest known form was cepable of existing there." Opposed to this is the view of the most eminent modern geologists, that et leest 300,000,000 yeers have passed eway since terrestriel life begen.

Important Improvement in Boiler Construction.—In some of the leading boiler works in Mencbester, England, the longitudinel riveted seems heve been abolished, es ceusing e weakness exactly in thet direction where the greatest strein ceuses an especial danger. The pletes are united by soldering, with the help of a gas furnace and special mechinery, so es to make their length equel to the circumferences of the boiler.

The Engineer.

A Great Work Proposed at Manchester.

Some extensive navigation improvements ar proposed for Manchester, England. Mr. Ham ilton Fulton has projected a scheme for a ship canal from the city to the sea. *Iron* says this is the revivel of an old project in a new and more practical form. Manchester is at present, for custom purposes, a port; but the canals connecting it with the sea vie the Mersey are navigable only by berges. Mr. Fulton would create a direct outlet for large vessels by utilizing the channel of the Irwell. This river flows through the heart of Manchester in a junction with the Mersey. It is proposed to widen the channel from Manchester to Warrington, and to excavate it to a sufficient depth for vessels of 4,000 tons. The Irwell has an extraordinary sinuous course throughout its length, running within a short space towards ell points of the compass. Those corners are to be cut off, so to speak; and, of course, the additional advantage will follow that the channel will be shortened as well as straightened. Nine miles will thus be saved in distance.

From Manchester to Warrington, then, it is proposed to make use of existing waterways, widening, deepening and streightening them, and dispensing altogether with locks. From Warrington, which is on the upper tidal portion of the Mersey, to the feirwey at Liverpool it is proposed to make a direct and permanently defined low water channel, by which the ebb and flow of the tide would be kept to one course. It is calculated that by this means the level of low water mark would be much depressed and the range of tide would be consequently augmented. A greatly increased navigable depth would thereby be obtained, both before and after high water. The low water channel would be formed by constructing, in carefully selected positions, jetties, parallel to its proposed course, so as to guide the current at and about the time of low water in the desired direction. Where the bottom of the channel consists of sand, mud or clay, the scour of the old and flood current is expected to be sufficient to prevent deposit, and also to excavate the bed to the proper depth. When completed, the channel would be buoyed and lighted, so that ships might pass, if necessary, at night.

The time taken in the passage over the canal can only be calculated at present on unoertain data. Mr. Fulton, however, says that ships arriving at Liverpool about three hours before high water might reach Manchester during the same tide, and *vice versa*. The calculation apparently rests on the supposition that steem tugs would be employed to tow sailing vessels up and down. Mr. Fulton's scheme includes the provision of ample wherves and werehouse accommodation at Manchester and Warrington. In Manchester there would be a long line of quay on each side of the river, enabling vessels to lie alongside to load or unload. It is estimated that the minimum depth of the canal at high water neap tides would be 24 feet. The maximum depth of cutting from the level of the proposed quay walls to the present surface of the ground would be 45 feet. The width of the channel between the quey walls at Manchester would be 450 feet, so that there would be room for ships to turn round. The ordinary width of the bottom of the channel would be 72 feet.

The estimated outlay for the construction of the canal is £3,500,000. It is thought that the amount of traffic on the Manchester tidal navigation could not be less than 4,000,000 tons outwards and inwards. An average toll of three-quarter pence per mile, or two shillings a ton for the whole distance, would give £400,000 a year on the 4,000,000 tons. Deducting 33 per cent. as the probable amount of working expenses, there would be £268,000, or nearly 7¾ per cent. on the total estimated outlay.

Boiler Making on the Clyde.

Boiler making on the Clyde, the great shipbuilding center of Great Britain, has arrived at much perfection. *Iron* says that engineering talent, which was formerly directed almost solely to the careful working out of all the details of the engine, having now been applied to corresponding details of boiler construction, the consequence is that boilers are now very generally made upon sound principles. The shell plates are all planed on the edges, and the rivet holes are as a rule punched from a self-acting table worked from the punching machine, thereby insuring the nicest equality of "pitch" of the holes. Drilling is only practised in those cases in which that operation is made a specific condition in the specifications, the Clyde engineers as a body having as yet no great faith in the superiority of drilled rivet holes over those that are punched.

The riveting of these large boiler shells is entirely done by machine, the superiority in every respect of machine riveting over that done by hand being very much more evident now than when boiler plates of three-eighths to seven-sixteenths of an inch were the rule. The machine generally employed is that known as "Cook's patent steam riveting machine," of which Mr. Robert Harvey, of Park Grove iron works, Glasgow, is joint inventor, and he, we believe, all along been the sole maker. It has for a number of years been at work in many parts of the world. There are as many as seven examples of this machine in the works

of one private firm, and they are to be found in the dockyards of the Chinese and various other foreign governments, as also in those of our own country. At present there are nearly 140 made and in use. The machine is usually constructed as a riveter only, but it is also made as a punching, shearing and riveting machine. Great economy in time is the result of using this very substantial, yet ingenious and simple piece of mechanism. In punching, for example, 30 holes, 11-16ths of an inch diameter, through a seven-sixteenth inch plate, can be made in one minute; and shearing can be done quite as easily and exactly as may be desired, the attendant having as complete control over the machine as the tailor has in cutting any textile fabric with his shears. From eight to 10 rivets may be put in and finished in one minute, whereas by hand work from two to three minutes are required to finish a single rivet. Of course the operations which can be performed by the combined machine can only be done one at a time. The closing-up effected by Cook's riveter is remarkably complete and perfect, the solidity of some of the planed sections through the rivets being similar in appearance to solid iron.

The Isthmus Canal.

It appears, from dispatches received during the week from Washington, that there is a prospect of our government joining with the government of Nicaragua to secure a highway between the oceans. We do not know how much of truth there may be in these dispatches, but we give the information for what it may be worth. The Associated Press telegraphs as follows: "The arrival of Don Emelio Genard, the accredited Minister from Nicaragua to this country, is anticipated with some interest by those who have devoted much time and attention to this work. On his return to Washington, negotiations will be entered into by our government and that of Nicaragua looking to the construction of the canal, and treaties will be proposed to the principal foreign powers upon the general basis of the Clayton-Bulwer treaty of 1850, guaranteeing neutrality of the canal, etc. Officers of the government, who have been closely connected with surveys for the ship canal, express the opinion that an undertaking of such magnitude could not be constructed by any private company of individuals, no matter how wealthy and well known, from the fact that many years must be occupied in the work, and it would require a capital of nearly $100,000,000 to complete it. The estimated cost is $65,722,137, but several practical engineers who have examined the route express the opinion that the numerous obstacles to be encountered will increase the cost to nearly the first named sum. At least five years of hard work will be required to complete the canal, and should it be constructed under the contract of the leading governments, it is believed that the work would not be delayed for want of funds to prosecute it. The total length of the canal by the Nicaragua route will be about 61¾ miles. To this is to be added 63 miles of slack-water navigation by way of San Juan river, and 56 miles across Lake Nicaragua. The proposed canal will have 10 locks in its western division, including five locks at Brito, on the Pacific coast, to admit ships at any stage of the tide, each lock having a lift of about ten feet. In the eastern division, between Greytown and the mouth of the San Juan river, seven locks will be required. From the month of the San Carlos river to Lake Nicaragua, the navigation of San Juan river is entirely practicable, with the aid of three short sections of canal, each having one lock."

This is the announcement. The estimate which is placed upon the cost of this Nicaragua route is only one-third as great as the amounts demanded for the building of a canal by the other proposed routes, notwithstanding the fact that it is nearly twice as long. The San Blas route calls for but thirty-five miles of canal, and the line by the river Atrato is similar in length; the cost of either of these lines is placed by Trautwine, the engineer of the Panama railroad in 1850, at three hundred million dollars. These short lines, although they do away with the necessity for locks except at tide water, involve a great deal of tunneling and rock work, which makes their cost almost fabulous. If the Nicaragua route can be proved as cheap as stated in the above dispatch it will of course be the line to follow. We await more information on the subject.

ANOTHER BRIDGE ACROSS THE MISSISSIPPI.—At a meeting of Chicago and Clinton capitalists, at Clinton, Iowa, August 4th, a company was formed to construct a pontoon railway and wagon bridge across the Mississippi, under the act of Congress passed two years ago. The bridge is to be similar to the one at McGregor. There will be $100,000 stock; nearly that amount is already taken. Engineer J. E. Blunt, of Chicago, is engaged to make surveys at once and locate the bridge. It is expected to build it within the next few months. The bridge, besides affording wagon way across the river here, will give the Prophettown branch of the Burlington railway and the Western Union railway entrance to the city, previously denied by the Northwestern railway company, controlling the present bridge.

AMERICAN CREMATION.—A citizen of Washington, Penn., has built a large stone house on a hill for the reception of dead bodies, and a furnace scientifically constructed, in which they are to be burned. He has given strict injunctions to his executors that his own body be burned in the furnace.

GOOD HEALTH.

Dr. W. W. Hall.

Last spring we made a brief mention of the death of Dr. W. W. Hall. He was the founder and editor of *Hall's Journal of Health*, and has, we believe, done more valuable work in instructing the people in the principles of health maintaining than any other writer on hygiene. Our columns have been so frequently enriched by his writings that we have been at considerable pains to secure a portrait for publication, knowing that many of our readers would regard him as an old friend and be gratified to look upon his features. In connection with the portrait we print a sketch of Dr. Hall, published by the *Journal of Health* on the occasion of his death:

During 30 years he had not been ill a day. He had nearly attained his three score and ten years. In spite of a naturally frail physical organization, he might have attained an additional score of years. But few of the readers of the *Journal of Health* had ever seen the man whose name for a quarter of a century was a household word in thousands of intelligent families. Any impressions in regard to the personal appearance of Dr. Hall, based upon his strong and vigorous style as a writer, are likely to be erroneous. In stature he did not exceed five feet and a half, and he was quite slender. In manners he was modest and unobtrusive, of pleasing address, and musical, earnest voice, which added force to his reasoning.

His death was instantaneous, as he had always foretold and desired. That it was occasioned by overwork cannot be doubted. His one and only diesipation was labor. It was no unusual thing for him to labor in his office for 18 hours of the 24. He took little exercise, be-

Truly Yours
W. W. Hall

cause he had, or thought he had, no time to indulge in it. He achieved results because he labored untiringly. His published volumes number about 30, exclusive of the 20 volumes of the *Journal*, which he edited without assistance. He was an able counsellor in matters pertaining to health, but failed to live according to the precepts which he uttered. Like other guide-boards, he pointed the way through pleasant paths in which he never walked.

The writings of Dr. Hall have attained great popularity. His books have sold to the extent of hundreds of thousands, but he regarded the *Journal of Health* as his great life work. It was the first and most successful effort ever made in any country to establish a journal devoted to instructing the people so to live as to attain the largest measure of health and happiness.

Dr. Hall's last book bore the title "How to Live Long," and was a series of maxims, the observance of which on his part would probably have tended to prolong his life for many years. The constant violation of the very laws which he so nobly expounded unquestionably accounts for his sudden taking off.

Dr. Hall had a very extensive acquaintance throughout the country, and his unexpected demise will be widely and sincerely mourned. Upon none will the loss fall more heavily than upon his coadjutors in the management of the *Journal*, upon whom the active labor of its publication long since devolved, and who will continue it in accordance with its founder's frequently expressed wish.

POISONOUS RED CARPETS.—German industry has supplied commerce with carpets of a fiery red color, which owe their beautiful shades to a coloring matter which is known under the name of Vienna lake, rose lake, etc. These carpets are very poisonous, since chemical analysis has demonstrated the presence of arsenious acid; once in the proportion of 1.96 per cent., another time of 2.49 per cent.—*Il Medico di Casa.*

Typhus Communicated by Vaccination.

In the commune of Campamarone there is an institution for young ladies under the charge of the Sisters of Charity, which contains 130 young girls. The girls are divided into three classes—large, medium and small, and these are separated from each other. One of the boarders was recently attacked by variola, and Dr. Parodi, the house physician, thought proper to vacciuate the others to prevent an epidemic. He commenced with the older ones and vaccinated 50. Ten of these were successful. Three weeks later 34 of those who were unsuccessfully vacciuated fell sick at nearly the same time. All were attacked by typhus and three died. The sanitary condition before the epidemic had been excellent, and the regimen was very good.

The virus used was humanized, and Dr. Domenica Bomba, who makes the report, does not doubt that it was the vehicle of the infection. He believes that the 10 successfully vaccinated cases escaped the epidemic because the typhus virus and the vaccine mutually neutralized each other. It was impossible for one of them to make its explosion without annihilating the other.—*La Nuova Liguria and Le Progres Med.*

USEFUL INFORMATION.

To Clean Oil Paintings.

Pettenkofer of Munich discovered the process for cleaning oil pictures, and was rewarded by the king of Bavaria with a gift of 100,000 francs. Wash the picture gently, if it is dirty on the surface, with water and a sponge, and wipe quite dry with a soft cloth. Then take a wad of cotton wool in each hand, one wet with spirits of turpentine and one dry, and gently rub the surface, a bit at a time, with the wet cotton, and dry it with the other, changing the cotton as often as it gets dirty. Then get a box or tray made of wood, or cardboard for very small pictures, a little larger than the stretching frame and about three inches and a half deep, with no cover. On the bottom, inside, place a layer of cotton wool or coarse blotting paper, half an inch thick or less, and fasten it down with tacks or cross-strings, so that it will remain in place when the box is inverted. Lay the picture on the floor or on a table, face upward; saturate the cotton or paper with strong alcohol, making it quite wet, but not so wet as to drip; and then turn the box upside down and place it over the picture. Being a little larger than the picture each way the box will not touch it, but will rest with its edges on the table or floor. The fumes of the alcohol will dissolve the varnish, penetrate through the old coats of it, and clarify the whole. After a quarter of an hour it is well to raise the box a little, and make sure that the paper or cotton does not touch the picture, and that the spirit is not dripping or running down. The box is to be replaced and left for about an hour. When it is lifted off again, if the surface be as soft and even and the varnish as clear as if just applied, the operation is finished. If parts are still rough or clouded, the spirits should be renewed and the box put on again for half an hour or an hour more, and then the picture may be left to dry like any newly varnished one; and may be stood up while drying, as less likely to collect dust.

TO PREVENT DAMP FROM NORTH WALLS.—North walls are frequently damp from the absence of the drying effect of the sun; this defect may however be remedied by allowing ivy to grow over them. It acts both by preventing the access of rain, and by the rootlets absorbing moisture from the wall. In very exposed situations the rain is frequently driven with such violence against the walls, as to penetrate through them, although the brick-work be of considerable thickness. This evil may be obviated by dissolving three-quarters of a pound of mottled soap in one gallon of boiling water, and spreading the hot solution steadily with a brush, over the outer surface of the brick-work, taking care that it does not lather. This is to be allowed to dry 24 hours, when a solution formed of a quarter of a pound of alum dissolved in two gallons of water, is to be applied in a similar manner over the coating of soap. The soap and alum mutually decompose each other, and form an insoluble varnish which the rain is unable to penetrate. The operation should be performed in dry, settled weather.

CHLORINE OF LEAD AS A DEODORIZER.—Dr. Goolden, in the London *Lancet*, directs attention to the great value of chloride of lead as a deodorizer. He prepares it by dissolving half a drachm of nitrate of lead in a pint or more of boiling water, and pouring the solution into a bucketful of water in which two drachms of chloride of sodium have been dissolved. When the sediment has subsided, the clear supernatant fluid is a saturated solution of chloride of lead. Dr. Goolden says that a cloth dipped in this solution, and hung up in a room, will instantly sweeten a fetid atmosphere; or, if the solution be thrown down a sink, water closet, or drain, or over a heap of dung or refuse, a like result will ensue. In this way he disinfected a house in which a drain had burst, some stables, and also a large ship. In the last case the bilge water was exceedingly offensive. He merely dissolved half an ounce of nitrate of lead in a bucket of boiling fresh water and had it thrown down the bilge when the ship was rolling slightly. The effect was the instantaneous disappearance of all smell.

Thoughts about Paint.

A writer in the *Hub* arrives at the following conclusion: Wood is a porous substance, subject to change by atmospheric effects, such as dampness, heat, cold, etc. Paint is designed to protect the wood from these effects, and to improve the appearance of the article painted, by giving it both color and smoothness. To be durable, the first coat should unite with the wood, by grasping, as it were, the fibers, or penetrating into the pores, filling them, thereby sustaining itself and the subsequent coats applied over it, while at the same time it should be composed of materials to make it somewhat pliable, to follow any movement of the wood caused by shrinkage or by jarring or by any other slight disturbance—a quality which might be called elasticity.

The drying of paint is not caused, as many suppose, by the evaporation of its liquids; a portion only of these evaporate, while the oils oxidize—that is, the oils absorb oxygen from the atmosphere, and are converted into gums or resins, binding the particles of pigment together. This transformation of the oils into resins or gums may be hastened by the addition of siccatives or dryers, or by a partial oxidation of the oil by boiling; but just in proportion as this drying quality is given, will the elasticity or toughness of the paint be destroyed.

Boiling oil to partially oxidize it destroys one of its valuable qualities—namely, penetrativeness, and the paint mixed with it consequently has a tendency to dry on the surface of the wood, without entering the pores to secure a permanent foothold.

WATERING PLANTS IN SUNSHINE.—Liebig was the first to discover and prove the presence of nitric acid and of ammonia in the air and the water. From the fact that the contact of atmospheric air, hydrogen and the electric spark produces nitric acid, he inferred that the same process repeated on a large scale by the effect of lightning upon the wet atmosphere—i. e., by every thunder storm—must produce the same result; and the analysis of rain water showed that it really contained a certain amount of nitric acid. The quantity of nitric acid was found to be greater when the experiment was made in the day-time than when made in the night, and a particularly large percentage of the acid was obtained from water which had dripped in full sunshine from the green leaves of a tree. As we all know, a rainfall happening during strong sunshine is considered to be injurious to vegetation, and especially to the development of the green leaves, which often have a stained and seemingly burned appearance afterward. We also know that experienced gardeners, although they can give no theoretical reason for it, discourage the watering of flower-beds during the sunshine. It must be inferred from these facts that the falling rain drops, when shone upon directly by the rays of the sun, exercise a pernicious influence upon vegetation; and we may suppose, although there is as yet no positive proof of it, that the cause of this is the formation of nitric acid in the water. It would be interesting to see in this case, as in many others, a mere empirical observation confirmed by the development of scientific knowledge.

SALT WOOD.—It is a curious fact that in the salt mines of Poland and Hungary the galleries are supported by wooden pillars, which are found to last unimpaired for ages, in consequence of being impregnated with the salt, while pillars of brick and stone, used for the same purpose, crumble away in a short time by the decay of their mortar. It is also found that wooden piles driven into the mud of salt flats and marshes last for an unlimited time, and are used for the foundation of brick and stone edifices; and the practice of docking timber by immersing it for some time in sea water after it has been seasoned, is generally admited to be promotive of its durability. There are some experiments which appear to show that, even after the dry rot has commenced, immersion in salt water effectually checks its progress and preserves the remainder of the timber.

COLORED GLASS FOR ENTOMOLOGICAL CASES.—At a meeting of the Entomological society of Belgium, some time ago, M. Capronnier was charged to make experiments as to the influence of different colors of glass on insect collections; the object being to preserve collections from the decoloration which green and carmine parts especially undergo in daylight. He operated with four tints of glass—yellow, violet, green and blue—also with uncolored glass. It was found that yellow is the best preservative; after 90 days it was the only color which left carmine nearly quite intact. It is not an absolute preservative, for at the end of this time the tint was slightly altered. It seems that the only way known at present of keeping collections absolutely intact is to keep them in darkness.

MIXING DIFFERENT COLORS.—The following recipes will enable the amateur painter to mix many shades or tints that he may require: Cream color—This is a mixture of chrome yellow, the best Venetian red and white lead. Pearl gray—White lead, with equal portions of Prussian blue and lampblack. The blue must be used very cautiously, as it is a powerful color. Fawn color—Burnt sienna, ground very fine, mixed with white lead. Buff—This is a mixture of pale chrome yellow and white lead, tinged with a little Venetian red. Straw—A mixture of pale chrome yellow and white lead. Drab—Raw or burnt umber and white lead, with a little Venetian red.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 mos.	12 mos.
Per line..... .25	.80	$2.00	$5.00
Half inch (1 square)...$1.00	3.00	7.50	24.00
One inch..... 1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:
Saturday Morning, Sept. 23, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Facts About Peat; The Government Building; Hopkins' Improved Rails for Street Railways; Mechanical Ore Concentration and Separation; Extinct Geysers, 201. Ice in the Mines; A Word to the Wise; Calcining Ores; The Centennial; Gems and Precious Stones, 208. The Monnier Process; The Wonders of Wire; Academy of Sciencee, 209. More of the Reese River Mines; Patents and inventions, 212.

ILLUSTRATIONS.—U. S. Exhibition Building, International Exhibition; Dead Chimney of Geysers; Hopkins' Improved Rails for Street Railways, 201. Dr. W. W. Hall, 207. Details of Operation of the Monnier Process, 209.

CORRESPONDENCE.—Summering by the Seaside, 202.

SCIENTIFIC PROGRESS.—Hints for Amateur Obemists; The Damage by Frost; The Irwin-Ainsa Meteorite; Purification of the More Fusible Metals by Filtration, 203.

MECHANICAL PROGRESS.—Hints to Carriage Makers; Foreign Tribute to American Skill; Alarm Signal Apparatus; Loose Rails; Cutting Cold steel with Soft Iron; Telegraphic Improvements; Costly Plate for Japan; Endless Rails, 203.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 204.

MINING SUMMARY from various counties in California, Nevada, Arizona, Idaho, Utah and Montana, 205-6-12.

THE ENGINEER.—A Great Work Proposed at Manchester; Boiler Making on the Clyde; The Isthmus Canal; Another Bridge Across the Mississippi, 206-7.

USEFUL INFORMATION.—To Clean Oil Paintings; To Prevent Damp from North Walls; Chloride of Lead as a Deodorizer; Thoughts about Paint; Watering Plants in Sunshine; Salt Wood; Colored Glass for Entomological Cases; Mixing Different Colors, 207.

GOOD HEALTH.—Dr. W. W. Hall; Poisonous Red Carpets; Typhus Communicated by Vaccination, 207.

MISCELLANEOUS ARTICLES.—Lieu Lands, 202. Pacific Coast Productions; Factory Accidents; Life on the Earth; Important Improvement in Boiler Construction, 206.

CLOSE OF THE MECHANICS' FAIR.—The eleventh industrial exhibition of the Mechanics' Institute closed Saturday night, on which occasion between 12,000 and 15,000 were present. The fair was a success, as the following exhibit given by President Hallidie in his closing address proves. The expenditures of this exhibition are, as close as one can estimate them, as follows: Machinery, $1,200; advertising, $1,600; printing and stationery, $1,350; fitting and furnishing, $3,950; decorations, $2,150; gas and light, $3,700; water, $600; music, $5,150; salaries and wages, $9,300; discount on silver coin, $1,500; expenses, $750; fuel, $500. Total, $31,750. Receipts—tickets and admissions, $51,400; privileges, $6,135. Total, $57,535. This shows a surplus of $25,785, which will be appropriated to pay off the remainder of the debt on the building. The total receipts for the fair, $57,535, are considerably less than the $90,058 taken in 1875, yet from the fact that nothing has to be paid out for premiums this time, almost as much profit is left to the Institute as on the former occasion.

BULLION SHIPMENTS.—The following are the bullion shipments from prominent mines since our last report: California, Sept. 15th, $20,234; Leopard, Sept. 15th, $7,664; Arizona, Sept. 19th, $2,202.24; Northern Belle, Sept. 14th, $9 670.34; Tybo Conn., Sept. 14th, $13,015.37—on September account, $22,185; Leopard, Sept. 18th, $7,547; Northern Belle, Sept. 17th, $16,-054; Ophir, Sept 20th, 13 bars, valued at $46,-530.22.

THE yellow fever does not seem to be decreasing in Savannah.

Ice in Mines.

An item is going the rounds of the press to the effect that in a mine away up in the mountains on this coast ice is found at considerable depth, and that blocks of ice are found all through its underground works. It may not be generally known that this, though not a common circumstance, occurs in certain localities. In one of the pits at Dannemara, (Persberg,) one of the oldest and most celebrated Swedish iron mines, there is a large quantity of ice. The deeper they go the more the ice increases. At some places it is ninety feet thick, forming real glaciers, which are never diminished by any change of external temperature. When the visitor has reached the bottom he is conducted by his guide into vaulted chambers through immense regions of ice. Many of these vaults are so large that fifty men can work in them at one time. The ice has to be raised up in buckets. This fact seems contradictory to the one generally accepted, that the deeper the shafts go the hotter they get. This particular evidence of ice in a deep mine is vouched for by Prof. R. C. von Leonhard, of the University of Heidelberg, who described it a long time since in one of his lectures on geology.

This occurrence of ice in deep mines is not an isolated case. It is found in the pits of Ehrenfriedendorf, in Saxony. Leopold von Buch tells us that formerly, in Norway, mining was prosecuted above the region of eternal snow. Wood for the timbering could not be had there, and its want was supplied by filling up a shaft with water and allowing it to freeze; passages were then cut through the ice as they were needed, the balance of the ice being left in lieu of wood for timbers. It is not explained how the walls were supported while the drifts were being run.

The mines of Rauris, in Upper Austria, are entirely within the glacial region, and most of the shafts open in eternal ice, clear as crystal; the miners' huts are surrounded with ice. On what is known as Gold mountain, one of the shafts was sunk 100 feet through pure glacier ice. A gold mine in the deep valley of the Alps, near Saltzberg, is the highest in Europe being worked. There are two tunnels near this mine, entirely surrounded with glacier ice. It is stated by one authority that there is a locality, deep within one of the iron mines of Dannemara, already noted, where the wall of ice is 120 yards deep.

Calcining Ores.

James C. Duffy, of this city, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improved process for roasting, smelting and calcining ores, a notice of which will be of interest to the mining community. The invention consists in saturating or intermixing with the ores to be treated, petroleum or other highly combustible oil, and then placing the ores in a suitable furnace and setting fire to the mass so that the heat generated by the combustion of the oil will roast, smelt or calcine the ore.

Usually the ore will require to be pulverized before being intermixed with the oil, but where it is porous and friable, it will absorb sufficient oil for the purpose and the pulverization can be dispensed with.

This process is intended to be specially applicable for treating cinnabar and sulphur ores from which it is desired to remove the valuable portion in the shape of fumes, but the inventor says he is able to treat all classes of ore in the same way and not only save the expense of the fuel used, but can also attain better results, as the oil will penetrate and reach every particle of the ore so that the roasting will be more thoroughly accomplished.

AMERICAN METRIC BUREAU.—There has been recently incorporated in Boston an association of teachers and others interested in the introduction of the metric weights and measures, under the name of the American Metric Bureau. Article II of its constitution reads as follows: "The object of this bureau shall be to disseminate information concerning the metric system; to urge its early adoption; and to bring about actual introductions wherever practicable. To this end it will secure the delivery of addresses; publish articles; circulate books, pamphlets and charts; distribute scales and measures; introduce the practical teaching of the system in schools; and in all proper ways, as far as the means at its disposal will allow, the bureau will urge the matter upon the attention of the American people till they shall join the rest of the world in the exclusive use of the international decimal weights and measures." This bureau already includes among its members many prominent educators, and its numbers are rapidly increasing. An office has been opened at 13 Tremont place, Boston, and as soon as suitable arrangements can be made, branch offices are to be opened in New York, Philadelphia, Chicago, and other central localities, where all persons interested are invited to call or to write freely in regard to any matter pertaining to the work of the bureau.

THE troops have had a brush with the Sioux, surprised 40 lodges and scattered the Indians.

A Word to the Wise.

The long winter nights will soon be coming on, when every person will have more or less spare time, and when those who are unemployed will seek either the bar-room, the saloon, or the fireside of home to find amusement. In the first two cases that time will be thrown away; in the latter, although a yellow covered novel or entertaining game may serve to while away the time, no traces of good will be left behind, but rather create an appetite for that which tends to enervate the entire mental system, and render it unfit for higher purposes. The great want of our miners and mechanics is a paper which will not only serve to interest but to instruct. Such a paper we offer in the MINING AND SCIENTIFIC PRESS. No other paper on the Pacific coast contains so great an amount of valuable information as the PRESS. From its pages the progress, not only of the Pacific coast, but in a measure the entire country, may be traced. It is an encyclopedia of every day instruction to the workingman and the student. If a reader only gets one new idea of value a week from its pages, this will soon amount to quite a stock of information, from which the mind may branch out and gather new and enlarged ideas, such as will form a solid foundation for an immense structure. This will apply to old as well as young, and time which might otherwise go to waste will be used to lay up knowledge that will often aid in the workshops, in the mines and in every day conversation.

Many a genius lies buried in little blacksmith and other shops, or on the hillsides and in the gulches of our wide land. No man has any business to be stumbling along, working at anything, without making efforts to improve his usefulness and sphere of action. All are behind the times unless they keep themselves posted with the important inventions of mechanics and science. There should be no kind of reading more attractive, especially to the young man of progressive ideas, than a scientific and mechanical journal. It may be the first stepping stone that will lift him to eminence in his trade or profession; it certainly can never do him any manner of harm and will never make him any poorer.

The Centennial.

We have been giving our readers, from week to week, quite full descriptions of the several features of the great exposition. Apart from matters of description, the news from Philadelphia is that since the cool weather has begun there has been a marked improvement in the attendance and the daily receipts have considerably increased. Great numbers of people have waited for this more braving weather to enable them to endure the journey and the tramping. Others, and of this class the farmers of the country form the larger part, have waited until the harvest was gathered. The prospect now is that the closing weeks of the exposition will be its best weeks. The announced time of closing is the 10th of November, so that there yet remain about seven weeks of open show. In this connection we are informed that the fare for the round trip, from San Francisco to Philadelphia and return, has been reduced to $246.80. This is a reduction of about $20 on the trip, for which the public are indebted to the roads east of Omaha. The concession will aid those who make the trip to bear the expense of tarrying at Philadelphia. We think it is not too late to enjoy and profit by the Centennial. Let those go who can; it is the occasion of a lifetime.

THE STATE FAIR.—The event of the week is the fair at Sacramento. As we go to press to day, Thursday, the exhibition is at its hight. We shall be obliged to defer a review of the occasion until next week, when we expect to note the interesting features fully. We learn, however, from the telegraph and the local papers, that the fair is progressing finely with all the accompaniments of a throng of people and a full field and pavilion of exhibits. The fair season of the agricultural regions is now fully inaugurated, and the weeks hence until the middle of October will shine on the fair goers. We wish the exhibitions all success, for we believe fairs rightly encouraged are a power for the spread of agricultural knowledge, for the excitement of laudable competition among producers and valuable as promoters of social enjoyment. We would like to meet our readers at all their fairs and note the features of their progress. But this will be impossible, and we shall trust our correspondents will be on the alert for us at the fairs, as they are in their homes and fields.

THE Helena *Independent* says that 8,222 ounces of silver bullion, valued at about $10,-000, was the product of the last run of the Hope company's mill at Phillipsburg.

THE return tide has set in from the Black hills. Quite a large party of old mountaineers arrived at the Crow agency last week, direct from Deadwood.

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

P. Adularia, Amazon Stone, Labradorite, Lapis Lazuli, Hauyne, Moonstone and Obsidian.

Adulsria, amszon stone, labradorite, lapis lazuli, hsnyne, moonstone and obsidian are similar in their composition, and may be classed with feldspar. It msy be ssid that they are all silicates of alumina, lime, iron, and either soda or potasb, or both. Other substsnces in varying quantities sometimes are found in different specimens or species.

Adulsria is a variety of orthoclase feldspar, transparent, cleavsble, and showing a play of colors. It is sometimes crystallized. When cut and polished it throws out greenish and blueish white pearly reflections. Its specific gravity is 2.5. Hardness, 6.5. Moonstone, a vsriety of adulsria, is white with pearly reflections, thought to resemble the light of the moon.

Both of these varieties make beautiful jewelry when found in pieces sufficiently large. They sre generally aet in blsck, which shows their color to the best sdvantsge. Adularia takes its name from "Adula" the ancient uame of St. Gothard, where the finest specimens occnr. Adularia and moonstone occur in many locslities, both in Europe and the United States, but fine specimens sre of rare occurence.

The best moonstone comes from Ceylon. The following is an analysis of a specimen from that locality: Silica, 64.00; slumina, 19.43; lime, .42; potash, 14.81; magnesia, .29; water, 1.14 =100.

Amazon stone, or green feldspar, came originslly from Siberis. Lately very fine crystals have been found in abundsnce near Pike's Peak, Colorado. This mineral is used for the common sorts of jewelry, and for snuff-boxes. vases, buttons, and similar uses. Its specific gravity is 2.581. Hardness, 6 to 6 5. Like ordinary feldspsr it fnses with difficulty, only on the edges. With borsx it forms a transparent glaas. In a bead of microcosmic sslt a skeleton of silica swims undissolved. Green dioptaze resembles amszon stone, but is scratched by it, by which difference it may be distinguished.

Labradorite, or Labrador feldspar, is nnt strictly a feldspsr, but is sometimes classed with it. This mineral is found as a constituent of some rocks. Dolerite is a compound of labradorite and pyroxene, generslly with some magnetite. Basslt has the ssme composition with the addition of cbrysolite. Lsbradorite is found abundantly in the lavas of Etna and Vesuvius. Many localities might be named, both in Europe and America, and other parts of the world. The following anslysis is one of forty published in Dana's Minerology, no two of which are exactly alike: Silica, 55.75; slumina, 26.50; sesquioxide of iron, 1.25; lime, 11.00; soda, 4.00; water, .50 = 99.00.

Labrsdorite crystallizes in the triolinio system. Hsrdness, 6; specific gravity, 2 6 to 2.76; luster, pearly; color, gray, brown, greenish, sometimes colorless, variable, showing change of colors; streak uncolored, translucent, subtransparent. B. B. fusible to a colorless glass.

When cut and polished labradorite is very beautiful, showing red snd yellow changeable colors when held in different positions in the light. This play of colors is supposed to be caused by fissures. It is not a high-priced mineral. Good specimens can be purchased for three or four dollars each.

Lapis lazuli is a blue mineral much used for ornamental purposes. It is seldom found in crystals, but when crystallizsd it is in the isometric system. It is a silicate of lime, soda and alumina, with a sulphide of iron and sodium mechanically mixed. The following is an analysis by Klaproth: Silica, 46; sulphuric acid, 4; alumina, 14.5; peroxide iron, 3; lime, 17.5; csrbonic acid, 10; water, 2 =97 0. Hardness 5.55; specific gravity, 2.38 to 2 45; luster, vitreous; color, azure blue or violet blue, sometimes red or green, also colorless, translucent, opaque. B. B. in closed tube gives water; fuses easily to a white glass. Decomposed by muriatic acid with separation of gelatinous silics, sulphureted hydrogen at the same time being given off.

Lapis lazuli is found in granite and in calcareous rocks. The best specimens come from Persia; good specimens are found also in China, and an inferior variety in Chile. Deep colored pieces are most esteemed. The mineral is more used for ornsmental purposes than for jewelry. Formerly it was much used as a pigment, under the name of ultramarine, and being the only permanent blue color known, it commanded a very high price. The same color is now produced chemically of better quality snd very cheaply. In China and India lapis lazuli is carved into cups, vases, etc. In a Russian palace there is a room entirely covered with veneers of lapis lazuli and amber.

The name of this mineral is probably derived from the arabic word, "azul," signifying blue. The value of the finest deep colored specimens varies from $2 50 to $15.00 per ounce, according to size.

THE *Hassler*, which got away from the navy yard on Thursday, will resume the survey of Santa Monica bay; afterward the surveys of Santa Rosa and San Miguel islands will be undertaken.

The Monnier Process.

The Mounier process has lately been introduced iu Nevada county, in this State, and considarahle interest is manifested in it. This process has heen heratofore introduced at a number of establishments with considerahle success, so that it is no experiment. We gave a detailed description of tha process shout a year since from tha pen of Mr. Samuel Purnall, of this city, and as saveral enquiries have haan made concerning it racently, give space to consideration of it agsin. It was originally intended principally for working oopper ores, hut is adaptad tu the treatment of a wide range of ores.

The Monnier process consists, suhstantially, as follows: 1. Calcination of the metallic sulphides with a portion of sulphate of soda, or other similar salt. 2. Lixiviation of the calcined ore. 3. Evaporation and crystallization of the sulphates. 4. Reduction of tha sulphata of coppar. 5. Smalting into inget copper. 6. Amalgamation of suy gold residuum. Tha working details ara snhstantially as follows:

Tha ore is mixad with sulphate of soda and crnshed fine enough to paes through a No. 24 screan. It is next roast•d in a muffle furnace or a revolving oylinder furnace; the sulphur will hegin to hurn withiu au hour after the introduction of tha ore, aud aftar that tima hut little fuel is naedad until toward the end of the roasting. Snlphuric ecid is formed hy the oxidation of part of tha sulphur, while the largar proportion of tha sulphur escapes as sulphnrous acid. The iron, coppar and silver are converted hy the sulphuric acid into sulphates, and tha aulphate of soda into a hi-sulphate. Soon all the sulphur not comhinad with the aoda or metallic oxidea is expelled. A low red heat ia now reached, end tha snlphatas of iron and copper suffar decomposition. The sulphuric acid at firet combined in this form has haen stored up, and is now evolved hy the graater heat. Beiug nascant, its combining power is of intense activity aud force, and it attacks any and all metallic oxides or sulphidas remaiuing uncomhined, couverting them with great rapidity into sulphates. Tha coppar and silver preseut are soon converted into soluhla sulphates, iron oxida aud gold ramaiuing uuconverted and insolnhla. In this latter stage of the roasting the value of the sulphate of soda hecomas apparant; it holds fast to the excess of sulphuric acid formad during the early stage, and carries it on to this critical point. While hy other methods of roasting to sulphates, only a portion of the matals are ratained as sulphates aud tha halauce is reduced to an insoluble form, hy this method the acid is retaiuad until required hy tha copper and silver, when it is givan up at the right time, and those metals are recovered with graat ease. If the saving of tha sulphuric acid evolvad should ha of consequence, tha gasas from the furnace may he led into tha usual lead chambers.

Tha roasted ora is next placed in tanks and lixiviated with cold water. The use of hot watar is to ha avoided, as it would dissolve a greater quantity of hase metal sulphatas, notably thoee of lead and autimony. The leaching watar, highly charged with copper, silvar and soda sulphates, is conducted into tanks coutainiug cement coppar, on which the silver is pracipitated in a metallic form as cament silver, whauce it may ha racovered hy tha usual methods.

The large amount of sulphate of soda prasent in the liquor must uow he recovered and regeneratad for futnre oparations. To effact this, the solution is run into crystallizing tanks, and lelt for several days, whan most of tha soda will cryetalliza out. Sae Figure 1. Tha crystallization is interrupted before the sulphate of oopper hegins to deposit; and the solution is run into an evaporating furnace. Saa Figure 2. In this, the haarth is a wooden box lined with laad; *a* is the flue. This is only moderately heated. It receives a staady supply of liquor to maintain a constant laval. In this furnaca tha sulphates of soda and copper as they crystallize are raked out, whila the final charge is avaporated to dryuaes. Soma 60 per cent. of the sulphata of soda originally present is obtained from the first crystallization, which, as soon as it is drained and dried, is ready to go the round again. The 40 per cant. halance is not loet, but is recovered in a following operation.

Tha dry sulphates of coppar and soda ara naxt mixad with charcoal and haated in a reverharatory furnace. As soon as fluidity is attained, sulphurous acid is evolved. The mixture is gradually haatad to reduass, at which temparature it is kept until all the sulphurous acid is expelled. The sulphate of soda remsins undecompesad, and the sulphate of oopper is converted into mixture of red oxide and metallic copper.

The calcined mixture, when cold, is washed in a tank of water, whera the nnhurned coal end soda are easily separated. Tha soda heing again in solution may be run into a crystallizar and completely recovered. Tha copper is now ready for the refining furnace, which refining does not differ from the ordinary proces, Figura 0. In this engraving, *A* repreeants tha ore; *B*, Blake crusher; *C*, cyliuder ore drier; *D*, stamps; *EE*, Bruckner cylinders; *F*, lixiviator; *G*, crystellizer; *H*, evaporating reverharatory furnace, end view; *I*, washing tank; *K*, reducing furnaca.

The plant of tha Mouuiar process costs hut little. For complex oopper oras probahly no establishmant could ha huilt on auy othar plan with a less amount of capital. About a week is required for the passaga of tha ore and prodnots through the various operations. It is estimated that inget copper can he prodnced in a works of this natnra from a tan par cent. ora for five cents per pouud; which is considerahly cheapar thau hy the English or Germau plans of fusion. Very little skilled lahor is requirad. Tha use of matallic iron for tha pracipitation of tha oopper is avoidad hy the usa of sulphate of soda aud tha mathod of raducing the sulphate of oopper. The soda is usad continually with hut little loss. Waar aud tear ara very small, as only low heats are required. Tha procass enables all the valuable matals in tha ore to ha extractad, while tha sulphur can he ocuvartad into sulphuric acid. Tha concautration of poor ores is not so obligatory as in tha fusiou processes and poorar oras can ha worked. During tha roasting it is prohahle that a douhla salt of soda aud coppar is formed, which helps to kaep tha copper in a soluble form. The washed copper has almost tha exact appearanca and richness of cemant copper precipitated hy metallic iron, and undergoes the same spacies of refiniug. Tha actual consumption of soda doas not excead one par cant. for each oparation. Tha loss of coppar is not more than five per cant., and may he aven lees with good managamant.

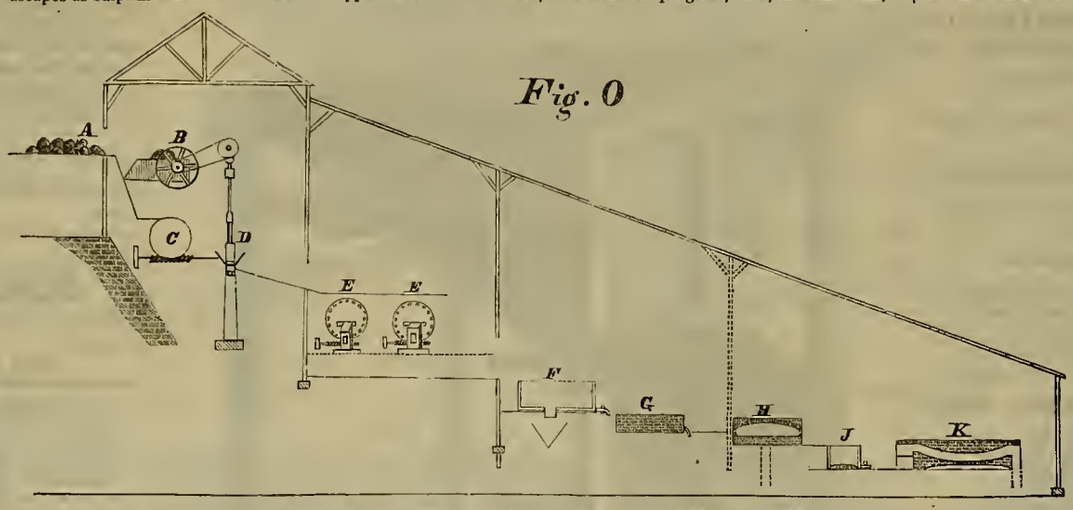

Fig. 0

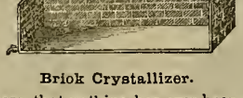
DETAILS OF OPERATION OF THE MONNIER PROCESS.

A weak point in the Mounier process, as well as in some othars, is that it requiras considerable fual to evaporate its solutions, and in a country where fuel is high priced and inferior thst may he a serious disadvsntage. But, how evar that may he, it is prohahla that whare tha ores are rich enough to hear heneficiation hy any process, that nothiug has ever heen discovered which will do its work cheapar and cleaner thau the procass of Monnier, just described. It savas the silver and copper as well as the gold that may be in the snlphurets. At the Providence mine, in Navada county, it is applied specially for working the sulphurets. We hava had no opportunity of laaruing what changes thay may have introduced there for their special object, hut the full process is as described above.

Fig. 1.



Brick Crystallizer.

Sovereigns of Industry.—There has hean organizad in this city a council of the order of Sovereigns of Industry. Tha *Alta* says of it: Ganeral A. M. Winn and 14 othars made tha application for charter last May, aud the organizatiou was consummated under tha direction of Jamas C. Lawis, National Deputy. The following officers ware alactod: J. Earl, Mauager of tha Immigration Bureau, Prasidant; Hou. Charlas C. Terrill, Vice Prasident; Ganeral A. M. Winn, Secratary; Colonal C. H. Denison, Traasurer; John A. Steinbach, Staward; P. S. MacGowu, Lacturer; R. G. Lewis, Inner Guard; John Thompson, Outer Guard. The Executiva Committae are: Prasident J. Earl, Joseph Carrol, Amos Adams, Monroa Miller and James W. Duncan. The Council will meat at the sanata ohamber of United Machanics, 603 Washington streat, evary Thursday aveniug at half past sevan o'clock.

The Wonders of Wire.

It is hardly hyperholical to affirm that the simple metallic thread or filamant familiarly knowu to us as wira, epitomizes the antire culture and prograss of the aga, and that there is no othar single form of the useful metals so intimately inwrought with civilized man's needs.

Nay, if wa wera raquired to indicate soma particular artiole of man's handiwork which should, ahova all othars, in itself reprasant the matarial and morsl power of our present civilization, we should at ouca name that littla piece of pointed perforatad wira—tha sawing needle.

Aud hardly inferior to this in the category of most important trifles made of wire, which ara quite indispensahle to mankind—or, shall wa say, womankind—may he classed the hairpiu. If, as is indisputably and poetically affirmed, "Beauty draws us with a siugle hair," what ongineer so reckless as to estimate tha power of tha hairpiu?

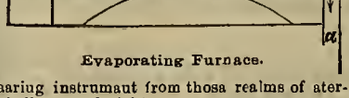
A keeu appreciation of tha magnitude of littla things would douhtlass dawn upon us if we could only foresae what family perturhatiou, what parsonal diecomfort, what a taxing of man's ingenuity for a suhstitute, what an overturning of presant fashions, paradventure, —what dira possihilities of change aven in our whole social structura might the sudden daprivation of that uhiquitous piace of hent wire antail!

If we seem to axaggarate the importsnca of wira iu the world's economy, let us ask in what department of the mechanic arts, of scientific and industrial progress, wire, in soma form, is *not* a valuahle adjunct or an indispansahle requisite?

Tha usas and importsnce of wire are, however, made ohvious in the greater achievements of man.

The intelligence flashad from continent to continent tha wide world around, must hava tha wire track to follow; if we span the Niagaran chasm, the wire cahla is the potential means; or, if scienca, intant on hydrographic research, desires to invastigate tha physical conditions of ocan's profoundest depths, tha wira line alone insuras the return of the evidence-haaring instrumaut from thosa realms of eternal silence and night.

Fig. 2.



Evaporating Furnace.

All-important, too, is wire to the miuer in his explorations of the earth's crust for mineral wealth. The inestimahle treasures of coal and the useful metals, and our monthly millions of gold and silver are drawn from the deepest rocky crypts by the stroug, tenacious siuews of wire—which have now fairly supplanted the hempen strands of old.

Wire also ministers in no small degree to our physical comfort and enjoyment of lifa, as witness the wira broiler, whareon our steaks and chops ara made delicious and digastihla, and the fabrics snd davicas of wira to exclude or antrap the pasts of the household.

We may not evan dehar from the catalogua of human inventions and discoveries iudahtad to wire those two greatest agencies of modern material progress—the railway and steamship—for, without much stretch of faucy, may we not consider the iron rail, tha axle and tha ponderous steamship shaft marely Brobdignagian wires wrought to special and convenient size and shape?

To the credit of tha Pacific coast and tha anterprising proprietor, it may ha statad that all of the alegant workmanship in wire at tha late Mechanics' fair was exclusively of *home manufacture*, mada at the California wire works, of which Mr. A. S. Hallidia is proprietor, and successor to J. M. Eckfeldt & Co.; office aud salesrooms, 412 Clay street.

Academy of Sciences.

The regular maeting of the California Acsdamy of Sciances was hald on Monday eveniug last, Dr. Stout in the ohair. Among the donatious to the library wera a number of hooks from A. L. Pinart, member of many sciantific societias in Europe, who presented fiva volumas of great ethuological and philosophical interest. Mr. Piuart was a visitor to this coast, with sciantific objects, in 1870 72, and again in 1875, and he conductad very patient iuvestigations in natural history, etc., from Mexico to Alaska, and in Arizona and other Territorias of the Uuited States. The whole of the works forwarded hy M. Pinart to the Academy ralate to the Alaska ragion. Thay ara the first pendarous instalmants of a graat project. One of tha volumas, with a nnmber of very beautiful plates, is entitlad "Voyagas to the Northwast Coast of America, mada in 1870-72," and treats of natural history. Three of the other volumes ara contribntions to a "Library of American Linguistics and Ethnographs." They embrace monogrephs hy M. Pettitot on the ahoriginas; a Frauch end Indian laxicon of a numbar of tribes around the mouths of the Mackanzie and Anderson rivers; aud a laxicon of the Esquimsux language. In tha fifth volume M. Piuart deecribes the cavern of Aknanh, on tha island of Oungn, aud a collection of ramarkahle native maske, ornsments and implemente discovered therein, all of which have heen angrevad aud colorad with exquisita fiuish. Dr. Stout stated that the whole of the works hava heen puhlished hy M Piuart, who is tha son of a wealthy iron-mestar in France, at his own expeuse. On motiou of Dr. Kellogg, seconded hy Mr. Dameron, the Academy passed a special vote of thauks to the distiuguished travalar.

From a collection of plants made in Fresno county hy A. G. Eisen, a Swedieh naturalist, Dr. Kellogg gave hrief dascriptions of half a dozen or more new species.

Mr. W. G. W. Harford commuuicated information on some spacies of sessile-eyad orustacea, ohtainad hy Mr. Fisher on the western coast of Lower Califlornia.

A paper "On the Detarmiuation of the Constant *g*," hy E. Dyer, was read hy tha Secretary.

Mr. Guerin offered some ramarks on the suhject of safety in water pipes. The suhjact of the proper thickness of watar pipes will he discussed at the next meeting of the Acadamy.

Progress of the East River Bridge.—We report, says the *Manufacturer and Builder*, that we had tha pleasura of witnessing the sncoassful stretching of tha first steel rope connacting the towers of the East river hridge, which was done amid tha hoistiug of flags, the hoomiug of cannon and the chearing of the people who happened to ha prasant. Tha middla of tha rope at the Brooklyn anchorsge was passad over a system of wheels, the two euds passed over the top of the towar, and at its hase wound upon two drums, placed on a scow, which was towad to the New York side aarly in the morning, while the rope was payed out to the hottom of the rivar, the euds passed ovar the top of the New York tower and attachad to a drum situated helow and ravolvad hy a steam engine. At 11 A. M., when no veesels or staamboats were naar anough to interfere, the cahle was wound upon the drum and tha slack takan up, the cable rising out of the water more rapidly than we oen state tha fact, and in a few seconds swung at a hight of nasrly 200 faat above the water; the other end was treated in the sama way in tha afternoon. Thay rest on pullays on the top of the towar, and togethar will form a kind of eudless belt, moved by the machinery at tha Brooklyn anchorage raferred to ahova, aud serva to conyey the euds of all the othar wiras from one tower to tha other. This movahla cahla is mada of twistad strands of No. 7 chroma steal wire, thrae quartars of an inch thick aud 9,000 feet long, stretching from ona anchorage to tha other over the tops of the towars, across tha rivar and hack again.

A freight traiu on the C. P. R. R. fall off the trestle work near Bantas on Monday last, wrecking 13 oars and killiug two persons. The accident was causad by tha dropping down ou tha track of a braka beam, damaging the trestle and track to a considerahla extent.

The Agent of tha Press who recently visited San Mateo county is now off our list.

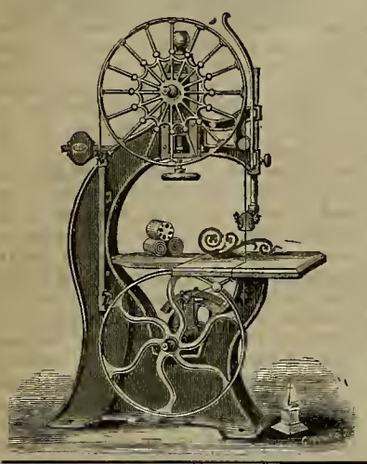
The State Educational Convention met in San Francisco this week.

The Jewish New Year was oelahrated on Tuesday last.

PACIFIC MACHINERY DEPOT,

H. P. GREGORY & Co., Nos. 14 & 16 First Street,

P. O. Box 168. **San Francisco, Cal.**



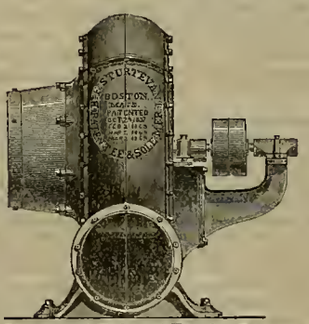
SOLE AGENT FOR THE PACIFIC COAST FOR

J. A. Fay & Co's Wood-working Machinery,

Blake's Patent Steam Pumps,

Tanite Co's Emery Wheels and Machinery,

Fitchburg Machine Co's Machinists' Tools,



Sturtevant Exhaust Fan for Removing Shavings and Sawdust from Machines.

Sturtevant's Blowers and Exhaust Fans,

J. A. Roebling's Sons Wire Rope,

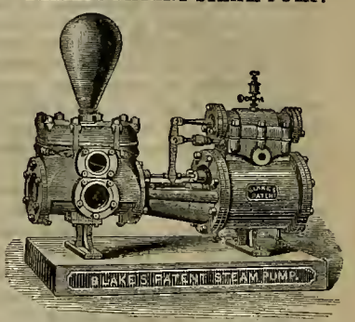
Pure Oak Tanned Leather Belting,

Perin's French Band Saw Blades,

Planer Knives,

Nathan & Dreyfus' Glass Oilers, and Mill and Mining Supplies of all Kinds.

BLAKE'S PATENT STEAM PUMP.



Over 8,500 in Successful Use in the United States.

Metallurgy and Ores.

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS

Chemical Apparatus and Chemicals, Druggists Glassware and Sundries, etc.

512 and 518 Washington street, SAN FRANCISCO

We would call the special attention of Assayers Chemists, Mining Companies, Milling Companies Prospectors, etc., to our large and well adapted stock

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains Grammes, will be sent free upon application.

7v25-tf JOHN TAYLOR & CO.

Nevada Metallurgical Works,

21 First street, 3 doors from Market, S. F.

Ores worked by any process.
Ores sampled.
Assaying in all its branches.
Analysis of Ores, Minerals, Wsters, etc.
Working tests made.
Plans furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines; plans snd reports furnished.

E. HUHN,
C. A. LUCKHARDT,
Mining Engineers and Metallurgists.

LEOPOLD KUH,
(Formerly of the U. S. Branch Mint, S. F.)
Assayer and Metallurgical CHEMIST,
No. 611 Commercial Street,
(Opposite the U. S. Branch Mint,
SAN FRANCISCO CAL. 7v21-3m

Instructions in Assaying,

Chemical Analysis, Determination of Minerals, and use of the Blow-pipe.

HENRY G. HANKS

Will receive a few pupils at his new laboratory, 617 Montgomery street, up-stairs. TERMS MODERATE

RODGERS, MEYER & CO.,

ASSAYERS and METALLURGISTS,
10 STEVENSON STREET, S. F.

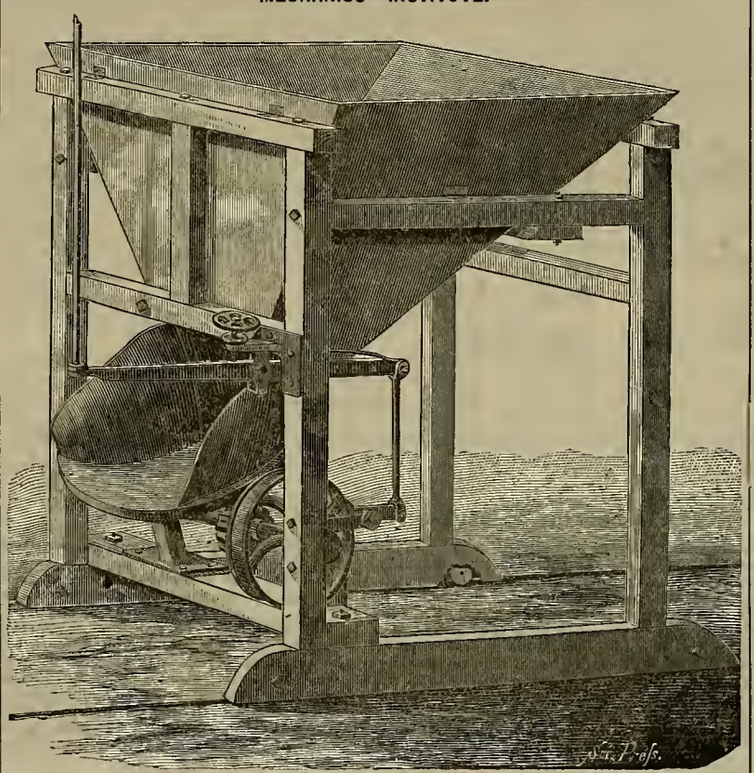
ANGELL'S CHARCOAL DENTAL SOAP for Whitening and Preserving the Teeth. J. W. ANGELL, Prop., San Francisco

$55 to $77 a Week to Agents. Samples FREE. P. O. VICKERY, Augusta, Maine.

$1,000 CHALLENGE ORE FEEDER,

HENDY & COCHRANE'S PATENT,

AWAROED FIRST PREMIUM AT THE TENTH INDUSTRIAL FAIR OF THE MECHANICS' INSTITUTE.



It may be considered as now fully demonstrated, by careful and long-continned experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must he evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply *dropped*. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says, of the Table Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them."——A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them.——Two of the machines were shipped to the Bunker Hill Mill, Amador County.——Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen.——Mr. Lachman, of the Soulsby Mill, Tuolumne County, says they work splendid; could not do better.——Two of the machines were shipped to the California Company, Nevada City.——C. J. Garland, of Mosquito Gulch, Calaveras County, says: "I find them an excellent machine."——S. D. B. Stewart, Supt. Lincoln Gold Mining Company, says they are a perfect success.——C. C. Hewitt, Supt. Keystone Mining Company, says: "I can sately recommend them to all millmen."

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other machine of its class.

For Description, Send for Circular to

J. HENDY, Sole Manufacturer,

No. 32 Fremont St., - - - - San Francisco, Cal.,

WHERE IT CAN BE SEEN IN OPERATION.

ALSO, MANUFACTURER OF

HENDY'S IMPROVED AMALGAMATOR and CONCENTRATOR,

AND DEALER IN

QUARTZ MILL MACHINERY.

Mining Superintendent

Of Twenty Years' Experience in opening and working Mines, building mills and working gold and silver ores, sp ecially those termed *Rebellious*, is open to engagement. Address, E. B. SMITH, this office.

SEWING MACHINES.—We have a first-class machine we wish to dispose of on favorable terms. Apply at this office.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,

Advances Made on Approved Securities.

ERICH G. GAERTNER,
MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office,

309 California street, Rooms 8 and 9.

SACRAMENTO, May 29th, 1875.

MESSRS. DEWEY & CO.—*Gentlemen:*

Yours of the 27th inst. is received. The patent came duly to hand yesterday, by express. Please accept thanks for your promptness in obtaining the same.

Very respectfully, DUNCAN BEAUMONT.

GOLD MEDAL

AWARDED TO

San Francisco Steam Pumps.

PREMIUM AWARDED TO W. C. WILCOX & CO., FOR BEST STEAM PUMPS, Wilcox's Patent. 1875.

We are prepared to furnish PUMPS UNDER CONTRACT, guaranteeing their ability to perform any specific work for which steam pumps are adaptable, such as

RAISING WATER FROM MINES

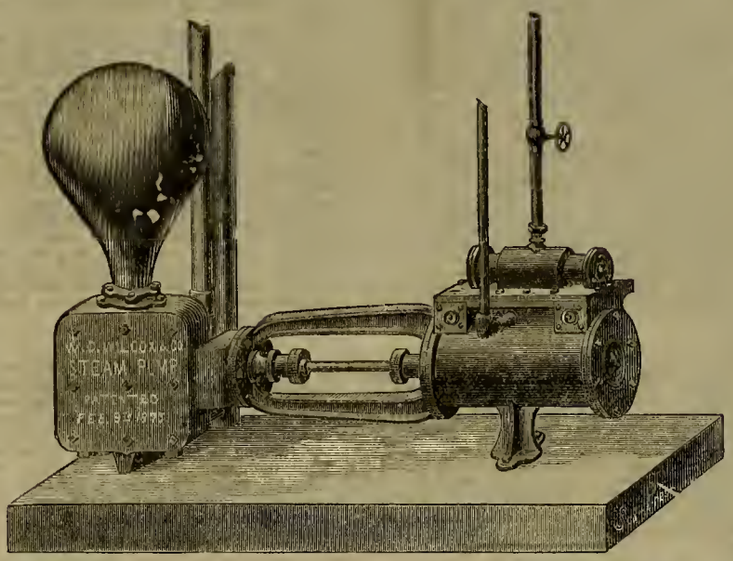
FOR WATER WORKS,

FEEDING BOILERS, RAISING WATER FROM WELLS; STEAMER AND SHIP PUMPS, ETC.

We would also call the attention of those interested, to our Direct Acting Deep-Well Pumps for raising water from

Any Desired Depth.

Also to our Especial Construction of Pumps FOR HANDLING QUICKSILVER or heavy liquids.



AFTER ONE OF THE

MOST THOROUGH TRIALS

Ever Had in the United States,

BETWEEN COMPETITORS

—OF—

Best Established Reputation,

In which, at great expense, the different Steam Pumps were tried under every test known to experts, the Examining Committee of the Tenth Industrial Fair of the Mechanics' Institute have awarded to us their

GOLD MEDAL

—FOR—

Best Steam Pumps on Exhibition.

We claim that our Pumps are the **best** ever made in **simplicity** of construction, economical use of power, **durability** and perfect adaptability for general uses, and we ask all persons interested to investigate **our title to this claim.** Salesroom at our Machine Shop, 114 and 116 BEALE STREET, SAN FRANCISCO.

W. C. WILCOX & CO., Proprietors.

The ALLEN ENGINE GOVERNOR.

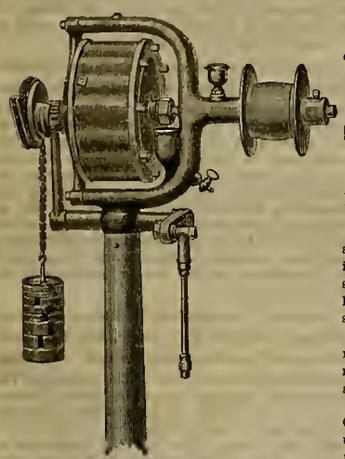


Fig. 1. For Variable Cut-Off Engine.

Uniform Speed in the Working of Steam Engines.

THE SIMPLEST AND MOST EFFICIENT GOVERNOR YET CONSTRUCTED.

ECONOMY and SAFETY.

Especially Valuable with Adjustable Cut-Offs. Capacity of Machinery Increased by Accurate Regulation of Speed.

Direct Saving of Fuel—Great Increase in Power of Engines.

The high rate of speed used acts advantageously in making the Allen Governor very sensitive; and all parts being lubricated, it works with the smallest amount of friction.

The speed of the Engine is maintained equally, without reference to the variations in amount of work being done.

The peculiar action of the Governor, which allows the use of a valve of large area, thereby admitting to the Engine cylinder the greatest possible boiler pressure at each stroke of the piston, has produced astonishing results by being attached to old engines, greatly increasing their power or effecting a direct saving of fuel, and in hundreds of instances doing both. In running an engine with the Allen Governor with high or low pressure of steam and with all variations of power, the throttle is opened wide in the morning and remains so until closed at night, thus relieving the engineer from all labor and care except keeping the engine oiled, and giving him a great deal of time for other duties.

Allen's Patent Governor Valve is constructed with a double disc in a tubular frame, and is perfectly balanced, there being no spindle as in the ordinary throttle valve to interfere with its equilibrium. The valve is moved by means of a lever, and is opened and closed by a rocking motion of a steel spindle, which is covered with brass, insuring the greatest possible durability.

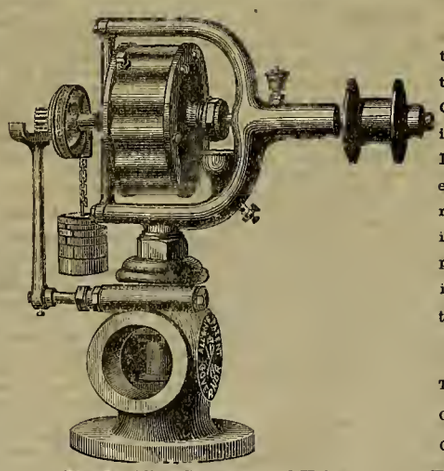

Fig. 2. Allen Governor and Valve.

We have Numerous testimonials from parties who have used this Governor, and watched its workings critically. In all cases the Governor has made the various engines to which it has been applied produce the most profitable results ever obtained.

Fig. 3. Section of Allen Governor.

PARTIES INTERESTED IN STEAM MACHINERY SHOULD EXAMINE THE ALLEN GOVERNOR, WHICH IS NOW INTRODUCED ON THIS COAST FOR THE FIRST TIME. FULL INFORMATION CONCERNING IT CAN BE OBTAINED FROM ILLUSTRATED DESCRIPTIVE CIRCULARS WHICH WILL BE SENT ON APPLICATION. Address,

PACIFIC IRON WORKS, First and Fremont Streets, near Howard, San Francisco,

MANUFACTURERS OF ALL CLASSES OF MACHINERY.

THOS. PRICE'S

Assay Office and Chemical Laboratory,

524 Sacramento Street, S. F.

Deposits of bullion received, melted into bars, and returns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of the interior by Express, and returns made in the same manner.

Careful Analyses made of Ores, Metals, Soils, Waters, Industrial Products, Etc. Mines examined and reported upon. Consultations on Chemical and Metallurgical questions.

(Continued from Page 206.)

WHITE PINE DISTRICT.

MAKING BULLION.—White Pine *News*, Sept. 16: The Stafford company, who are running the Smoky mill, are doing splendidly. The ore that has been worked during the week has averaged $70 per ton, just as it comes from the mine. The company have had some delays during the week on account of the water pipes and some other parts of the machinery of this mill being defective. The mill has stood idle for some three years, and the machinery could not be expected to be in first-class condition; however, in a very short time everything will be running nicely. An experienced miner informed us on Thursday last that he had visited the company's mine—the Stafford—and pronounced it a true fissure vein, and thought it made this best showing for a big mine of anything he had ever seen in Treasure hill. The ledge is 14 feet wide, and the ore becomes richer as development is made. We are decidedly of the opinion that the Stafford company will be one of the permanent institutions of this district.

Arizona.

GROOMS CREEK.—Cor. Arizona *Miner*, Sept. 8: The miners here are working with an energy that betokens success. All seem to be well satisfied from present prospects that this will be a fine mining camp. People are coming in daily. Willis & Co. are pushing on their work day and night, taking out fine ore, sinking shaft and running drifts. They are also building a shaft and ore house, 20x20, and will have it completed this week. They have built a large water tank and erected below it a "Cornish jigger" for washing and sorting the ore, which works very successfully and saves all the loose gold and leaves the ore clean and free from worthless rock. They now have a fine lot of ore and will soon commence hauling to the mill. Just above is the shaft of Hutchings & Behn, down 27 feet, and looking very well. Then comes Emil Gantz' claim, which looks well, and also that of Leighton & Co. who have some fine ore on the dump.

MINING MATTERS.—Arizona *Citizen*, Sept. 9: J. H. Bartlett came in from Ostrich mill this week, and Dr. Handy made a visit there and returned with 210 ounces of gold, worth $17.25 per ounce, which was purchased by E. N. Fish & Co. They report the mill running day and night and the results very satisfactory. They wanted 20 more good workmen for various duties in and about the mine and mill and handling of the ore, and offered good wages and board. The Ostrich company has passed its expensive trials and disappointments and is now enjoying handsome profits. There are 30 men at work at the Tecalo. Gen. J. B. Allen has bought the interest of John H. Archibald, and is going to move the works and increase the force and better systematize operations. The company has coal, wood and ore in abundance, and we shall soon hear of regular shipments of silver. A very rich silver vein has recently been discovered between the Guija mines and the Ostrich. Large samples brought into town show native silver. Developments will be made. Jas. Fresh is probably by this time in Globe district with a stamp quartz mill, having some time ago left Silver City, N. M., with one for this new and rich section. The reports from the Globe and Pinal districts continue favorable. There is some talk of a scheme to erect improved and large reduction works in Tucson. If perfected and executed, the very best results would follow to the people generally. We hear of $5,296 in gold bullion and dust being received this week by our merchants, and some small lots of silver.

Colorado.

BULLION SHIPMENTS.—*Colorado Miner*, Sept. 12: The Judd & Crosby works shipped, for the week ending Sept. 8th, five bars of bullion worth $6,547.04.

ELM CITY.—A run of over one and a half tons was made from this lode this week, the first and second-class ore running *twelve hundred ounces silver per ton*. How is that for high!

IMPORTANT SALE.—General James I. Gilbert, of Iowa, has purchased the Brooklyn mine, situated on Kelso mountain, of P. E. Morehouse and Robert Wood.

DIAMOND TUNNEL.—We learn from J. A. Fish, Supt. of this great enterprise, that the tunnel is now in over 1,100 feet, and within from 100 to 140 feet of the Dives lode.

HOMESTEAD.—This lode, on Griffith mountain, the property of Wentworth and Yandes, has been opened by a tunnel on the vein 208 feet, reaching a depth from the surface of 125 feet. The last 16 feet have been driven along a six-inch vein of very high grade ore, which still holds.

SAN JUAN.—The Silverton *Miner* is full of mining news, and judging from the tenor of its remarks we presume the miners are generally happy and hopeful.

Idaho.

THE MINES.—*Owyhee Avalanche*, Sept. 16: A new era has dawned upon this camp since recent movements have been consummated in connection with the Golden Chariot. Having been the leading mine of this camp for a long period, and having contributed very largely to the bullion product of the Territory, it is natural that people generally should feel an interest in its success. It therefore gives us great pleasure to be in a position to say that the cloud which has for a short time obscured the career of the Chariot has been removed, and henceforth this mine, with "Dirigo" for its motto, will lead the country forward to a new course of prosperity quite equal to that which we have experienced in our most palmy days. We feel confident in making this statement, as the circumstances fully warrant it. The recent change in the complexion of the management of the Golden Chariot company is destined to have a salutary effect. In the rich resources of Idaho there is a grand field for investment of capital. Our mines, if carefully and judiciously worked, will yield returns equal to those of any country under the sun, but unfortunately past mismanagement and blundering have had a disastrous effect, and the interests of both capital and labor have suffered in the ordeal. Now that we are on the eve of a change for the better, there is a disposition to profit by the errors and misfortunes of the past and retrieve blunders which had almost resulted in consigning the camp to obscurity for a time. Mr. Baldwin, the well known and energetic Superintendent of the Chariot, is back with us again. He has been in San Francisco for a few weeks, and the zeal and energy he displayed while there on behalf of the interests of this camp and in inducing capitalists to lend a hand in the development of our mines entitle him to our earnest praise. We understand that he will immediately pay off all claims against the mine. Operations will also be resumed in the mine without delay, and Mr. B. will employ as many men as he can work to advantage. The Poorman is running along splendidly. At the present point of operations the ledge is about two and a half feet wide, and much of the rock is unusually rich. There are nearly one hundred tons of ore ready for crushing. At the Empire the developments are most promising. The workmen in the stopes on the 6th level are taking out the finest rock that ever came from the mine. The ledge is three feet wide and shows up quite profusely in gold. At the Belle Peck and Potosi mines work is progressing finely and everything wears a bright appearance. Eight men are at work in the Belle. The Elkmore mill having been put in shape, will commence crushing Potosi rock next week. Our Wagontown correspondent, under date of 14th, writes: Work preparatory to the erection of the quartz mill of T. W. Jones & Co. is progressing satisfactorily. A number of the miners, anxious to see the mill going, have ceased work on their mines for the time being to lend a hand at the mill.

Montana.

ORE TO BE MILLED.—Butte *Miner*, Sept. 9: The La Plata company have contracted with Mr. W. A. Clark to supply him with 500 tons of ore, Mr. Clark agreeing to take it all within a specified time. He will not make a continuous run on this ore, but work a certain amount each month and purchase smaller lots from other mines, in this way aiding in the general development of the camp.

MR. W. A. CLARK has telegraphed to FRASER, CHAMBERS & Co., Chicago, ordering a Blake crusher. This will be shipped at once, and probably will arrive here soon after October 1st. This is a very necessary article; will pay for itself in a short time by the saving of labor, crush the ore much more evenly than it can be done by hand, and thus enable the batteries to run more smoothly and increase their capacity.

A. M. ESLER, Esq., has shipped during the past week to Messrs. Pope, Cole & Co., Baltimore, Maryland, for account of First National bank, Helena, 47,000 pounds of copper ore from the Mountain and Parrott lodes. As transportation is scarce, it is probable that the shipments will be light from this time, but Mr. Esler hopes to forward 150 tons before the close of the season.

MR. OLIN has ordered the lumber for a new automatic jig, which is to be constructed in accordance with plans furnished by Professor Knabe, and will be similar to those now in use at Dahler, Armstrong & Co.'s smelter in Glendale, which has proved a perfect success. By the use of this jig the cost of labor will be reduced and the capacity of the concentrator increased. It is Mr. Olin's intention to add others, from time to time, as rapidly as his means will permit.

PHILLIPSBURG.—Mining seems to be but little retarded by the overplus of rain; hauling from the mines is interrupted to some extent, but otherwise the work "goes bravely on." The Hope company, two days since, shipped 14 silver bricks to Deer Lodge valued at $10,000. This mine, from what information we can obtain that is reliable, looks well, and it is to be hoped that it will continue so for many months to come. Of the Trout we know but little; their mill is at work, and Captain Plaisted, we are informed, has been employed to build the hoisting works on the shaft.

Utah.

BRIGHAM.—Cor. *Salt Lake Tribune*, Sept. 15: About three weeks ago seventy-eight miners and laborers were discharged from the Nez Perces Co.'s mines, viz.: Nez Perces, Montreal, Telegraph, Roman Empire, and Grecian Bend. This reduction, although heavy and panicky-looking, was announced to be temporary only, and was said to be on account of the enormous quantity of ore belonging to this company lying at the Sandy sampling works, for which a satisfactory price could not be obtained. The places made vacant three weeks ago are being reoccupied, and rumor says 100 men will be employed ere Saturday dawns upon us. Call it fifty, which number, in addition to those already employed, will make eighty to ninety.

More of the Reese River Mines.

[From Our Own Correspondent.]

In my last, written from Austin, one or two claims within the city limits, well worthy of mention, and doubtless there are others in the same category, were unintentionally overlooked.

The Little Bonanza,

H. Leigh and B. Troxell, owners, promises, as its name indicates, to be a jewel of its kind, not to be picked up every day. It is located in the ravine, 400 feet above the Oregon shaft, and is now furnishing the mill with some very rich ore, said to be fully as good as some twenty tons previously worked, which ran for third and lowest class from $300 to $400; second class, $650, and for highest grade as much as $1,800 per ton, with more ore of the same character in sight.

The Defiance,

The property of Mr. Curtis, of the Manhattan mill and mining company, near the Dollarhide, is now leased to Turner & Humphries, who had some beautiful specimens on the dump. They seemed flattered with the prospect, and well they may be, if it yields its $75,000 this year as it is said to have done last season. A portion of the first fruits of this mine has been promised to be offered on the altar of the MINING AND SCIENTIFIC PRESS, to propitiate old Mammon, I presume, or some other mining divinity, or rather, as I have reason to believe, from a thorough appreciation of a journal such as yours, so devoted to the mining interests, so replete with mining news from every section, so ably describing and illustrating the different kinds of mining machinery and discussing from time to time the best methods for amalgamating, concentrating, and reducing ores, or a thousand and one of the many interesting and intricate questions that might be sprung in a mining community. On the

East Side of Lander Hill,

One thousand feet from the King Alfred, is the San Francisco, a late discovery of Warren and Vicas, of much promise, some of the first-class ore milling $1,030 per ton; second, $434, and third, $103. Within sight, in Emigrant canyon, the South Sonoma, belonging to J. Sutchell of San Francisco, was turning out ore that would pay well for working; assorted valued at $1,000.

The Patriot,

In the vicinity of the Yankee Blade, five miles from Austin, was located by James McCann as early as 1866, since which it has been worked almost uninterruptedly, not only paying all expenses for development but yielding handsome returns beside. The claim consists of 1,200 linear feet, properly secured by U. S. patent, and is located on a good large ledge with vein matter from two to eight feet wide. It can be traced by the croppings for about four miles, and is on the borders of two separate and distinct geological formations; in fact, wherever the walls have been exposed, the lode is found incased between the slate on the east and the granite on the west, a feature often regarded as a favorable indication. The yield from the mine for the four months prior to August last was in the neighborhood of $30,000. The whole number of tons of ore extracted from the mine since its opening has been something upwards of three hundred, with an average working value of about $350 per ton, giving a total yield of over $105,000. The developments consist of tunnels or levels to the extent, in the aggregate, of 1,200 feet, together with chutes and winzes connecting the two lower and principal levels, from which most of the ore was derived which thus far has so well paid for extracting. If good steam hoisting works were erected, and a double compartment shaft lowered between the Patriot and the Green Erin, a location on a parallel lode 400 feet northeasterly, also the property of Mr. McCann, through which both ledges could be advantageously worked, it would add much to the value of the property.

If, in addition to this, a good ten-stamp mill were put up near the mine in which the ore could be dumped, thus saving handling and hauling to Austin, the mine might be made more remunerative than ever. Along the same ledge as the Patriot are several promising mines, viz: the Cochran, Morris & Caple, the Chase, and others, some of which have paid exceedingly at times, and a few of which are at present in operation. The Chase, in New York canyon, is now being worked under lease by J. E. Farrell and others. All the indications are favorable for finding rich ore as soon as they reach the chimney for which they are now running. At one point a tunnel had been run about 700 feet. As far as could be ascertained this mine has yielded altogether in the neighborhood of $200,000.

The Morris and Caple,

Located between the Chase and the Patriot, is opened by a tunnel following the ledge about 1,000 feet. It also has yielded large sums, much of it paying $150 and upwards per ton; some of it $1,500, and one lot of ore from a spur running as high as $2,900. It has been pretty thoroughly breasted out above the tunnel, the greatest distance to surface at any point being about 400 feet. Little prospecting has been done below that level.

The Northern Belle,

Situated on the east side of New York canyon, opposite the Chase, is one of the recent discoveries here that is opening up with excellent indications, showing some rich stephanite, ruby and black sulphuret ores that had given one assay at least as high as $1,772. It is owned by Messrs. Byrne, Lacey and McKinney, no better fortune could be wished for than to have it turn out as well as its namesake at Belleville.

In what was once the Amador district, some seven or eight miles northerly from Austin, there is quite a number of locations and a series of ledges, running generally through the slate, from six to eight feet in thickness.

The Amador Con. S. M. company has a claim here that was well spoken of about Austin, the prevailing opinion being that it only required proper development to make it a good property. This much has been stated for the encouragement of stockholders, as barely sufficient work was done on it for some years past to hold it. In fact,

The Occidental

Is the only claim now worked to any extent in this immediate locality giving assays of $1,000, with an average per ton of $350, although at present extracting but little ore. It is owned by Finnegan & Rosling, and is worked through a tunnel 180 feet in length, which is now being rapidly pushed in a different direction with the view of tapping the ledge at a much greater depth, where it is hoped their labors will be richly rewarded.

In closing this account of the

Mines of Reese River District,

It may be safely stated, that with all the drawbacks from small veins, breaks and faults, and from former failures from sheer ignorance or mismanagement, there has as yet been no district visited in this State outside of Gold Hill and Virginia, so full of promise or so rich in results. At the former places over a hundred claims have been located that have never paid a dollar on the investment and probably never will, for the simple reason that the so-called ledges in which the locations are made do not carry sufficient gold or silver to pay for the extracting. But here it is different. While the ledges are usually small and the ores found in pockets or chimneys, yet they seldom fail to pay expenses if judiciously and perseveringly worked, often yielding handsome returns for the labor and capital expended. The ledges run through the granite at Austin, through the slate at Amador, and at Yankee Blade and New York canyon are found on the dividing line between the two formations, in some cases having slate on the hanging wall and granite on the other, possessing all the marks of true fissure veins, and a character for permanence and stability seldom found.

A. C. K.

DIPHTHERIA is prevalent in San Francisco. There were 170 deaths from it last month.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

THE sanitary policy which suggested the establishment of public baths for the poor should dictate an appropriation for supplying GLENN'S SULPHUR SOAP for the use of those bathers who are afflicted with cutaneous eruptions and skin diseases. Sold everywhere.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING SEPTEMBER 12TH, 1876.

AMALGAMATORS.—Wm. McCourt, Virginia City, Nev.

MACHINES FOR SAWING STAVES.—Benjamin H. Catching, Forest Grove, Ogn.

ANVILS.—James Jenkins, Cortez, Nev.

APPLE CORERS.—Isaac Rodgers, Sheridan, Ogn.

BOOK SHELVES.—John L. Boone, S. F.

CARRIER ATTACHMENT FOR SEWING MACHINES.—John L. Boone, S. F.

COFFINS.—Samuel Rodgers, Los Angeles, Cal.

STENCH TRAPS.—John Peter Schmitz, S. F.

BAG SEWING MACHINES.—William Webster, S. F.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

ANTI-CONTAGIOUS COFFIN.—Samuel Rodgers, M. D., Los Angeles. The object of this invention is to provide an improvement in coffins for the burial of the dead, and it is called an anti-contagious coffin. It consists in constructing a perfectly tight wooden coffin somewhat larger than is necessary to receive the body. The inside of the coffin is lined with wire gauze cloth, which is retained at a short distance from the sides, ends, top and bottom, so that the space can be filled with an anti-contagious compound, after which the usual linings and trimmings may be put on and the cover fitted hermetically. The interior of this coffin is coated with a composition which is entirely impervious to water, air or gas. This composition is an invention of Dr. Rodgers. The space outside the wire is filled with a mixture of seven-eighths wood charcoal, well burned and finely pulverized, and one-eighth oxide of calcium, well burned and pulverized. A soft rubber band is glued upon the upper edge of the coffins, and when the lid has been screwed down all will be both water and gas-tight. By this construction, when this is done, there is no danger of contagion from the escape of noxious gases or from the fouling of wells in the neighborhood of cemeteries.

COMBINED FIRE PLACE AND FURNACE.—Reason Wiley, Arcata, Humboldt county. The patent covers a novel combination of a fireplace and a heating furnace, by which rooms adjacent to and above that on which the fireplace is situated may be warmed. It consists of a peculiarly constructed back for the fireplace, in which braces for strengthening the plate and preventing it from warping or twisting are so combined as to leave passages through which the air to be heated can circulate and eventually pass into a chamber in the masonry, from which it is distributed by the proper passages to the room to be warmed.

FORMING EMBANKMENTS OR LEVEES.—George Swift and William T. O'Neale, San Francisco. This patent covers a new method of making embankments and levees. The claim is: The method of forming levees or embankments; the same consisting in constructing low embankments or timber retaining walls successively above each other for the formation of canals, channels or troughs, and filling said channels by any suitable means with sand, gravel or other sedimentary deposit, mixed with water, which is drawn off after the sediment has been deposited, thus forming a concrete embankment.

SOLDER CUTTING MACHINE.—Ferdinand C. Smith and Charles E. Smith, Portland, Oregon. This invention relates to an improved machine for cutting bars or rods of solder into small pieces or pellets, such as are now much used by tinners for convenience in soldering joints. It also relates to certain improvements in casting the solder in order to adapt it to the machine and expedite tin work.

KNIGHT'S American Mechanical Dictionary is a book for all persons who make, buy, sell, use, or want to know anything about tools for machines, or are curious as to the history and development of mechanic art. It is a descriptive word-book of tools, instruments, machines, chemical and mechanical processes; civil, mechanical, railway, hydraulic and military engineering; a history of inventions; general technological vocabulary; and digest of mechanical appliances in science and the industrial and fine arts, etc. For circulars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissuee taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments rscorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Pern, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Swsden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cnba, Roman States, Wurtemberg, New Zealand, New South Wales, Qneensland, Tasmania, Brazil, New Grenada, Chili, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in Europsan countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schednle prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific Statee from two to six months (according to the location of the country SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of goverment, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valnahlo patents may be lost by extra time consumed in trane mitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patente can rest assured that their communicatioas and business transactione will be held strictly confidential by us. Circnlars free.

Home Counsel.

Our long experience in obtaining patente for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previons applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions aod patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patente, or purchasere of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not ooly lost their money but their inventione also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency

Engravings.

We have enperior artiste in our own office, and all facilities for producing fine and satisfactory illustrations of inventione and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

DEETKEN'S

ROASTING FURNACE,

For Gold, Silver and Copper Ores.

The roasting capacity of the Furnace, per 24 hours, is from 6 to 50 tons, according to percentage and nature of the sulphureted ore, with an expenditure of one and a half to two cords of wood, and two to three shifts of unskilled labor, according to amount of ore handled. The Furnace is adapted for chloridizing, as well as oxidizing, roasting, and for the manufacture of sulphuric acid. In point of cheapness of construction and efficiency in working, the Furnace is far the best in use. Millmen in need of a cheap and efficient Roasting Apparatus will apply to

G. F. DEETKEN,

Consulting Metallurgist, Grass Valley, Cal,

Furnace can be seen on application for permit, at Grass Valley.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

VOLUME XXXIII. Number 14.

[Editorial Correspondence.]

The Centennial at Philadelphia.—No. 15.

With the advent of cooler skies the people are coming up to this great world's exhibition of a century's progress in immense numbers, and the Centennial grounds are daily thronged with large and lively delegations from every part of the country. It is now a pleasure to visit the exposition, instead of the penance it was a few weeks since, when Philadelphia was like a fiery furnace, and when the usually refreshing showers that sometimes passed over the city seemed to intensify rather than lessen the sufferings of the poor unfortunates who selected that time to visit the exhibition.

Woman at the Centennial.

We have already pointed out some of the peculiar characteristics which mark this great anniversary exhibition; but there is still another most noticeable one in the part which woman has taken in regard to it. The patriotism and philanthropy of the women of America has ever been of a high order, and far more active than in any other country; and it may be regarded as morally certain that if the world is ever completely civilized and enlightened, so that the apocalyptic millennium may be fully realized here on earth, that event will be mainly brought about by the efforts of womankind—by woman's love and woman's work. The mission of woman is rapidly enlarging, and already extends to fields that a few years ago were considered quite beyond her province or her power. Her efforts may even now be considered as embracing everything which tends to the improvement and happiness of the world. Her future is glorious, beautiful, illimitable!

When this great exhibition was fully decided upon, and the work of preparation had actually commenced, but was beginning to lag for want of confidence and enthusiasm, the women of the country came promptly to the rescue, and said that it must and should go on, but that it should not be left to the men alone. They claimed an interest in the patriotic enterprise as well as their husbands and fathers and brothers; for they, too, had gained freedom and independence, and in the universal progress of the country had secured the privilege of standing before the world an equal of man, entitled thereto by a code as ancient and as sacred as that which decreed equality to the sterner sex. Acting upon that assumption they formed a national aid society to the Centennial commission, with auxiliary branches in most of the cities and States throughout the Union, and went earnestly into the work of raising money. The efforts of the ladies of California in this direction will never be forgotten. The results of those efforts are said to have astonished the ladies of Philadelphia, and the gentlemen managers of the enterprise as well. By the sale of Centennial stock, by fairs, tea parties, etc., they soon realized a large amount of money, and by their example and energy encouraged and enlisted thousands of men in the enterprise who might otherwise have stood permanently aloof. The stories of Bunker Hill monument and of the Christian Commission during the late war began to come uppermost in the minds of many, and an impetus was given to the work which, if it did not form the turning point, at least did much to make the effort the grand success which we see to-day.

The Women's Pavilion.

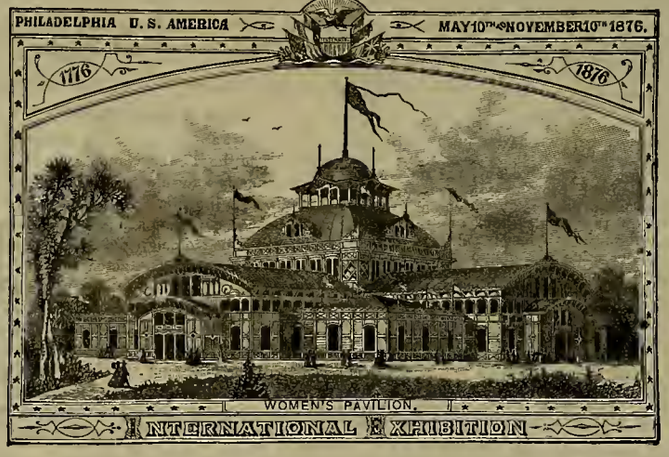
This building covers an area of 30,000 square feet, and is formed by two naves intersecting each other at the center.

In its design and construction the originators were careful to exclude as far as possible everything emanating from the head or brain of the opposite sex. Though they did not actually build the pavilion, they paid for its erection, and all the exhibits therein, except the machinery by the aid of which their work is done, is the work of their own hands. This rule is carried even to the engine house, where the six-horse power steam engine has been run and kept in order from the day of opening until now by a lady engineer—Miss Emma Allison, of Grimsby, Ontario county, N. Y.

The structure was designed and is occupied solely for the exhibition of women's work in all its branches, and for the illustration of those educational systems and moral and benevolent enterprises in which women have borne the chief or most prominent part. The entire enterprise has been planned and is conducted by them; and as the great Corliss engine which drives the machinery in the machinery building was first set in motion by a man—the President of the United States—so the engine which drives the machinery in the women's pavilion was first started by a woman, the wife of the Emperor of Brazil.

A Bird's Eye View of Woman's Work.

One of the objects of this special display is to help forward this good work of reform by making the public better acquainted with its plans and purposes, and to infuse new strength and energy into the lives of those who are already engaged in the work. The great design of the exhibition as a whole, that of object teaching, is fully sustained in this particular department. A visit to the women's pavilion cannot fail to interest and instruct, and we



recommend to all who are in doubt as to what women are good for outside of the kitchen, nursery or parlor, to go to the pavilion and see and learn.

As the visitor reaches the main entrance he reads, emblazoned upon the portals, this appropriate inscription, "Let her works praise her within the gates," and if he goes up the steps with an unprejudiced mind he feels, on entering, that her works, as there displayed, do praise her and make known at a glance the great variety and number of industrial pursuits which are open to females; the demands of which, on the hand or brain, are quite within the scope and sphere of the sex. The exhibits are neatly arranged and properly classified, and the entire space is filled up.

We have neither time nor space to call attention to even a moiety of the exhibitions in this direction; but it is a noticeable fact that in point of taste and elegance, as well as originality of design, the display of American handiwork is in marked ascendence. There is nothing about it stereotyped or conventional. It seems to have come from a democratic school where every one is free to develop according to her peculiar taste or genius. The only motto seems to have been "Excelsior."

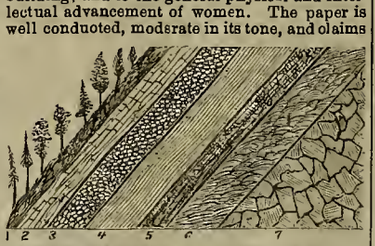
There is also a good display of wood carving, large and small, which furnishes abundant evidence that such work might safely be left entirely to female skill and genius. This display embraces the ornamental work of furniture, pianos, organs, fancy ornaments, etc. Perhaps the most uniformly creditable exhibitions are those from the Lowell, Cooper and Cincinnati art schools.

The inventive genius of the ladies is made manifest in numerous ways and samples. A Boston lady inventor exhibits what she calls a "surprise bed," which is quite a curiosity in its way. A life preserving mattress is also shown as the invention of Mrs. H. B. Mountain, of New York, which has the indorsement for usefulness and safety of that aquatic expert, Paul Boyton. There are also numerous other inventions for household and kitchen use, etc., but we can mention only one, a "P. G. G." (patent griddle greaser), the invention of Mrs. Sherwood, of Boston. This invention is designed to avoid the troublesome, vexatious and objectionable deposit of grease on dress and person which is so unavoidable in the ordinary use of rags, pork rinds, etc., in the very necessary act of preparing those toothsome "hot cakes," which form such a desirable portion of the morning meal. Blessed be the inventor of the "P. G. G."

The Japanese department forms quite an attractive feature in the kind of work peculiar to that singular people. This exhibition affords abundant evidence that there is more taste, skill and ingenuity among the ladies of Japan than they have generally been credited for.

Among the more practical exhibits may be seen quite a number of silk, worsted and other looms, which are in daily operation. Also a printing press and types, cases, etc., forming a complete printing office—the editorial and compositor department of which is run by females, but we noticed that the foreman was of the opposite sex. The office is chiefly employed in printing a weekly paper called *The New Century*, devoted to the interests of the exhibit in this building, and to the general physical and intellectual advancement of women. The paper is well conducted, moderate in its tone, and claims for the sex only sound and reasonable privileges in the world of industry and art, such as must be accorded her by any reasonable being.

W. B. E.



Structure of the Santa Cruz Mountains.

McKenzie's San Jose foundry have just turned out some tubes for the Almaden mining company and now they are hard at work finishing an engine and hoisting apparatus for the Union Consolidated mining company, up near the Deadwood. The engine is a stationary of 20-horse power. The fly wheel is six feet in circumference, and boiler and other appurtenances to match.

Dr. Thos. Laycock, the eminent English medical writer and physician to the Queen, is dead.

Geological Outline of Santa Cruz Range.

(Written for the Press by C. L. Anderson, M. D.)

Santa Cruz range of mountains extends from the Golden Gate to the Bay of Monterey. It is about 75 miles long by 25 miles wide, commencing under the Golden Gate and rising gradually in a south-easterly direction, reaches its highest point in Mount Bache (Loma Prieta of the Spaniards), 3,780 feet, which is nearly on a direct line between the cities of San Jose and Santa Cruz. Thence, by a series of gently undulating foothills, it slopes down to the Pajaro valley and the Bay of Monterey, to the sea level.

This range is noted for its abundance of timber, running streams, rich soil and salubrious climate. It abounds in grand and beautiful scenery—the bay of San Francisco, Santa Clara and Pajaro valleys, and Monte Diablo range, including Mount Hamilton, on one one side, and the Pacific ocean on the other.

The amount of timber, and the great variety for fuel and building purposes, is immense, and, as yet, scarcely touched.

Grapes, apples, peaches, apricots, oranges, figs, almonds, and fruits of like character can be grown of fine quality and abundant in many places in this range.

The flora is exceedingly varied and interesting, embracing perhaps a larger number of species than can be found on an equal area anywhere in the United States.

There is a great variety of mineral springs of as valuable qualities as any country can boast of. Some day invalids in large numbers will resort to them. The intrinsic value of the waters will be aided by the genial climate in which they are located.

I herewith present a geological section of this range as it would appear if unbroken or undisturbed.

1. *Soil.*—This is of the richest quality, made up, as it is, of the *debris* of the different rocks underlying and intermixed with an abundance of vegetable mold.

2. *Alluvium.*—Earth deposited from streams or lakes. Present in the little basins and valleys of streams.

3. *Conglomerate.*—More or less cemented in large, uneven masses.

4. *Shale and Sandstone.*—In this formation is often found coal and petroleum. There are places where large masses of sandstone are saturated with petroleum. The coal is found in thin strata, of good quality, but nowhere, as yet, discovered in quantities sufficient to pay for mining.

5. *Crystalline Limestone.*—This is of purest quality, and the lime manufactured from it cannot be excelled.

6. *Metamorphic.*—The limestone gradually runs into the metamorphic. This formation is most abundant, having, at some period of the earth's history, been stratified and subjected to heat. In places gold has been deposited.

7. *Granite.*—Once in a while this is found at the surface, but not often. There are places where granite of good quality for building purposes can be obtained.

These formations are very much broken and disturbed; and at no one place do they assume much regularity. Hence, I have called this section *ideal*, in order to show that this range, if perfect, as it may have been before the upheaval, would present the formations in regular strata, and by inclining them to the center of a ridge, they would appear like my illustration. In this grouping the line between each formation is not always very distinct. The two contiguous groups combine so as to produce a great variety of rocks.

I present this geological outline that at some future time I may particularize some of the things found in this exceedingly interesting range of mountains.

Santa Cruz, September 21st.

Two quartz mills in operation at Unionville, and one at Park City, will add materially to the billion product of Lewis and Clark county, and will also assist in improving business in Helena, Montana.

CORRESPONDENCE.

Alta Mine and its Magnificent Machinery.

Enrrors Prese:—It may eeem eingular, nevertheless it is an actnal fact, that notwithetanding the immense wealth ae developed iu a comparatively emall epace on the celebrated Comstock lode, hut little if sny systematic developmente have been condncted at any distance, north or sonth, from the immediate vicinity of the great deposite first discovered, and snhsequently hy deeper explorations made to yield their preeent eatisfactory dividends.

Mining experts and those familiar with the lode and the country since ite firet occupancy ae a miniug district, can give no good reason why mines of vset wealth ehonld not he opened either

North or South Upon the Mineral Belt,

And among the present imperfectly worked locations ahonnding on theee extremee. To the contrary, many have and do assert that, judging from the oroppings, the formation of the country, ite geological structure and the general trend of the ledgee, they are firmly convinced that when capital can be moved from ite present center of attraction and expended in these eections, mines will he opened that in richnsse msy equal thoee at present yielding eo handsomely, adding new reservoirs of wealth to the State and nation, and wonders to the mining world.

It may he there ie a

Magnetic Attraction About Money

That oaneee it to persistently adhere to eome favored locality from whence large enms bave been taken. Be tbis as it is, it ie certainly true that, with few commendahle exceptions, it seems impossible to induce those of wealth and experience in miuing specnlatione to extend their operatione beyond the magic oircle embracing the mines of Virginia and Gold Hill. To add to the eingularity of this fact, we know that numeroue locations, irreverently called "wild-cate," have shown npon little work such prospects tbat were they near any of the leading mines would command nnlimited enms for their full and complete development, while those referred to, failing to pay dividende from the "grass-roots," are allowed to remain untonched, waiting to reward with their wealtb the enterpriee of more libsrsl cspitalists.

As before mentioned there are, however,

Some Meritorious Exceptions

Whose energy should not only meet with a reccompense eqnalliug their expectatione, but receive the hearty support of all who desire a thorough exploration of the great Comstock mineral helt heretofore superficially worked. Notably among them we may mention the Silver Hill, Dayton, Jnstice, Kossuth, Rock Ieland, Amazon, South End, Florida, and the enhject of thie sketch, the alresdy well-known Alta.

This Mine

Came into the posseesion of the company who are managing its development ahout the 1st of October, 1875. They immsdiately commenced active operations, and up to the present time have permitted nothing to retard their rapid progress in taking a prominent plsce among the leading prospective mines of the State. The location ia at the lower part of Gold Hill, and consists of 1,800 feet lying directly north of the Woodville, eaet of the Jnstice and southeast of the Overman and Caledonia, joiuing the first two mines on the reepective points mentioned. From this it will be seen that the location in itself is all that conld he deeired, and more particularly so when it is understood that the richest ore taken from the Justice, and that now heing worked and yielding satiefactory results, is from the 800-foot level, which is eeveral hundred feet east of their main shaft. Also, that the Alta ehaft is on a direct line (being due north) several hnndred feet from that of the Woodville, which strnck (at ahont 400 feet) tbeir ledge of rich ore. But the Alta shaft, being situated on the hill, ahont 250 feet higher than the Woodville, would not, in all probsbility, encounter the same vein until a depth of hetween 650 and 700 feet is attained.

By many this location is considered of greater importance for mineral wealth than either of its sisters, the Justice or the Woodville; for, as it is well knowu, the preeent bonanzas in Virginia are eitnated several huudred feet eset of the original croppings, as discovered by the first locatore of the Comstock, and all the large mining companiee, the Gould & Curry, Ophir, Chollar, Hale & Norcroes and Savage, found it necesary to sink new ehafts to the east of their first locations and workinge.

But the eituations of the

Dividend Paying Deposits

In the Crown Point and Belcher minee gives them still stronger hopeand greater encouragements, ae they were found 400 and 700 feet east of their main shafte, showing that there, as in Virginia, the trend of the great ore hodies is, without doubt, oonsiderable distance east of the croppiugs; bnt with this difference, that thoee north of the divide bear to the northeast, while from the Yellow Jacket, in Gold Hill, their bearing is southeast. Such being the case there can he no reason, logical or geological, why the Alta may not, at eufficient depth, reveal ore hodies of corresponding richnese.

Their Shaft

Is of three compartmente, and timhered in a msnner eecond to none in the State, the whole heing done under the foremanship of Mr. Boyle, sn old and experienced miner on the lode. The eugines nsed for einking, though not as powsrfnl as thoee need in the larger mines, are perfectly adequate to sink from 1,200 to 1,500 feet, while the bnildings are all of the most substantial character. In the progress of the work the superintendent, Mr. C. Derby, ehowed bis good jndgment in urging upon the company the practicability of erecting at the firet

Pumping Machinery

Of such conetruction and power ae to obviate all further inconvenience. The reasons for this are good, ae it is well known that hundrede of thoeande of dollare have been nselessly expended by the injudicions selection of machinery—hy plaoing pnmping and hoisting machinery npon minee wholly inadequate to the labor required. In many cases small pumps have been attached to heavy enginee, and vice versa, which invarisbly necessitates the equalizing of the same, at heavy coet and correeponding loss to the companiee. In thie osee, the Trustees of the Alta, being composed of men thoroughly posted in miving matters, met the snggestions with a cordial spirit of liberality, and now, after months of labor and grsat expense, have erected, and now in operation, one of the finest pumping engines in the State. It ie very difficult to describe machinery without sketches or models, bnt we will endeavor in this case to at leset make it ensceptihle of nnderstanding.

The Pumping Machinery

Is driven hy a compound condeusing engine, operated by a Davey patent differential valve motion. The initial or high-pressnre cylinder is twenty-seven and one-half inches in diameter, and the condensing or low-pressure cylinder is forty-four inchee in diameter hy eix foot etroke. The cylinder and slidee are set upon a hox hedplate of great strength. This plate is holted firmly to two heavy girders running directly across the shaft, forming the hearings for the two hobs, and altogether forming a continuous fonndation-plate of cast iron of seventy fset in length—the whole firmly holted to tbe rock, instead of etone foundation. The holding-down holts are let into the rock twenty feet and fastened with eulphur and lead. First ie the condeneing cylinder, bolted directly to the end of which is the high-preesure cylinder, the piston of which pssees tbrough the center of the head and attachee to the center of the cross-head. The two pieton-rods of the low-pressure pass through tnbes cast one on each side of the high-pressure cylinder, having proper bushings and etnffing-boxee on the head of the high-preseure cylinder. The connecting rods to the bohe attach with hack jaws on each eide of a high-pressnre piston-rod at one end and to ths first hoh at the other. From the first hob a conuecting-rod runs acroee the shaft to the second bob, operating each in opposite directions. There are two spear or pnmp-rode, operating on two ten-inch plunger pumps 300 feet from the surface. As these are connected to hobs working in opposite directions, they are always in perfect balauce and reqnire no hallast-bobs in the shaft. The euction lift-rod is connected to one of the spear-rods and works a fonrteen-inch Cornish sinking-lift pump 200 feet bslow the plunges. This epear-rod is halanced hy a weight of 4,000 pounds on the hack end of the boh farthest from the engine.

The air pump ie operated from a center piston-rod running bsck of the cylinder. Tbe condenser stands between and a little to the one side of the engine center, allowing room to get at the cylinder hesd. The engine valves sre halsnced slides—these being preferred for their simplicity and tightness, hesides having a positive motion with the cross-head of the engine. Thus, shonld the pump loose the water and the engine jnmp of on an increased velocity, the action would first shut off the steam from the pieton, and shonld this not he sufficient to stop the velocity, tbe valve wonld he still further thrown over, and the steam would be admitted on the oppoeite side of the piston snd hriug it to a stsndstill. The valve is connected to the center of a plain lever, one end of which is connected to tbe crose-head and psrtakeo of its motion, while the other end is attached to a rod having a small steam cylinder on one end and a water cylnnder on the other. The pieton of the water cylinder is solid, and no water can pass from one end of the cylinder to the otber except through a commnnicating port, in which is a regulating valve, which, when properly set, admits of a certain and nniform speed to the end of the lever to which the msin valve is connected. Thus the lever has a coostant and uniform motion and independent of the engine at one end and the variable motion of the cross-head at the other. Now, as the opposite ends of the lever move in opposite directions, it is evident that if the ende move at the same velocity the center-pin will not change its position, hut should the small water-cylinder end go faster, then more steam would he admitted to the main cylinder, and increase its velocity or equalize it with the other end. But should the end conuected with the cross-head increase its velocity over that of the cylinder end, then it would cnt off the eteam from the cylinder, and the engine wonld etand still. However, motion must be eeen to he properly understood. We don't wish to convey an idea of its heing complicated. On the contrary, it is very eimple snd few in parts, and this, in a great measnre, tends to its succese. The whole machine is something new on the Cometock lead. First, the compound condensings; sscond, the management of cylinders and bedplatee; third, the double hobs and double acting force pumps, and in the reat and convenient msnner in which they are eet.

The Engine

Is capable of operating a 14-inch pump (giving maximum economy in fuel) to a depth of 1,500 feet. From that point to 2,000 feet the preesnre will have to be increased and the expansion diminished and economy in fuel lost. Should a greater depth be determined upon, high pressure or live steam conld be need in the condensing-cylinder, and thus command a power to go to over 2,500 feet, hut the engine would be too wastefnl and expensive to rnn, used thns.

At preeent, the flow of water in the shaft heing light, the engine makes but one etroke in 63 eeconds, and can, if neceesary, be reduced to one stroke in 10 minntee. At present the engine ie run with one 48-inch hoiler, consuming from one and three-fourths to two cords of wood per day. It mnet be borne in mind that

The Steam Generated

With this small amount of fuel runs all the machinery connected with the mine, hoisting engine, etc., which is surprisingly emsll, and we doubt if an eqnal amount of heavy machinery ie run with as little expense on the Cometock, or even in the State. It is also expected that the amount will even be reduced lese than this hy placing the asbestoe felting on the steam pipee, hoilere and drums, which will soon be done. The engine wae deeigoed and hnilt at the Risdon iron works, San Francisco, and gnaranteed to sink to a depth of 2,500 fest, and throw from that point 24,000 gallons of water per hour. The whole was under the eupervision of Mr. W. J. Saulkild, aud set in place hy Mr. M. G. Foote; and the neatnees and accuracy of the whole machinery provee how well he merits his repntation as a firet-olase machiuist and engineer.

In conclusion I will give the names of the officere of this company, whoee energetic liberslity has done eo much for the section of connstry in which their miue is located: President, Seth Cook; vice-president, W. T. Meyers; trustees, Daniel Cook, Johnny Skae, Robert T. Graves; superintendent, C. Derby. R.

Alpine County—its Mines and Resources, Past Present and Future.

[Written for the Press by Victor Harland.—No. 8.]

Silver Mountain District.

To the eastward of and abont one-half mile distant from the Pennsylvania miue is the location formerly known as the Noble mine, now termed the Californis. This mine, hy reasou of its former condition and subsequent abandonment by the old company, deserves a more extended notice than the actual developmeuts—which are but superficial—wonld express. Ite eingle hietory is that of far too many of the mines of this county, and the circumstances attending that hietory, in common with other reasons, given heretofore iu theee articles, have eerved to a continnance of that deplorable state of things which has hung like clouds of deepest gloom around snd abont the county, and only dispersed hy the events of the past 18 months.

Its History

Is as follows: Located in 1861, its mammoth proportions and uniform strength, together with the pureness and general character of the qnartz on the surface, cansed considerable excitement at the time of its location. Nor did this abate till long afterward, when hy reason of the more than foolish decisions of owners of this and other mines in this portion of the district, it became alarmingly apparent that outside intereets had been directed elsewhere, in search of posseesions more easily gained and where reasonable encouragement would he given to those willing to embark in mining enterprieee where capital was neceesary. In many places the oroppings rise 25 and 30 feet above the snrface, and are plainly visihle for a distance of hslf a mile. The only development formerly given this mine consists of a tnnnel of 125 feet in length, discontinned before the lode was reached, and nntil the relocation of the mine, made during the past year, nothing frnther wss prosecuted that would tend to a development or improvement of the mine in any particular. This relocation, embracing two locatione of 1,500 feet each, covers the eame extent in length formerly held by tbe old organizstion. The new proprietors, Meesrs. Ford and Brown, are engaged in sinking

An Incline Shaft

On the lode, and which, at present writing, has reached a depth of about 15 feet. Samples of the ore extracted preeent a fine appearance, the qnartz being of a very determined character, and the present owners are endeavoring to develop their property in accordance with their means, by ignoring the preeence of the tunnel mentioned, and following the lode downward from the eurface.

Soon after the firet organizstion in 1861, and while this tnnnel wse in progreee, a propoeition wae received from a party of San Francieco capitalists who had examined the mine, and feeling satisfied that it was a location of conaiderable merit, desired to pnrchase ehould their offer be accepted hy the owners. The price determined upon hy theee partiee wss $30,000—a price not often realized for a totally nndeveloped mine—but euch wae the general tenor of excitement and over-eetimated valnes attached to locations at that time that thie splendid opportnnity was loet hy a refussl to sell the mine, even at those figuree. Had the owners been as wise as they afterward hecame by force of circumstances, they would have realized the amount etated and the mine paesed into the posseesion of an enterpriciug company of State orgsnization, with a paid in capital of $300,000 with which to develop the mine as it shonld have been developed—hy shaft, inetead of the ineignificant snrface tunnel, which wae thought at the time wonld he amply eufficient to place the mine in prominences before the mining world. At this period the company stock wse readily ssiling at $15 per foot, or at an aggregate value of $45,000. Later, these aspiring but too confident owners wonld have been content with a tenth portion of the amount first offered them, and the deependency of the majority, when from lack of funds the tunnel which was their "open sesame" to the vaet wealth beyond wae discontinned, is only eqnaled by that exhibited hy Mark Twain when first he realized the loes of hie "million" at Anrora, Nev.

During the Past Six Months

This mine hae again rsceived the attention of persons residing in your city, who are watching the present developments with a view of purchasing all or a portion of the mine shonld the quality of the ore prove that which is expected from the characteristics ae ehown on the surface. The ore—the black enlphuret or eilver glance—is proportionately of a comparatively low grade, but is eveuly distributed throughout the quartz, which of itself is of a firm, compact nature throughout. Unuenally free from the haser metals, it is more trsctable than the ore extracted from the msjority of the mines in thie county, and the width of the lode, which is not lese than 25 fest, rendere it more than a mere probability of the exietence of large bodiee of ore when a proportionate depth ehall have been reached. Taking into consideration the general appearance and chsracter of tbe qnartz extracted at the point penetrated on the snrface nnd the corresponding snrface dieturhancee on either side, no marked improvement in qnality can reasonably be expected until a depth sball bave been reached that will open the depoeite lying helow these immense coutortions of nature in ite immediate vicinity, hut from the

Appearance of the Ore

Now heing taken from the ehaft, and the fact of ite great quantity and even distrihution eo near the eurface, I would predict a successful extraction of bullion with economical working at a mill in connection with the mine. It has many natural advantagee, not the least of which is an advantageous mill sits in cloee proximity to the mine, thus ohviating any difficulty in transportation of ore. A good eupply of foreet timher is easily accessihle, and the water power all that is necessary to furnish a dozen steam mills of general capacity. The mine, unless its merits are totally ignored hy those seeking legitimate investments, will eventnally become a leading feature of the district. The present owners, thongh confident of having in their posseesion a valuable property, are seeking a disposition of it npon reasonahle terms, which will undonbtedly be effected when the preeent developments shall have reached a proper basis for a determination of its actual value.

Captain Eads' Success.—The latest information is this: It is gratifying to be assured that the Eads jetty syetem of improving the monih of the Mississippi river is at last nn assured succees. The last report ie that a channel 20 feet in depth has been secnred, over the bar, and the work of deepening and widening this channel to the required extent is progressing favorably. Contrary to general expectation a new bar is not forming at the mouth of the jetties, hut the channel deepens beyond as well as within the harriere. The sum to be paid to Captain Eads for the whole work of making a channel 30 feet deep, at aversge flood tide, and 350 feet wide, is $5,250,000, in instsllments of $500,000 esch at successive stsges of the work, except that $1,000,000 is to be reeerved to be dishursed to the contractor at the rate of $100,000 a year for ten years after the completion of the contract, if the jetties continne effective.

Work at Port Said.—The *Engineer* reports the progress of the work at Port Said as follows: Less dredging work was required last year than in 1874. The quantity of stuff dredged out of the great Ismail hasin at Port Ssid in 1875 amounted to 190,000 cnbic meters; the removal of this stuff secured the hasin its maximum depth throughout. The maintensnce of the sidings and bed of the caual last year involved the dredging of 721,000 cubic metere. The quantity of stnff removed in 1875 hetween the two seas only amounted to 52,700 onbic meters. The quantity of etone used during the during the year in fscing hanke amounted to 24,000 cubic metere. The canal was navigated with facility last year by eteamere drawing nearly 27 feet of water, and 430 feet in length.

SCIENTIFIC PROGRESS.

The Color and Fragrance of Plants.

Prof. Vogel has a long article on this subject in the *International Review*. Some of his conclusions are so interesting that we make the following extracts:

We cannot doubt that the different taste, smell and color which characterize leaves, blossoms and fruits, in million-fold variation, are due simply to chemical operations, the nature of which, we must confess, are as yet utterly unknown to us. One mineral substance, chromium, is known to us as the source of nearly inexhaustible number of tints and colors of every description; but its scale, rich as it is, seems to be infinitesimally restrained, when we compare it to the hundreds and thousands of brilliant colors with which even the poorest vegetation covers the surface of the earth!

We must not forget that color is unreal; it is not a corporeal, palpable substance, but merely a state or condition, which affects our eye in a certain way; it does not exist, but is represented to us by the variable decomposition of the light, as the surface of bodies throws back or reflects only a portion of its rays, and absorbs the rest of them. For instance, we call a body, the surface of which absorbs every other ray of the light, and allows only the blue one to meet our eye, blue. The surest proof of the assertion that no real or corporeal color exists—that the colors are, as Goethe calls them, "deeds or children of the light"—must be found in the fact that some persons cannot perceive colors which others see distinctly; and that the colors entirely depend upon the manner in which the light is thrown upon them. Dyed cloth and even natural flowers often show, under artificial light, another color than that shown by day. An intensely yellow flame, such as is produced by the burning of soda salts, makes red substances, such as crimson or cinnabar, appear colorless; and red solutions, looked at under this light, seem to be as clear and transparent as pure water. Moreover, it is quite certain that the form of a substance greatly influences its color. Almost every color gains by fine pulverization. Thus a solid piece of cinnabar is not red, as cinnabar powder appears to our eyes, but dark brown, and the color becomes proportionally brighter according to the degree of pulverization. Oxide of mercury, the crystals of which are of a shining red color, becomes orange-yellow during the process of pulverization. On the contrary, dark blue smalt can be changed into a colorless powder by long continued pulverization and trituration.

But chemical action produces no more remarkable influence upon the color of a given substance than by the physical changes which it causes. As far as minerals are concerned, we are able to follow the reactions which appear to be the cause of a transformation of the color; we know exactly what takes place when white chloride of silver is blackened by the influence of the sun; we can give a chemical explanation of the change of colorless indigo into colored indigo. But the chemical transformations in the bodies of living plants, by which the most manifold and brilliant colors are produced, are almost entirely unknown to us. We see a flower pass through the entire scale of red, from the softest pink to the darkest purple-brown, but can give no explanation whatever of the mysterious process. We know, for instance, that the light of the sun greatly influences the color of living plants, and experience has taught us that, in most cases, its total exclusion is equivalent to the absence of every color; in other words, that it produces white leaves and blossoms. However, this rule is by no means without exception, as many roots, the roots of alcanna, for instance, although buried in the soil and completely excluded from the rays of the sun, possess a strong and vivid color. We can explain neither the rule nor the exception; on the contrary, we know that, as far as lifeless matter is concerned, mineral or vegetable colors are weakened, and gradually destroyed, rather than enhanced by the action of the light. Our ignorance in this respect restricts our influence upon the coloration of flowers and blossoms to a very modest and nearly empirical one. A mere chance has led to the discovery that the infusion of sulphates of iron into the soil darkens the hue of certain plants which contain a considerable quantity of tannin; and the gardeners have profited by this discovery for the culture of the hortensia. But these examples are rare; and as yet we must renounce all claim to the control and influence of the natural course of things in this field. We may be able to change the color of a plant or flower by transferring it to another soil, but we are never sure of the result, and cannot give any scientific explanation of it.

The fragrance of a flower is likewise produced by chemical action which hitherto has escaped our closest investigation; we see the result; we see that a flower, like the bee which transforms pollen into honey and wax, fabricates volatile oils out of air, water and light; but the chemical process itself is a complete mystery to us. We only know that the slowness or rapidity of the evaporation of these oils is the cause of the stronger or weaker odor of the flower. The mode of their formation is a good example of the unlimited variability and manifold variety of vegetation's chemical powers. Many plants do not limit themselves to the formation of certain volatile oils in their blossoms or flowers, but produce, at the same time, various kinds of oils in their different parts. The orange tree, for instance, produces volatile oil in the leaves, flowers and the rind of its fruit. A close investigation convinces us that these differ, not only in their smell and taste, but also in their weight, density and other physical and chemical qualities; that, in short, they are different and independent substances, which cannot be mistaken for each other. The same plant must, therefore, possess three different organisms, by which it generates three entirely different substances out of the same ingredients. What chemical laboratory, be it ever so well furnished and skillfully managed, can boast of results in any respect so wonderful? And when will the time come when we may surprise even these mysteries of nature's slow and patient but mighty working, perceive their results, explain their causes, and—if possible, by our own appliances—repeat and renew the wonders of the creation?

New Meteoric Mineral, Daubreelite.

Professor J. L. Smith has discovered a new meteoric mineral, of which he says in the *Journal of Science*: I have thought proper to designate it after M. Daubree, who has done so much in the study and elucidation of meteoric minerals. It is found on the meteorites of the Mexican desert.

Daubreelite is a black lustrous mineral, highly crystalline in structure, occurring on the borders of the troilite nodules, and sometimes running across the center of them, as may be seen in one of the specimens, where, in a nodule of troilite, a vein of the mineral traverses the very center of the nodule, which is two millimeters in width and twelve millimeters long. It has a distinct cleavage, but I cannot make out its crystalline form. It is very fragile, and in the attempt to detach it from the iron, it breaks up into small fragments resembling small particles of molybdenite. It is feebly attracted in very fine particles when a strong magnet is brought in contact with it. This may arise from the presence of a minute quantity of troilite which it is very difficult get rid of. Pulverized, it furnishes a perfectly black powder, the smallest particle of which gives, before the blowpipe, a very strong reaction of chromium. Heated very intensely, it loses its brilliant color and becomes a dull black.

The powdered mineral is dissolved completely in nitric acid. The solution is intensely green, and furnishes a strong reaction of sulphuric acid and oxide of chrome. The other strong acids attack it but slightly. This solubility in nitric acid readily distinguishes it from chrome iron. The following would express its true composition: Sulphur, 37.62; chrome, 62.38. This mineral is an interesting one, and is found in a very strange place, yet from what is revealed to us by the spectroscope with regard to the vapors surrounding the sun, the element chrome must be widely diffused in the matter of the universe.

A NEW GAS.—The Sheffield and Rotherham (Eng.) *Independent* says: Mr. W. Wright has invented an apparatus by means of which atmospheric air becomes speedily converted into gas. This is done by air being forced into a cylinder, or cylinders, in which is a petroleum spirit known as gasoline. Out of the cylinder the air comes charged with the properties of the spirit, and burns more brightly than gas produced from coal. Its heating properties are then small, but as soon as a blast is applied to the flame it gives out an intense heat. It can readily be understood that such an invention as this can be made applicable to various purposes; and, amongst other things, Mr. Wright has recently applied it to the purpose of cooking. The stove can either be portable or fixed; the latter would probably be the case at hotels and other large establishments. The air is forced into the cylinders, and the blast applied to the flame by means of an electrical engine, which can be worked, it is said, at a cost of halfpenny an hour. The oven is heated in five minutes, the boiler in five minutes more, and then five joints and vegetables can be readily cooked. Mr. Wright has also applied his invention to the soldering of metals and to the burning of old paint from wood work, a portable cylinder and a pair of bellows enabling the workman to take his fire wherever he wants it. It can also be applied to the heating of lead in the streets while repairs are being made to water or gas pipes.

GEOGRAPHICAL.—The Spanish government has appointed a commission to inquire into the physical conditions and possibilities of the Philippines. A professor of botany is to accompany the expedition to report the nature of the flora of the interior, and the condition and the extent of the forests. A survey is to be taken of the entire group and a map, drawn on a large scale, is in consequence to be published. The mountain ranges are to be the objects of a special investigation; the hight of all the salient points is to be accurately ascertained, and all traces of metallic products to be noted. The officers in charge of the expedition are to take such notes of observation as shall enable them on their return to draw up an exhaustive monogram on the entire physical condition of the islands. It is to be expected that many branches of scientific inquiry will profit by this research in a so long neglected and most interesting region.

THE DEVELOPMENT THEORY.—At the recent meeting of the American Association for the Advancement of Science, Prof. E. L. Morse delivered an address in which he summed up all that America has done to promote the growth of the development theory. He said the theory originated in America. In 1813 an American, William Charles Wells, born at Charleston, South Carolina, in 1757, read a paper before the Royal Society, in which he attempted to account for the color of dark-skinned races of man by citing the changes of animals under domestication, showing that varieties of men and animals were thus occurring, not exceptionally, but constantly, and that different breeds of animals were thus obtained by man's selective supervision. Hence, he argued that a similar selection among men had been effected by the comparative immunity from certain diseases of those who had dark skins. This is, substantially, a part of Darwin's theory of natural selection, which is credited wholly to him. It seems the honor of the invention belongs to America. Classifying the work of various American investigators, Prof. Morse mentions, among those prominent in producing new evidences for the doctrine of natural selection, Prof. Charles V. Riley of St. Louis. He says: "Prof. Riley's proof of the inter-dependence of flower and insect in the case of the Yucca moth is a scientific triumph."

MECHANICAL PROGRESS.

Steam Hammers.

How many who guide the ponderous steam hammers know the history of the invention which does such effective work? A writer in the *Colliery Guardian* takes up some early points in the implement which are interesting:

Nearly a hundred years ago, James Watt, following up his great improvements on the steam engine, seriously contemplated the application of steam power to hammers required in forging or stamping, and he actually secured a patent in the month of April, 1774, in which he described a heavy hammer for forging or stamping, without the intervention of rotative motions or wheels, by fixing the hammer or stamper to be worked either to the piston or piston-rod of an engine. Watt's patent does not seem to have ever been worked out to a practical result, and the same may likewise be said of the patent secured by Deverell in the year 1806. Still, it was left to a Scotchman, James Nasmyth, although then at Patricroft, in Lancashire, to work out to a successful issue the idea of employing steam power to effect the motions of a hammer in forging operations. That was in the year 1842. Scarcely had the need for such an instrument been suggested to the fertile mind of Nasmyth than he brought forth one of the most perfect of artificial machines, and noblest triumphs of mind over matter that modern engineers have yet developed. It was a five-ton hammer, that is to say, the block or mass of iron forming the striking part was of that weight. In the Nasmyth patent the hammer is attached to the piston-rod of an inverted cylinder; it is lifted by the steam and is allowed to fall by its own gravity, or is forced down by the steam acting upon the upper side of the piston.

Very soon afterwards attempts were successfully made to construct steam hammers upon plans somewhat different from those of Nasmyth. The first successful result in this direction was that of Mr. John Condie. In the Condie invention the cylinder is movable and forms the hammer or striking portion of the mechanism, and the steam may be made to act on both sides of the piston. Since this invention was successfully worked out, the Glasgow district has acquired a world-wide fame for the extent to which various engineering firms have manufactured steam hammers, as also for the excellence and serviceableness of the tools themselves.

Various firms in the Glasgow district have given more or less attention to the making of steam hammers. Mr. Yule, nearly a quarter of a century ago, constructed the first steam hammer made under the patent of the late Mr. Rigby, of the firm of Rigby & Beardmore, Parkhead forge, Glasgow. It was a two-ton hammer. The type known as Rigby's patent has become exceeding y popular, and for some classes of forge-work it actually divides the honors with the Nasmyth hammer in its most improved form. The special feature of the Rigby patent is that the hammer bar, is made of a section other than circular. Of course the stuffing gland is made of the same section and very deep. It thus acts as a guide to the hammer bar, and obviates the necessity for guides at the top of the cylinder or on the side framing, as is the case with other types of steam hammers. By means of this arrangement various advantages are secured, for not only does it facilitate the handling of the metal to be forged, but it likewise simplifies the machine, and renders it less liable to injury.

LARGE STEAM HAMMER.—The French people, in order not to be behind in regard to large steam hammers, are now constructing, in the works at Creuzol, a steam hammer of 130,000 pounds, or over 64 tons. It will have a stroke of 16 feet, and surpass the famous steam hammer of Krupp two and a half times. It will cost, including the erection, over $400,000.

A Hill-Climbing Locomotive.

We have noted, from time to time, the progress which is making in the contrivance for locomotives for steep gradients. We find in the London *Mining Journal* some experiments with an ingenious method of hauling railway trains up inclines, invented by Mr. H. Handyside, and consisting in running a locomotive a short distance in advance of the train, then scotching it, and hauling the train by means of a wire rope, repeating the process until the top of the incline is reached. The test was made on the London & Northwestern railway at a point where the gradient was one foot in 14. The mode of ascending the incline was as follows: The engine was coupled at the siding to three trucks loaded with limestone, or iron chairs or rails, and weighing without the engine, which is 22 tons, about 35 tons. The train ran along a quarter of a mile of level line to the foot of the incline. Here, without any loss of time, the engine was uncoupled, the trucks remained stationary, and the engine ran up the incline at the rate of about 25 miles an hour, paying out the steel wire rope from the drum, that having been previously fastened to the front truck. Having ascended half way the engine stopped, the grippers were dropped on and clasped the rails, and the steam was turned into the cylinders which worked the drum. The three trucks were then rapidly drawn up by the rope, and as soon as they reached the engine a strut at the rear was dropped, which firmly supported them, the engine ran to the top of the incline, was again fixed to the rails, and drew the trucks up to the top, was coupled to them, and drew them away to a siding, and then ran down the incline without any necessity for the application of the brake grippers, fetched three more trucks, and repeated the operation.

The special timed work was to convey 18 trucks loaded with stone and iron, and weighed by the London & Northwestern company, from the Middleton siding to the top of the Hopton incline. The whole weight without the engine was 190 tons. The engine reached the loaded trucks at the siding at 34 minutes 40 seconds after one o'clock. The trucks were taken up three at a time, and the whole 18 were raised to the top of the incline, and all but the last shunted into a siding, at 13m. 15s. after three o'clock, so that the whole work occupied 1h. 38m. 35s. Of this time, however, 17m. 43s. were taken up by traversing the level part of the line to the foot of the incline, which formed no part of the work to be done as compared with that of a stationary engine. Again the men stopped to take in water, from not having first filled the boiler, and that occupied 6m. 57s. Deducting these two items, the actual time taken to raise 190 tons up an incline a quarter of a mile long, on a gradient of 1 in 14, and, therefore, rising 100 feet, was 1h. 13m. 55s.

THE SAVING IN STEAM STREET CARS.—Those who are working on the invention of steam street cars will be interested in the economical side of the question, as given by the Philadelphia *Times:* The average cost of the horse car now used in Philadelphia is $1,100. Eight horses a day are required for each car, which have a combined value of $1,080, four sets of harness cost $80, making the entire cost of car and equipment $2,260. The steam cars, ready for use, can be built for about $2,800. The horse cars last, on an average, about ten years; the propelling machinery of the steam cars will last as long and probably longer, and when it is known that the average life of the horses used in the street railway service is only three years, it is seen that, as regards first cost, the steam cars have a decided advantage. When a comparison of current running expenses is made, the practical superiority of the steam car is still more apparent. The car now running on Market street consumes about 560 pounds of anthracite coal a day, worth about $1.65; the daily expense of feeding and care for eight horses in the stables of the West Philadelphia railroad company is $4.40, or a yearly difference in favor of each steam car of $1,003.75. No account is here taken of the cost of stables, etc. The number of men required for running the steam car is the same as for the horse car, a conductor and driver.

FOUNTAIN NOZZLE.—A new fountain nozzle of very ingenious and novel construction has been devised by M. Turettini, of Lyons, France, which promises to be of great value to cities which have water supplies of considerable head. It has been tried in Lyons and also Geneva, Switzerland, and has met with complete success. It is on the principle of the Giffard injector, the narrow nozzle through which the water issues with great velocity being surrounded by a "petticoat," which bulges just above the interior nozzle and is then drawn out into a larger nozzle; the lower part of the "petticoat" dipping beneath the surface of the water in the basin. The water is drawn from the basin and carried up with the stream from the interior nozzle, thus augmenting the volume discharged, but, of course, to a less height. As small jets under great heads break up at no great hight, this diminution in hight of jet is less than would at first be supposed. An additional "petticoat" may be provided, connected with the air by a pipe, the air drawn in converting the jet into a mass of spray. The economy of this jet is said to be 40 to 50 per cent., but of course this will vary much with head, the result to be obtained, etc.—*English News.*

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

LADY FRANKLIN.—Alpine *Chronicle*, Sept. 16: On Friday last, Crowson Smith, Vice-President, and Richard Meager, Superintendent, arrived from San Francisco for the purpose of starting up work on this mine, which has been idle since 1866. Sinking will commence on Monday next, and work will be prosecuted with vigor.

CALIFORNIA CON.—Parties from San Francisco are negotiating for the purchase of this mine, and probably it has been consummated. The intention is to commence work at once by sinking. The mine is situated in Noble canyon, Silver Mountain mining district.

ADVANCE.—For the past 10 days, on account of striking a heavy body of water, work has been suspended, there being 90 feet of water in the shaft. A pump, 15,000 gallons per hour, arrived to-day, and will be in position for work on Tuesday next.

EXCHEQUER.—Good ore continues to be taken from this mine. A house is being erected for the reception of the new engine.

I X L.—Good ore is being taken from the upper tunnel. Stations are being prepared at the other levels. Grading for the mill is progressing.

AMADOR.

TALISMAN MINE. — Amador *Ledger*, Sept. 23: This mine, commonly known as the Hubbardsville, situated half a mile from Amador City, on the road to Sutter Creek, is being rapidly brought into condition for actual mining work. It is under the superintendency of J. Tregloan, an experienced miner and superintendent, who is deserving much credit for the judgment he has played in superintending the early operations of the Grover mine, which now ranks with the most prosperous mines of the county. Work on the Talisman is at present confined to taking out water. The hoisting works are run with water power, with 50 feet pressure. It is the intention to have 300 feet pressure for the mill. Both mine and mill will be run with water power at an average expense of $12 per day, while steam power for the same would cost from $70 to $80. Some rock has recently been taken from the old shaft, which prospected well. Altogether, the Talisman, under the able management of Mr. Tregloan, promises to become a good paying property in the near future.

BUTTE.

COMMENCING WORK.—Oroville *Mercury*, Sept. 23: Next week work will be commenced on the Main Feather River company's claim under the superintendence of one of the best and most practical miners in the State, H. D. Lathrop. From time to time we have referred to this company as one that we thought would succeed. Of course it has met with much opposition, but this has delayed it only for a short time. The idea of mining the bed of the river by sinking a shaft on the shore and running an incline so as to tap the bed of the river was indeed a new one, and it is no wonder that many claimed that it could not be done. But now the company have $23,000 in its treasury, and next week the work begins. We shall watch its progress with a great deal of interest, and from time to time note the progress of the work for the benefit of our readers. All who know anything of this part of the river admit that the gold is there in abundance, but they do not all think that it can be got out by this method. We believe it can. Eminent engineers claim that it can, and we have an abiding faith in their opinions. It will take some time to sink the shaft and run the incline, for the rock is hard, but it is the intention to get improved machinery and push the work as fast as possible.

HUPP'S MILL.—From Mr. Hupp, who was in town on Monday, we learn that he will shut down the mill in a short time. He is already making preparations to work his large gravel claim at Centerville this winter with an increased force of men, and good clean-ups may be anticipated.

CALAVERAS.

A "CHAMPION" CLEAN-UP.—Calaveras *Chronicle*, Sept. 23: We have had frequent occasion, during the past few years, to refer to the unprecedented yield of the Champion mine, at West Point, in this county. Great as its product has been in the past, recent developments prove that the *ultima thule* of its prosperity has not yet been reached, and we frankly confess that the late returns from the mine have prepared us for believing any report, however extravagant, regarding its richness. A crushing of 65 tons of Champion ore, in Carlton's mill, yielded $11,000, an average of only a fraction less than $170 per ton. There is not another mine in the State that has or can make an equally good showing, and the yield mentioned is not an exceptional one for the Champion, either. The product of the mine for several years past has been surprising, and at the present depth—a little over 300 feet—the ledge is wider and richer than at any point above. Labor is being very actively pushed forward upon the mine, and we are prepared to hear of still richer developments in the future. The bullion resulting from the late clean-up was brought to town Tuesday, under a strong guard, and melted and assayed by our local banker, C. Schlund, Esq. May such mines as the Champion multiply.

ITEMS FROM COPPEROPOLIS.—Our correspondent sends us the following: Mr. R. Dean, of Salt Spring valley, came into Copperopolis a few days ago with upwards of $300 in clean river gold from his claim on the Stanislaus river. There has been a discovery made of an asbestos vein in Salt Spring valley, near Hettick's ranch, and is now being opened by parties who are confident of its value. T. McCarty, Esq., who is one of the owners, is also possessor of several quartz mines, which are now held in abeyance for the purpose of finding the latest improvements in mining machinery, so as to work them to the most profitable advantage.

REPAIRING THE DITCH. — The Mokelumne Hill & Campo Seco company's canal is being thoroughly cleaned and repaired preparatory to winter. It is the custom of the company to strengthen and clean the ditch every fall as a safeguard against "breaks" during the rainy season. The work does not interfere with mining operations, however, the, extensive system of reservoirs provided by the company preventing any interruption in that respect.

EL DORADO.

GOOD MINING NEWS.—*Mountain Democrat*, Sept. 22: The other day we were allowed to inspect several samples of ore recently taken from the 800-ft level in the St. Lawrence mine. All of these samples were exceedingly rich. One of them would yield, we should judge, at the rate of at least $5,000 per ton. This is the first ore taken out since the water was pumped out under the management of Messrs. Alderson and Mierson. It is gratifying to know that there is a compact and rich pay streak on the 800-ft level of this mine, for public confidence in the quartz interest in this entire section hinges largely on results at the St. Lawrence. We understand that about 10 days will be consumed in raising an air shaft, and then vigorous operations will be prosecuted on and from the 800-ft level.

INYO.

LOOKOUT MINES.—Coso *Mining News*, Sept. 23: From a special reporter, sent to examine and report upon the mines of this district, we have the following: Things are bright in Lookout. I visited the Minietta Belle, and drifts from the bottom of the main shaft have determined a veritable bonanza, north and south, to the extent of 40 feet, thickness unknown. The ore is of fine quality and daily improving. They have now at this mine a large quantity of good grade ore opened up ready to be converted into bullion at any given moment. I should judge that 15 tons of ore are being taken out daily at this mine. The Mountain View, to use a familiar Darwin phrase, is a bird, and is now in such shape that four men can extract ore in sufficient quantities to run a ten-stamp mill steadily for a long period. I was informed by Mr. Cox, the superintendent, that their water pipe and mill is about being contracted for and will soon be on the ground. It cannot come too soon, as their ore dumps are fearfully crowded. Mr. Cox says he can shell out 10,000 to 12,000 tons very cheaply and lively when required.

LOOKOUT.—In this mine, one of the Modoc company's series, we learn from Mr. Barber, superintendent, that a wonderful strike was made during the week. In the new tunnel of the Lookout, now in some 160 feet, at a depth of 130 feet from the surface a body of ore has been encountered which assays from $12,601.83 to $13,404.37. We saw a specimen of this ore, and handled the buttons from which these assays were obtained. It is nearly free milling ore, containing but a very small percentage of lead. It resembles very much the soft brown chloride ores found in the Ehernardt. The extent of this rich body is not yet determined, as no cross cutting at this depth has been done. In the upper tunnel, some 50 feet above, the width of the vein was 20 feet, of ore which will average $200 per ton. An immense pile of ore has been taken out of Confidence No. 4 in simply running tunnels and drifts, no stoping having as yet been done, except that the ore has been taken out between the walls for a width of 12 feet, and timbers placed overhead preparatory to stoping. In No. 3 the same body of ore is encountered as that in No. 4, and when 20 feet further they will be directly under the ore body of No. 4, where the latter tunnel was started. In No. 3 tunnel the ore body is widening constantly and the ore getting better in quality. In No. 2 there is a splendid pile of ore on the dumps, which has been carefully assorted. This ore averaged before being assorted $215 per ton.

THE FURNACES.—One of the furnaces is almost completed, and the other will be ready in less than a week. Teams have been sent to Panamint for more piping, and as soon as they return the pipe connection from the tanks to the water jackets will be made, when the furnaces will be put into operation. If they work successfully we may expect to record as large and fine shipments of base bullion as ever went from Inyo county.

MARIPOSA.

MINING ITEMS.—Cor. Tuolumne *Democrat*, Sept. 23: Situated about half way between the Mount Jefferson and Nonpareil is the Italian or Diamond Gulch mine, the owners of which are erecting a new ten-stamp mill, thus increasing their capacity and indicating financial prosperity. I paid a visit to the Douglass mining company's mines, the Potosi and May Harrison, about one and a half miles southwest of Coulterville, and found them stirring and lively on the Potosi. The company has sunk a shaft a distance of 240 feet perpendicular and have commenced drifting along the vein, which they have opened a distance of 100 feet, showing a width of six feet, with well defined walls. This is justly admitted to be the best paying mine in Mariposa county at the present time. The company has a large mill of 35 stamps propelled by a 60-horse power engine, and is capable of reducing 30 tons of ore daily. The crushed ores after escaping from the batteries are carried through sluices to six Wheelsr & Wilson's amalgamating pans and are here passed through a still finer course of pulverization. The ores being all free, no difficulty appears to be experienced in reduction. The company employs about 80 men at present. I passed the May Harrison and found that the owners had sunk to a depth of 450 feet with extremely good results, this mine showing a larger vein than the Potosi. The Hesalow mine (or Heslop) on Gentry's gulch has been lying idle since last November with but little apparent sign of awakening to activity. It is the old story so often reiterated, want of capital being the cause. The Bandarita, on the north fork of the Merced, is still pounding, but I believe with but indifferent results. There are, in fact, several mines in this vicinity whose successful progress is greatly retarded by a lack of the root of all evil to extract the crude rock from the veins and ledges. The Ferguson mine, which passed into the hands of an English company about six years ago, has again become the property of local owners, being owned by Mr. John Ferguson, of Sonora, and a company of gentlemen who with characteristic energy have resumed active operations. The mine, which is undoubtedly a good one, has lain idle for a number of years, and it has been found necessary to tunnel to reopen the works. A number of men are at work in this direction, working night and day.

MONTEREY.

ANTIMONY.—Salinas *Index*, Sept. 21: Mr. Shriver, superintendent of the Salinas quicksilver mining company, has presented us with a couple of fine large specimens of antimony ore, taken from the face of the tunnel, which is now in 70 feet on the lode. When they commenced the tunnel the seam of antimony was only about two inches wide, but it has now increased to two feet wide, getting larger the further in they go. One of the pieces of ore has quicksilver running all through it. The company are very jubilant over their prospects, being confident they have a good thing. The Stayton quicksilver mine, of which the Salinas mine is a continuation, has recently been sold to a company of capitalists, comprising W. M. Lent, J. F. Boyd, Wm. Willis and Mr. Harper, of San Francisco, and Jno. H. Moore and S. A. Bishop, of San Jose. The new proprietors have already commenced operations on the ground. The machinery for two or three large furnaces, costing in the aggregate $10,000, is on the way, and hands are employed excavating the foundation for the works. The building of the furnaces will be pushed forward as rapidly as possible, after which the mines, both quicksilver and antimony, will be worked up to their fullest capacity. All this is very encouraging to the owners of the Salinas mine adjoining.

NAPA.

SILVER ORE.—Napa *Reporter*, Sept. 23: Quite an excitement has been prevailing lately created by the discovery of some silver ore in the range of mountains west of Monticello. Some Mexicans are now at work on the ledge, but nothing more than a few croppings have been discovered.

NEVADA.

NORTH BLOOMFIELD MINE.—Grass Valley *Union*, Sept. 22: The North Bloomfield mine, located in this county, has at last allowed some figures of its production to be made public. On the 18th of this month, gold bars of the value of $15,800 were shipped from the mine to San Francisco. This gold is only the partial proceeds of a run of 22 days. The expense of taking out the amount is estimated at $7,800, which leaves a profit to the company, for the run, of $8,000 The Bloomfield mine is about the most extensive enterprise in the "hydraulic mining" line there is in the world. The company owns acres of gold, and the proceeds will increase for several years to come.

STRUCK THE CHANNEL.—Nevada *Transcript*, Sept. 20: The Cold Spring gravel mining company have been at work for a long time trying to penetrate the ancient river channel thought to run through their ground. They have struck gravel several times during the past six months, but have continued explorations with a view to get somewhere near the bottom of the channel, and to discover if possible its dimensions. All their work has been done by tunneling and drifting, and any one that knows anything about mining knows that it is difficult to tell what is ahead of you under ground, and where it is located providing it is there. The Cold Spring company have struck it, however, and have now reached a point where it is no longer doubtful where they are. They know for a certainty that the old channel on which was located the Live Oak and other fabulously rich diggings, runs through their grounds a mile and a half distant from those old claims. They have proved that the intervening ground, which had never been touched, is a part of the richest channel in the world, and they have, we feel sure, demonstrated facts sufficient to prove to capitalists that here is a field holding out inducements unsurpassed in the State. The company have established the fact that they are on the channel, and the gravel in the claim speaks for itself. All old settlers and miners who knew the old claims on this side of it, say the gravel and the gold in the two are identical. Residents here feel sure that the ridge between Sugar Loaf and Cold Springs will have a thousand laborers employed upon it inside of two years. The discovery at the Cold Springs gives new life to every one, and raises the most hopeful anticipations.

RICH gravel continues to be found in the Cold Spring ground. Bets are offered that on the bedrock of the channel the gravel will yield $100 to the pan. It used to do it on this end of the channel.

PLACER.

MINING ITEMS.—Placer *Argus*, Sept. 23: A small force of men are engaged in the shaft of the St. Patrick mine. The Pugh mill of five stamps is engaged in crushing the ore taken out. It is expected that work will soon begin on the new mill.

The Good Friday mine is looking well, and the prospect of striking the pay shute is excellent. At seventy feet deep a drift has been run fifty feet west, reaching the shute. At 120 feet another drift was run thirty feet west, striking it again, showing that the shute pitches east. At the west end of this drift a winze has been sunk in the pay shute thirty feet on the ledge, all the way in good ore. The ledge averages thirty inches in thickness at this point, of good ore. Work on the main shaft has been resumed, and at the rate the shute pitches to the east, it is expected that the shaft will reach it in about seventy feet.

McLaughlin, Hurst, Robinson and Bradbury are at work on the old Peter Walter ledge. They have pumped out the old shaft and are now in the lower level east of the shaft, stoping up, expecting to find the pay shute. The ground west of the shaft has been worked out, paying well, and there is no doubt that good ore will be found east of the shaft.

L. Shurtleff is prospecting a ledge on Duncan hill and is taking out some good rock. The ledge is large and the pay shute is about 40 feet wide. Some of the rock crushed has yielded an ounce to the ton.

John Bewen has taken about ten tons of good rock from an old ledge on Dutch ravine that promises to pay well. The ore is being crushed, and if the yield is satisfactory he will go ahead. The ledge was worked some years ago, and paid well.

Hawkins and Rhodes have sunk about ten feet on a ledge two miles below Ophir. The rock is said to be rich, but the water is so plentiful that they had to suspend work. They will go further when they get machinery to keep the water out of the way.

MINING ON RED DIVIDE.—Placer *Herald*, Sept. 23: In this hydraulic and sluice mines on the Divide, all is activity at present in preparing for the coming water season. In the drift claims, of which there are quite a number, it is different. Not depending on the water supply they work the year round, and are, therefore, at present very busy. The Weske claim and the Hidden Treasure, near Michigan Bluff; the Hope and Sebastopol, near Forest Hill, and the Centennial, near Todd's Valley, besides many others of which we have no present information, are all pushing things vigorously, and according to our information are, without exception, paying well. This character of mining is steadily increasing, and promises to become very extensive. The Forest Hill divide alone, which is underlaid entire with gold bearing gravel, supposed from prospects thus far made to contain sufficient of the precious metal to pay handsomely for drifting when worked systematically, is extensive enough to afford steady employment for 1,000 men for nearly as many years. In the whole upper part of this county there seems hardly a limit to the gold bearing gravel deposits, and in the opinion of most practical miners they will all in time be worked.

DITCH MATTERS.—The North Fork water ditch has been completely repaired from source to sink, and is now, in reality, better than new. The preliminary work of placing the main Bear River ditch and its tributaries in a similar condition has been commenced, and will from this time forward not be completed, we understand, be prosecuted with vigor. At Auburn station, some 500 or 600 feet of 22-inch iron pipe is being made, designed for carrying the water of the lower Bear River ditch across Little Dry creek, now crossed by a flume. So far as we can learn the company is sparing neither pains nor expense to put their ditch property in a first-rate and durable condition. They have established an office here and put the management of affairs in first-class hands. All of which indicates a steady water supply for consumers and prosperity for the proprietors.

SONOMA.

MT. JACKSON AND ITS MINES.—*Russian River Flag*, Sept. 21: The Mt. Jackson mine has been worked since 1873, but owing to the soft nature of the ore and consequent difficulty of extracting the mercury, it has not until recently been a paying mine. Last April the erection of three Eames furnaces was begun. They are completed and have been running a short time with marked results. After three years of heavy expense the Mt. Jackson has become one of the most profitable mines in the country. The reduction works consist of a large three-story building, with sheds and wings, and contain a 35 horse power engine, a crusher, pans, pumps, etc., and the three Eames furnaces. The ore from the mine is dumped on a level with the top of the building, and, passing through the crusher and furnaces, comes out in dust and quicksilver at the bottom. The capacity of the three furnaces as now worked is 18 tons every 24 hours. And with them it is found profitable to work one per cent. ore, even at the present low price of mercury. As but little of the ore falls below two per cent., and much of it averages five, large profits must accrue to the shareholders. There are at present employed about the mine and furnaces only 13 men. There are 2,400 feet of tunnels, 146 feet of shaft and four ore chambers; the largest chamber is 130 feet long, 18 feet wide and 18 feet high. Rich ore appears on every hand. A curious feature is that the walls are in many places covered with crystals of magnesia and epsom salts, some of them colored a dark green from the presence of verdigris.

THE GREAT EASTERN.—This mine, which adjoins the Mt. Jackson, is of the same character as the latter. The company has one Eames furnace, which is worked up to eight tons every 24 hours. This work on their present grade of ore averages two flasks a day. There are employed in the mine and mill about 20 hands. Ore enough is on the dump to supply the furnace a year. The mine has 1,800 feet of tunnels, 120 feet of shafts and an "uprise" of 60 feet.

TUOLUMNE.

MINING NOTES.—Tuolumne *Independent*, Sept. 23: The Ferguson mine has again started up and the company are to run a new tunnel. The Marks & Darrow is erecting a wheel to crush their quartz, with arastras attached. A five-stamp mill is being erected on the Jones & Woodman mine. A small affair for a large vein with plenty of good ore in sight. The Soulsby mine is yielding beautiful ore from the shaft. Buckets full are being brought to the surface, some of which is liberally stuck together with gold. The parallel vein adjoining the Soulsby is being developed by Glasson & Co. The rock on the dump looks well, with the same characteristics as the sister vein. There is a mine in this county where they are taking out from twenty to twenty-five thousand dollars monthly. This property not being for sale, we are admonished not to say anything about it. Therefore, not wishing to tell tales out of school, we keep our mouth shut.

WORK PROGRESSING.—*Union Democrat*, Sept. 23: Work on the Jones & Woodman mine in this county progresses rapidly, and 400 tons of the best kind of rock have been extracted and is now ready for milling.

Nevada.

WASHOE DISTRICT.

IMPERIAL CON.—Gold Hill *News*, Sept. 21: Everything running all right again. The new shaft to replace the broken one of the pump engine was put in place and started running on Friday evening last. It operated finely and the water was reduced at a lively rate. Owing to the energetic efforts brought to bear in the case the water was kept from rising high enough to do any particular damage. It did not get into the winze below the 2000-ft level. The bulkheads which were put up to defend against the water have been taken down, and everything is now going ahead regularly as before the accident. No damage was done to the mine.

NORTH CON. VIRGINIA.—The new machinery was started into operation last Friday and is running finely. Sinking the shaft deeper is resumed, the pump handling the water with perfect ease. The shaft will be continued to the 1500-ft level, 500 feet below the present lowest level, and a good paying mine is expected to be developed at that point.

OPHIR.—Daily yield, 300 tons. The ore breasts of the 1800 ft level are looking and yielding well, as usual, with no particular change to note. Some very rich ore comes from the eastern portion of this level. The cross-cut west near the Mexican line is pushing ahead in low grade ore, and the main incline is sinking at a good rate of progress.

BULLION.—The various drifts at the 1400, 1500 and 1600-ft levels are all being pushed ahead as usual, with encouraging prospects. Nothing doing at the lower levels, owing to too much water and bad air.

MEXICAN.—Northwest drift at the 1465-ft level is still running in fine looking vein matter, with streaks and bunches of low grade ore. Continued improvement is met with as the drift advances. Bottom of the winzs below this level shows good ore.

SOUTH END.—Shaft down 237 feet. The 200-ft station is completed, and when the shaft reaches the 300-ft level another station will be opened.

LADY BRYAN.—Shaft sinking lively. A portion of the new machinery has arrived and the balance soon will, as it is all paid for, and has to be delivered within 30 days.

OVERMAN.—Drifts north and south at the 1,200-ft levels are steadily advancing and both are in excellent looking quartz.

BELCHER.—At the 700-ft level the drifts both north and south are advancing well in favorable ground.

ROCK ISLAND.—The water being all out, work is driving ahead at the 650 and 750-ft levels under the most favorable auspices.

ALPHA.—The Imperial flood having subsided, the drift is being pushed ahead again, and will connect with the Imperial drift very soon.

AMAZON.—Shaft down 163 feet, with bottom in clay and quartz and showing streaks and bunches of low grade ore.

SUTRO TUNNEL.—Face of the header in porphyry with seams of quartz and clay. This material works very favorably. Total length of tunnel last evening, 14,390 feet.

SAVAGE.—The water is gradually being reduced, although occasional interruptions and delays occur, owing to repairs found necessary in the incline.

GLOBE CON.—The main drifts both north and south at the 300-ft level being pushed ahead, both in excellent vein matter, with fine looking streaks of quartz.

SUCCOR.—The masonry foundations for the heavy new surface machinery are being urged forward to completion as fast as practicable.

WEST BELCHER.—Plenty of pay ore coming from the up-raise as well as from the main drift at the 300-ft level. Dumps pretty well filled.

BEACH & PAXTON.—West cross-drift at the third level pushing ahead in good ore formations.

RESURRECTION.—This mine is a relocation of the old Santa Rita, so well known in the early history of the Washoe silver discovery and consequent excitement. It is situated in Spanish ravine, directly west of the great bonanza of the California and Consolidated Virginia, and some 200 or 300 yards up the ravine from the old Ocle company's tunnel and ledge. The Santa Rita was considerably worked in the early times, a tunnel over 900 feet long being run into it, developing a ledge 123 feet in width of the regular white Comstock ore. Drifts north and south were also run in the ledge 150 feet or more in length, and a large amount of low grade ore found, principally in the 30 feet lying next to the east wall. Considerable of it was extracted and milled, but it only gave an average of $8 or $10 per ton, which, with the imperfect milling appliances of those days, would not pay, therefore the mine was abandoned and remained so until a year or so ago, when the present company owning it obtained possession, relocated it under the mining laws of the State, perfected their title, and being principally composed of San Francisco and New York capitalists they are well prepared to develop and work the mine for all it is worth. They commenced active practical operations about a month ago and have cleaned out the old tunnel and drifts.

CALIFORNIA.—Daily yield, 550 tons, from the 1500, 1550 and 1600-foot levels. The various ore breasts and stopes continue looking and yielding finely as usual at all points. The 1600-foot level is looking especially well in the south drift and also in the drift or crosscut from the main south drift. A little over 300 tons per day is being hoisted through the O. & O. shaft and the balance through the Con. Virginia shaft; none through the Ophir at present. The new mill of the company is doing excellent work. The winze from crosscut No. 5, at the 1500 to the 1600-foot level is completed and will ultimately connect with the crosscut east at the last mentioned level which is running to meet it. The drifts and winzes at the 1400-foot level are being put in good repair for active ore production service. The C. & O. shaft is sinking at the rate of two feet per day and is now 112 feet below the 1500-foot station. The flow of water continues very strong, keeping the pumps pretty busy. Another station for a pump hoist is being cut out below the 1500-station, and a branch from the side track of the Virginia Truckee railroad is being completed to the shaft in order to bring requisite supplies of timber, lumber, etc., and transport the ore to the mill. The machinery works most excellently in every respect.

JUSTICE.—Daily yield 150 tons, the increase being allowed by the addition of the Pioneer mill, which has been set to work on ore from this mine since last week's report, making five mills in all, viz.: the Sherman, Excelsior, Woodville, Douglas and Pioneer. The ore comes from the 400, 500 and 600-foot levels, and also from the main drift at the 800-foot level, taken out in running the drift. The ore breasts in the upper levels mentioned are yielding some very rich ore, and there is plenty of it in sight. Another mill can be supplied very easily, and will be secured and set to work soon. No notable change to report in cross-cuts Nos. 1, 2 and 3, at the 800-foot level. They show good milling ore, with good promise of something better. At the 1000-foot level the northwest crosscut struck a heavy increase of water last evening, and the main south drift at the same level also tapped a strong increase of water. This caused a temporary suspension of work at that

level, bnt tbe water is reduced again, and work is resumed as before. Sinking the main incline was also suspended on account of this flood of water, but this difficulty being disposed of, sinking will be resumed forthwith.

CON. VIRGINIA.—Daily yield about 450 tons. It comes from the 1400, 1500 and 1550-foot levels, and keeps the Bacon, Trench and Brunswick mills steadily running. The Consolidated mill has not started working on ore from the mine, but will do so in about two weeks. It is needed, as the water supply of the Brunswick, as well as other mills on Carson river, is getting rather short. Tbe varions ore-producing sections of the mine are looking finely and opening up more extensive resources. At the 1550-foot level this is especially the case, the eastern workings showing decided improvement, and considerable ore is now being hoisted from that level, the repairs to the station and shaft being completed. Nothing is being done at the 1700-foot level, owing to the retimbering of the douhle winze above the level.

HALE & NORCROSS.—Water redneed 145 feet. Owing to breakage of compressor have had to bail or raise the water up the incline to the pump tank with the giraffe. The compressor will he repaired and the incline pump working again this evening. At the 400-foot station a large balance hob for tbe pump is heing pnt in. The incline is found to he in excellent order, notwitbstanding its heing so long submerged. Tbe heat is very great at present, hut hy the first of next week tbe 1900-foot level will be probably reacbed, when a good air circulation will be estabiished tbrough tbe main drift at that point.

AMAZON AND GLASGOW.—Waiting for tbe pump to arrive. Meanwhile the heavy flow of water from the ore vein developed at the 400-foot level is kept down by tbe haling tanks. As soon as the pump arrives it will be put in plsce and tbe new machinery hrought to bear in the matter

JULIA.—Main drift east at the 1800-foot level advancing well, through soft porpbyry, quartz and clay; more quartz is coming in; no increase of water. Tbe south drift at this level is showing a fine and most promising body of quartz, taking the whole face of the drift.

SILVER HILL.—North drift at 444-foot level making good steady advancement, with the face in favorahle vein material.

BELCHER.—Daily yield, 300 tons of ore from the old ore sections. Soutb drift at the 1,500-foot level steadily going ahesd, with no new features of interest to report. At the 1600-foot level the north drift, and also the drift east, are being pushed abead, showing no particular change wortb relating.

KOSSUTH.—Streaks of good ore are getting larger and plentier in the east crosscut at tbe 500-foot level.

SIERRA NEVADA.—The water at tbe 1750-foot level continues to obstruct operations at tbat point.

CROWN POINT.—Daily yield 60 tons, keeping the Rhode Island mill steadily running. The main south drift at the 1700-foot level bas completed its connection with tbe Belcher and Crown Point air and pump-shaft, giving a valuable and mucb needed resource in tbe way of ventilation.

SOUTH COMSTOCK.—Work in this valuable mine is to be resnmed shortly, after a rest of a few months. The old line of operations will not be followed, but a new programme pursned. A drift is to he started from the 300-foot level to cut and explore the east ledge, the west ledge being pretty well prospected hy the former workings.

FLORIDA.—Shaft sinking at the rate of tbree feet per day. Bottom in hard blasting ground composed of trachyte conglomerate. No increase of water. Northwest drift at 400-foot level pushing ahead at the rate of three feet per day with face in hard vein matter, mixed with more and more quartz. No west wall as yet. The machinery works well, and the pump is raising out the water at the rate of 30,000 gallons per hour.

GOULD & CURRY.—The retimbering and repairing of the shaft goes forward slowly, owing to tbe caving nature of the ground and the care necessary to be exercised in consequence. The joint winze below the 1600-ft level, at the Savage line, is down 346 feet and getting along finely in good sinking ground.

PROSPECT.—The drift west at the 400-ft level is being pushed ahesd at the rate of four feet per day, passing tbrough hard porpbyry. It is expected to reach the front ledge very sbortly, and will be continned through to the back ledge where the main ore body is.

NORTH CARSON.—Sbaft down 335 feet, with bottom in hard rock with seams and hunches of quartz and clay. Tbe ore body at the 300 ft level is showing splendidly and improves constantly as farther sought into. It stands at an angle of 45 degrees and tbe shaft will pass tbrough it in sinking deeper. It is within six feet of the shaft now.

YELLOW JACKET.—At tbe 2040-ft level the south drift is in 128 feet from tbe east winze; face of same in quartz and porpbyry.

TROJAN.—The shaft is in very favorable veln matter. Have sunk 80 feet since sinking was resumed, and for abont half that distance the south side or the shaft passed tbrougb a body of good milling ore, hut it dipped away and passed out of the shaft.

BALTIMORE AND AMERICAN FLAT.—Drifts both nortb and south at tbe 1050-ft level pushing abead with some improvement in the south drift, more and better quartz coming in at the face.

PHIL SHERIDAN.—Shaft 330 feet deep to-day. Bottom in quartz and porphyry, mixed, hard, but blasting well and working favorably. Will cross-cut the ledge soon, from the sbaft.

COSMOPOLITAN.—The stopes and breasts of the upraise are yielding considerable good milling ore, and tbe winze below the main tunnel or adit level is now down 84 feet, in good ore all the way.

SUPERIOR.—The drift west at tbe 160 ft level is now in 40 feet and will have to go ahout 50 feet further to reach the ledge. Water slacking off considerably. Drift running in a mixture of porpbyry, clay and streaks of quartz.

BERAIN.—During tbe week some very good ore bas heen met with at the bottom of the incline in sinking, and the prospects for a fine paying bonanza are excellent. It seems to dip away to the north, and a drift is to he run to more fully ascertain its value.

BALTIC CON.—Material in face of main west drift soft and easy to work, being composed of porphyry, clay and quartz. Large streaks of low grade ore continue coming in.

CALEDONIA.—Sinking the shaft progresses favorably, and good work is being done. Cutting out tbe tank pit at the 1500 ft level for the plunger pump.

BUCKEYE.—Tbe pumping arrangements have been enlarged and rendered more effective, and sinking deeper can he resumed wbenever it is tbought expedient.

WARD.—Sbaft down 623 feet to-day. No tronble from water yet.

UTAH.—Slnking the sbaft is temporarily snspended in order to allow the work of cutting ont a tank and hoh pit for the pump to go forward to the best advantage.

CHOLLAR-POTOSI.—Daily yield from 90 to 100 tons. Average assay, $30. No new ore developments to report.

BEST & BELCHER.—The work of enlarging and retimbering the donhle winze, cntting out and retimhering the station at tbe top of the winze, enlarging the east drift and resetting the engine is progressing at a good rate.

NEW YORK.—Pump tsnks at tbe various stations opened, and raising the pump shaft going abead lively, with tbree shifts of men.

NIAGARA.—Sbaft down 467 feet to-day. Rock softer at bottom, so that good work is heing done.

MINT.—Shaft 1,243 feet deep to-day. Very good ore indications at bottom of shaft.

EAST JUSTICE.—Bottom of shaft in favorable working ledge matter, allowing of good progress in sinking.

To Encourage the Growth of Timber.

EDITORS PRESS:—Will you publish the act referred to in your article "Important to Settlers" in the PRESS of August 12th? We are all on Government land, and if the act will help us, although not on the prairies, we would like to avail ourselves of it.—R. W. WATERMAN, San Bernardino, Cal.

The following is the act referred to as published in Dewey & Co.'s pamphlet on the "Public Lands of California and the United States Land Laws." The following, taken in connection with the amendment to which our correspondent refers, comprises the law as it now stands for the encouragement of timber growing:

Be it enacted by the Senate and House of Representatives of t e United States of America in Congress assembled, That the act entitled "An Act to encourage the growth of timber on Western prairies," approved March 3d, 1873, be, and the same is hereby, amended so as to read as follows: That any person who is the head of a family or who has arrived at the age of 21 years, and is a citizen of the United States, or who shall have filed his declaration of intention to become such, as reqnired by the naturalization laws of the United States, who shall plant, protect and keep in a healthy growing condition for eight years, 40 acres of timber, the trees thereon not heing more than 12 feet apart each way, on any quarter section of any of the public lands of the United States, or 20 acres on any legal subdivision of 80 acres, or 10 acres on any legal snbdivision of 40 acres, or one fonrth part of any fractional subdivision of land less than 40 acres, shall be entitled to a patent for the whole of said quarter eection, or of such legal snbdivision of 80 or 40 acres, or fractional subdivision of less than 40 acres, as the case may be, at the expiration of said 8 years, on making proof of such fact by not less than two credible witnesses: *Provided*, That not more than one-qnarter of any section shall be thus granted, and that no person shall make more than one entry nnder the provisions of this act, unless fractional subdivisions of less than 40 acres are entered, which, in the aggregate, shall not exceed one quarter section.

SEC. 2. That the person applying for the benefit of this act shall, npon application to the register of the land district in which he or she is about to make such entry, make affidavit before the register, or the receiver, or some officer anthorized to administer oaths in the district where the land is situated, who is required by law to nse an official seal, that said entry is made for the cultivation of timber, and npon filing said affidavit with said register and said receiver, and on payment of $10, he or she shall therenpon be permitted to enter the quantity of land specified; and the party making an entry of a quarter section under the provisions of this act shall be reqnired to hreak 10 acres of the land covered thereby the first year, 10 acres the second year, and 20 acres the third year after the date of entry, and to plant 10 acres of timher the second year, 10 acres the third year, and 20 acres the fourth year after date of entry. A party making an entry of 80 acres shall break and plant, at the times hereinbefore prescribed, one-half of the quantity reqnired of a party who enters a qnarter section; and a party entering 40 acres shall break and plant, at the times hereinbefore prescribed, one quarter of the quantity required of a party who enters a quarter section, or a proportionate qnantity for any smaller fractional snbdivision: *Provided, however*, That no final certificate shall be given or patent issned for the land so entered until the expiration of eight years from the date of such entry; and if at the expiration of such time, or at any time within five years thereafter, the person making such entry, or, if he or she be dead, his or her heirs, or legal representativea, shall prove, hy two credible witnesses, that he or she or they have planted, and, for not less than eight years, have cultivated and protected such qnautity and character of timher as aforesaid, they shall receive a patent for snch qnarter section or legal subdivision of 80 or 40 acres of land, or for any fractional qnsntity of less than 40 acres, as herein provided. And in case of the death of a person who has complied with the provisions of this act for the period of three years, his heirs or legal repreeutatives shall have the option to comply with the provisions of this act, and receive, at the expiration of eight years, a patent for 160 acres, or receive without delay a patent for 40 acres, relinquishing all claim to the remainder.

SEC. 3. That if at any time after the filing of said affidavit, and prior to the issuing of the patent for said land, the claimant shall abandon the land, or fail to do the breaking and planting reqnired by this act, or any part thereof, or shall fail to cnltivate, protect and keep in good condition such timber, then, and in that event, such land shall be subject to entry under the homestead laws, or by some other person under the provisions of this act: *Provided*, That the party making olaim to said land, either as a homestead settler or nnder this act, shall give, at the time of filing his application, snch notice to the original claimant as shall he prescribed by the rules established by the Commissioner of the General Land Office, and the rights of the parties shall be determined as in other contested cases.

SEC. 4. That each and every person who, under the provisions of the act entitled "An Act to secure homesteads to actual settlers on the public domain," approved May 20th, 1862, or any amendment thereto, having a homestead on said public domain, who, at any time after the end of the third year of his or her residence thereon, shall, in addition to the settlement and improvements now required by law, have had under cultivation, for two years, one acre of timber, the trees thereon not being more than 12 feet spart each way, and in a good thrifty condition, for each and every 16 acres of said homestead, shall, upon due proof of snch fact by two credible witnesses, receive his or her patent for said homestead.

SEC. 5. That no land acquired under the provisions of this act shall in any event become liable to the satisfaction of any debt or debts contracted prior to the issuing of certificate theretor.

SEC. 6. That the Commissioner of the General Land Office is hereby reqnired to prepare and issne such rules and regulations, consistent with this act, as shall be necessary and proper to carry its provisions into effect; and that the registers and the receivers of the several land offices shall each be entitled to receive two dollars at the time of entry, and the same snm when the claim is finally established and the final certificate issued.

SEC. 7. That the fifth section of the act entitled "An aot in addition to an act to punish crimes against the United States, and for other purposes," approved March 3d, 1857, shall extend to all oaths, affirmations and affidavits reqnired or anthorized hy this act.

SEC. 8. That parties who have already made entries nnder the act approved March 3d, 1873, of which this is amendatory, shall be permitted to complete the same upon full compliance with the provisions of this act.

Approved March 13th, 1874.

Farm Machinery.

One of the greatest leaks in farm economy may be found in the neglect into which machinery falls when the immediate time for its use is passed. We doubt not that many a reaper and header may be found to-day where Putnam left his plow, just in the place where they were last nsed. It may be permissable, when one's country calls, to leave the plow in the furrow, hnt in times of peace and leisure to leave a valuable farm tool in the open weather is a careless regard for valne which is not economical, to say the least of it.

This subject has received quite a generous and vigorons handling from Eastern agricultural speakers and writers for years. The result has been a more general housing of machines, although there is still room for improvement. We do not have the Eastern winter; the snow does not whirl around the abandoned separator, nor apply a heavy compress to the plow and harrow in the fence corners. But we have something which can he regarded as hardly less rninous to exposed machinery. The continued moistnre of the rainy season is an insidious foe to both the wood and iron of the implement.

The farmer uses machinery which far exceeds in cost the tools of the common mechanic, and yet the mechanic would rise at midnight to save a handsaw from exposure, while the thonghtless farmer will allow all his harvesting machinery, which cost him hundreds of dollars, to lie a twelvemonth subject to the disintegration of the elements. These things onght not to be so.

As a sample of the care that machinery should have on the farm we quote from the *Canada Farmer* the following recommendations for storing a reaper: "Not only should the reaper and mower be protected from the alternations of weather, that is, kept in an enclosed place, the harn, shed, or, better still, an implement honse erected for the purpose, but the manner and condition in which they are laid away must be very carefully attended to as well, it their futnre usefulness is expected or desired. First ot all, then, let them be well cleaned and dried, observing to pick away all tnts or blades of grass that may have become entangled amid the iron gearing; for wherever these are found, moisure is not far off; and moisture, iron and air in contact, mean simply oxidation or rust.

"Remove the cutter har. This is hy far the better plan, for it ohviates the sagging and twisting which usually follow either a folding np of the bar, or the more common practice of letting it lie in cntting order on the ground. Wipe every portion of the iron-work perfectly clean. For this pnrpose common coal oil is very serviceable to loosen and dissolve any oil that may have caked about the joints or axles. Dry thoroughly, and give the whole a light coat of good sweet oil. The wood-work may be treated in the same manner with the best results. The whole job may be accomplished in an honr or so, and at an expense ot abont ten cents, yet hy this hour's labor and insignificant expenditure at the proper time, yon do more to preserve yonr machine in good order than could be secnred for twenty times the amonnt had it been left, as so many are, uncared for and exposed." This advice of onr contemporary will apply to nearly all of the more complicated and expensive of farm machines. We trust that nsefnl hints may he taken from it hy any who may need them.

LATEST advices say that the rich diggings recently sirnck on Williams creek (British Columbia) were accidently discovered by the Well-Mary Anne (Chinese) hydraulic company, and are 1,000 feet hack in the hill on the east side of the creek.

Some Singular Phenomena in the Florida Mine.

A few days since the Virginia *Enterprise* reporter accompanied Superintendent Daly to the Florida and took a run through the mine. The location is an old one, having been made in 1859. It was originally known as the Pony Express. The original developments were made by running a tunnel some 500 feet into the hill. This struck the ledge about 280 feet from the month and was discontinned when the west wall was reached, showing a vein of promising quartz ot nnusnal breadth. This body of qnartz contains large amonnts of low grade ore and in places yields assays as high as $80.

The vein having been thus prospected the present shaft was located some 25 yards north of the tunnel and has been sunk a little over 400 feet. A drift was sent ont from the 400-foot level to prospect the ledge. After rnnning abont 140 feet through a mixed formation, composed principally of trachyte, the clay wall was reached. This is as fine a wall as any on the Comstock. Passing through this, a formation of black dyke is enconntered which is permeated all through by quartz in veins which run from the thickness ot a sheet of paper np to one and one-half inches. In the largest veins and bunches silver is fonnd, some of them giving liheral assays.

Since striking the dyke the drift has been continued 400 feet without yet striking the west wall of the formation. As was very natural, the flow of water therefrom was very strong. There have also been various drifts projected on this level, bnt a uniform formation has been everywhere encountered. This has a nearly polar trend and a dip of abont 35 degrees to the east. It is very evident that there is nothing to pay for work on this level exoept that the extent and "behavior" of the vein may be determined by reaching the west wall, and for this purpose only need tbe drift be continued.

The wanderings on this level have, however, not been without their value. Something like a year ago it will be remembered that water was struck and not a little difficulty enconntered in pursning the work. An examination of the place where this occurred is very interesting. While pushing the drift ahead, the dyke flow broke np through the floor of the drift, and for a time nothing could withstand the upheaval. The pressure was, of course, from below, and so great that 12 by 12 timbers were broken like pipe stems. The flow was of slum and brought with it some fine specimens of ore, which yielded very large assays. This flow continned till 1,100 car-loads were taken out, and then the drift was turned to one side, as the supply showed no signs of ceasing.

This phenomenon, taken in connection with the snrface indications all throngh the section, and the quar z and vein matter in the tunnel, is fnll of interest. The section shows abundant evidence of violent volcanic action. Even near the tops of the mountains in the vicinity are to be found vast masses of lava, deposited there by upheavals from below. Running along near the mine is a ridge of trachytic rock similar in formation to that enconntered in the drift before reaching the clay wall. The conclusion is inevitable, that after the regular deposition of country rock, in a fissure of which the quartz formation in the ledge was deposited, a subsequent npheaval displaced the vein and injected the black dyke. As this oooled and cracked, the pressnre from below was so great as to fill all the seams with what has produced the quartz veins permeating the whole body.

The original vein should then surely be found somewhere in the vicinity, or more probably lying qnietly and intact below this surface disturbance. Its natnre is snfficiently indicated hy the solid snbstances hronght np by the flow. That it contains mineral is evidenced by the ore hronght np. Its swelling nature is indicated hy the npward pressure, which broke through the floor of the drift and could not he controlled, and by the fact that a piece of the vein matter hronght ont, when exposed to the air, increases in size twofold. All can judge of the nature of these indications for themselves. All the phenomena connected with the drift go to show that at the point of npheaval the work cut very near the connecting line between the dyke and the ledge, which is pressing upward from below. This is to he tested, for the shaft is to be dropped on down immediately and another exploration made from a lower level.

THE earnings of the Central Pacific railroad in Angnst were $1,689,000. For the first eight months ot the year the total earnings amounted to $11,257,166, against $10,999,422 in the same period ot time last year. In 1875 they had 1,213 miles of road in operation. The gross earnings per mile were $14,032.16 and the operating expenses per mile, $6,115.

QUICKSILVER.—The Colusa *Sun* gives some information as to the cost of produoing qnicksilver in that county: At the Abbott mine last year it cost 31.4 cents per pound to produce the article, inclusive of the first cost of the furnace. It is thought the cost of production oan be reduced to 25 cents a pound. The market price of the article is about 45 cents.

A BIG STRIKE.—The unusnal spectscle of Chinese striking for higher pay is afforded at Oreana district A number of them employed at the Hnrricane smelting works hncked and quit work, in consequence of whiob the furnaces had to stop.

The Wheeler Expedition.

The Virginia *Enterprise*, in speaking of the advent of a part of the Wheeler expedition to their camp near Virginia, says:

The party is composed of Lieutenant T. W. Symons of the engineer corps; Dr. F. Kampf, astronomer; Antone Karl, topographer, and Louis Seckles, meteorologist. Simon B. Cameron was left for the time being in Sutro, but will join the others very soon. This is the central party of the expedition and are particularly engaged in triangulation, preparatory to making a contour map of this entire section of country, with curves 25 feet apart. This is to include Virginia, Gold Hill, Silver City, etc. The instructions given are to make this map very accurate, in fact as perfect as possible. The initial steps have already been taken and

A Base Line Established,

Four and one-quarter miles long in the valley on the old emigrant road, near Sutro. The method of its measurement is new and the invention of Dr. Kampf of the expedition. The old method was by alignment of posts with a theodolite, leveling the tops and then measuring by using three poles of known length, two being left in place and the third or last one being taken up and carried on ahead each time. Dr. Kampf uses a rod of fine wood, thoroughly seasoned, and compared every night and morning with a normal rod of known length at a certain temperature. The measuring rod is supplied with a level for showing when it is exactly horizontal and verniers at each end. In making the measurement three small iron stands are used, by moving which along the line the measurement is taken exactly.

Ten Mountain Stations

Have been already occupied, including Mount Davidson, which is the tenth. The distance between the stations is accurately determined by means of this base line. Its length and position being accurately determined, the distances and positions of these stations are calculated therefrom by means of the system of triangulation. These mountain stations being then placed and distanced, are again used as points of observation for new sections and so on, the adjoining parties of the expedition profiting by them in the same manner as this central party. The party yesterday afternoon and last evening occupied

The Astronomical Station on the Divide,

The position of which was fixed by Lieut. Wheeler's expedition some time ago. From this a base line is to be established to some point on Ophir hill, which is to be used for all future mining surveys and is also to be connected with the base already established, as above described, in the valley below. This will be of immense value to this section of country and especially to those engaged in developing our mining interests. The day has already come when the fraction of an inch of ground on the Comstock is worth contending for in the courts, and anything which will in future tend to establish exact boundaries or determine existing rights is of incalculable value. Lieutenant Symons is also instructed to collect all the

Information in Regard to the Mines

Which he can obtain while in this section: The exact location and extent of the Comstock so far as traced, the statistics as to the amount of its yield in gold and silver; the amount of rock and water that has to be raised and the cost of the work, the nature of the machinery used, its description, and the improvements which are being or have been introduced, the amount and cost of the fuel and timber used in the mines and in connection with the mining and milling of ores, etc.—all are wanted by Lieutenant Symons, and for the purpose of obtaining these he

Will Wait Upon our Mining Superintendents.

Lieutenant Symons is a man who will be popular among our mining men. He is very quiet, plain and unassuming, but possesses energy and determination—qualities essential to the success of an expedition such as the one upon which he is engaged. He is withal a young man, having graduated from West Point in 1874. He took the honors of his class of 113, and was the only one of the whole who was immediately transferred to the engineer corps, always regarded as the highest branch of the service. The information which he collects as to this section of the country is to be published by the Department at Washington. This affords an opportunity to spread correct information as to our mines, which if itself should open every avenue of information to the gatherer. We bespeak for Lieutenant Symons a hearty welcome.

The Other Branches of the Expedition

Are at work in this vicinity and further east. The whole is under the command of Lieutenant George M. Wheeler, of the United States army engineer corps, who is operating near Lake Tahoe with Lieutenant McComb. Another is north of Reno. The one to the east is beyond the 40-Mile desert, in the vicinity of Austin. The rendezvous camp is at Carson. Operations will be carried on till the severity of the season drives the expedition from the mountains. There are two other expeditions of a similar nature in the field, one in Colorado and one in New Mexico; but these travel all the time and are making topographical maps of the country only. This is all the meager appropriations of Congress will allow them to do.

Useful Information.

Interesting Facts About Grindstones.

A writer in the *Iron Age* makes a classification of grindstones which will furnish interesting information to many a mechanic. The English, Nova Scotia and Ohio grindstones are the principal kinds in use, but each of these sorts are subdivided into an endless variety of sizes and grits.

English Grindstones.

New Castle.—Yellow color and sharp grit; the fine soft ones for grinding saws, and the coarser and harder ones for rad irons and springs, pulleys and shafting (instead of turning), and for bend and face stones in nail works, and for castings (dry grinding).

Wickersly.—Grayish yellow color; for grinding saws, squares, bevels, and cutlers' work generally. A very soft grit to avoid taking out the temper.

Liverpool (or Melling).—Of a red color and very sharp grit; for saws and edge tools generally. An excellent grit for sharpening axes in ship yards.

Nova Scotia.—Blue or yellowish gray color, and of all grits, from the finest and hardest to the coarsest and softest; the large ones for grinding rad irons and hinges, springs and edge tools; the medium and small sizes for machine shops and for sharpening edge tools generally.

Bay Chaleur, N. B.—Of a uniform blue color, and soft, sharp grit; for manufacturing table cutlery, and is admirably adapted for machinists' tools, and for sharpening edge tools generally, when a fine edge is required.

Ohio.

Berea.—White color, fine and sharp grit; for sharpening edge tools, generally.

Amherst, (Black River).—Brownish white color, soft, loose grit; for edge tools, and the very soft ones for saws.

Independence.—Grayish white color, and coarse sharp grit; for grinding springs and files, and for dry grinding of castings.

Massillon.—Yellowish white color, coarse, sharp grit; for edge tools, springs, files and nail cutters' face stones, and for dry grinding of castings.

Huron (Michigen).—Of a uniform blue color, and fine, sharp grit; good for sharpening tools when a very fine edge is required.

Glass Cutters' Grindstones, of New Castle, Warrington, Craigleith and Yorkshire grits; for checkering, mitering, fluting and for punty stones.

Cutlers' Grindstones, of New Castle, Nova Scotia and Wiokersly grits; made to order, of any size.

Shank Stones; for table cutlery.

Courriers' Rubstones of New Castle, Nova Scotia and Ohio grits; for first and second stones; and Scotch Water of Ayr, Welsh and Hindosten, for cleering stones.

Scythe, Oil and Whet Stones, Ouachita, Arkansas, Orange and Scotch Water of Ayr stones and hones, of all shapes. Shoemakers' rubbers, and scythe stones of all sizes.

Judging Steel by the Eye.

At a meeting of the American association for the advancement of science, in Buffalo, a peper on "The Relations of Structure, Density and Chemical Composition in Steel," was read by John W. Langley. It has long been known to practical men, says the *American Manufacturer,* that the appearance of the fracture of steel bears some relation to its mechanical properties as developed in the machine shop. It has been further known in a general way that this appearance was connected with the quantity of carbon in the metal. The researches embodied in this paper extend over a period of two years, and show, first, that steel can be selected by ocular inspection alone with a high degree of precision, and that differences of less than seven-hundredths of one per cent. of carbon can be certainly known by the appearance of the freshly broken ingots. Twenty ingots, manufactured by Messrs. Miller, Metcalf & Parkin, of Pittsburg, formed the material for these determinations. Second, it was shown that in general the specific gravity decreases in proportion with the increase of carbon, though there are some apparent exceptions to the rule; and third, that when the metal is hardened by being plunged into water the density is less the greater the heat to which the specimen is subjected. The paper was accompanied by extensive tabulated reports. In conclusion it was asserted that the time had arrived when the eye had very nearly become the rival of chemical analysis in this branch of metallurgy.

Imitation Marble.—Carl Boschau says that if a statue, made of plaster of paris or *papier mache,* be coated with thick white dammar varnish, and then dusted with pulverized glass, it will have, when dry, the appearance of alabaster. If it be afterwards varnished a second time, and dusted with coarsely pulverized white glass or mica (*marienglas*) and again dried, it will be a very successful imitation of Carrara marble, especially if the marble veins be first traced with some delicate blue pigment. This method of preparation follows that of nature, for alabaster consists of very small crystals of sulphate of lime, and Carrara marble of somewhat larger crystals of carbonate of lime, which in reflected light glistens like white sugar. This effect is obtained with perfect deception by the brilliant white glass in coarse powder.

Combustible Silk.

The *Polytechnic Review* says: "It seems to be well established that black-dyed silk is liable to a similar alteration (i. e. spontaneous ignition) although its real cause has not yet been satisfactorily ascertained." Since the appearance of the contribution in question, a fact has come to the knowledge of the writer, that in all probability will throw some light on the subject, as will be perceived from the item herewith reproduced from *Harper's Annual Record of Science and Industry,* for 1875: viz: The debasement of silks by foreign admixture, if we may infer from the comments of journals devoted to textile interests, has of late reached such a hight as to promise shortly to rival that of a class of cotton goods which have added largely to the notoriety, if not to the fame, of one of the manufacturing centers of England. A writer in one of the French journals shows that the weighting of black silks—which began with the modest aim of making up for the loss sustained in ungumming—is now carried to the extent of 100, 200 and 300 per cent. This increase of weight is effected by treatment with salts of iron and astringents, salts of tin and cyanides. The bulk is augmented proportionably to the weight. The same writer points out very clearly the evils attending this excessive adulteration. The chemical and physical properties of the silk thus treated are materially modified. What is sold as silk is, in reality, a mere agglomeration of heterogeneous matters devoid of cohesion, held together temporarily by a small portion of silk. The strength and elasticity of the fiber are likewise reduced. From being in its natural state one of the most stable of substances, and but slightly combustible, in its adulterated state it burns like tinder if touched by a flame. It is likewise affirmed to be liable to undergo spontaneous decomposition, and to absorb gases with the evolution of heat which sometimes lead to actual combustion. The adulterated silk when burning scarcely gives off the characteristic odor of animal matter.

Crystalline Surface for Wood, Paper, etc.—The *Practical Magazine* says that the following is the simplest method of giving paper and wood surfaces a crystalline coating. Mix a very concentrated cold solution of salt with dextrine, and lay the thinnest possible coating of the fluid on the surface to be covered by means of a broad, soft brush. After drying, the surface has a beautiful, bright mother-of-pearl coating, which, in consequence of the dextrine, adheres firmly to paper and wood. The coating may be made adhesive to glass by doing it over with an alcoholic shellac solution. The following salts are mentioned as adepted to produce the most beautiful crystalline coating, viz.: sulphate of magnesia, acetate of soda and sulphate of tin. Paper must be first sized, otherwise it will absorb the liquid and prevent the formation of crystels. Colored glass thus prepared gives a good effect by transmitted light.

Restoring Damaged Velvet.—The *Moniteur de la Sulud* published the following method for restoring velvet to its original condition. It is well known that when velvet has been wet, not only its appearance is spoiled, but it becomes hard and knotty. To restore its original softness, it must be thoroughly dampened on the wrong side, and then held over a very hot iron, care being taken not to let it touch the letter. In a short time the velvet becomes, as it were, new again. The theory of this is very simple. The heat of the iron evaporates the water through the tissue, and forces the vapor out at the upper side; this vapor, passing between the different fibers, separates those which adhere together in hard bunches. If the velvet were ironed after damping, an exactly opposite result would be obtained. It is therefore necessary that the substance should not come in contact with the heated iron.

Good Health.

Recipe for Curing a Taste for Liquors.—At the festival of one of our reformatory institutions a gentleman is reported to have said: "I overcame the appetite by a recipe given to me by old Dr. Hatfield, one of those good old physicians who do not have a percentage from a neighboring druggist. The prescription is simply an orange every morning half an hour before breakfast. 'Take that,' said the Doctor, 'and you will want neither liquor or medicine.' I have done so regularly, and find that liquor has become repulsive. The taste of the orange is in the saliva of my tongue, and it would be as well to mix water and oil as rum with my taste." The recipe is simple; and has the recommendation that it can do no harm even if it does no good.—*St. Louis Medical and Surgical Journal.*

Butter.—Is butter a food—that is, does it nourish and strengthen the body? Answer: Butter is a food quite as much as meat. Indeed, there is more strength stored up in an ounce of butter than two ounces of the best lean meat; but butter will not furnish material to build up the tissues of the body as bread and meat do. A man would starve on a butter diet in a very short time. Butter is a fat useful in the body to support animal heat and generate force, as coal and wood do under the boiler, and of some use in building muscular and nervous tissues.—*M. L. Holbrook.*

Diphtheria.

Several new cases of this disease have been reported during the week, says the Napa *Reporter,* and one death. Our leading physicians inform us, however, that the disease is of a remarkably mild type, yielding to treatment readily and easily, and that the patients begin to convalesce, as a general thing, within four or five days from the time of attack. Parents should observe the utmost care to prevent the spread of the disease, as a spell of bad weather may cause it to take on the intense form.

A letter from the East to a friend says: "I see from the *Reporter* that you have diphtheria in your town. You may recollect the wonderful success of the late Dr. J. J. Williams in treating this disease, a success considered little short of marvelous by his professional contemporaries. He considered the malady a blood disease, and treated it with intense doses of chlorate of potassa of iron, cutting out the false membrane at least twice a day with dilute muriatic acid, applied on a swab. I think the dose of chlorate of potassa is a tablespoonful every four hours. I don't know how much tincture of iron he gave, but it was a strong dose. Medicines are but half the treatment, however. Milk punch, egg-nogg, and champagne must be given in quantity, not only to paralyze and subdue the enemy but to reproduce the blood which seems to be decomposed and poisonous. Beef tea first and rich juicy steaks subsequently, also form an important link in the treatment. After the patient has commenced to convalesce, in fact is able to leave the house, the doses of chlorate of potassa must be kept up constantly and regularly; which is under the theory, borne out in too many instances in practice, that the enemy continues to lurk, and may gain strength and make a new attack, which will be more virulent than the first.

"Understand that the theory of the disease is that the blood is in an abnormal, poisonous condition, produced by a cause. The specifics to check and overcome that cause are chlorate of potassa and iron and the dilute muriatic acid swabbing, but whilst you are battling to subdue your enemy you must supply new strength to your patient, or you will lose the fight. That strength is new blood, which new blood you get through the milk punches, egg-noggs, champagne, beef tea and beef. This treatment is so well understood here, and has been so successful, that this disease, generally so alarming elsewhere, has lost many of its terrors. The practitioner who grapples with this disease should know that his dispositions must be made for a sharp, short and fierce encounter. He must neither give nor expect quarter; he must neglect no precaution, for his foe is as treacherous as he is formidable. You must overcome him early or he will overcome you. It is murder to temporize with this scourge for a moment."

"Chlorate of potassa is also a preventive. As soon as one child in a family is attacked give all the others this medicine."

Headache from Eye-Strain.—Dr. Weir Mitchell, in the *American Journal of the Medical Sciences,* observes that few but ophthalmic surgeons are aware of the need of interrogating the eye for answers to some of the herd questions which are put to us by certain head symptoms; and he wishes to impress upon the profession: (1.) That there are many headaches which are due indirectly to disorders of the refractive or accommodative apparatus of the eyes. (2.) That in these instances the brain symptom is often the most, and sometimes the sole, prominent symptom of the eye trouble, so that while there may be no pain or sense of fatigue in the eye, the strain with which it is used may be interpreted solely by occipital or frontal headache. (3.) That the long continuance of eye trouble may be the unsuspected source of insomnia, vertigo, nausea, and general failure of health. (4.) That in many cases the eye trouble becomes suddenly mischievous, owing to some failure of the general health, or to increased sensitiveness of the brain from moral or mental causes. Several illustrative cases are given, and the moral is: Be careful not to strain your eyes.

Extraction of a Living Insect from the Ear.—The *Archives Medicales Belges* relates the following case: A little girl, three years old, put an insect, "*bete a bon Dieu,*" into her ear. Sharp cries, agitation, convulsive symptoms, ensued; injections of water were made without result. The physician then conceived the idea of asphyxiating the insect by means of chloroform; he dropped four drops of chloroform upon a small piece of cotton which he introduced into the ear. Immediately the child ceased crying, and complained no further of any disagreeable sensation; the insect had become asphyxieted; an injection of warm water brought it away dead, and no further trouble ensued.

Cause of Decay of the Teeth.—Dr. L. B. Palmer, of New York, has been led to conclude, from a series of experiments, that the decay of the teeth is not, as is generally supposed, due to acids, but to alkalies (*Cosmos and Brit. Jour. of Dental Science*). With alkalies he reproduced decay of the teeth as it is seen in the mouth, but was unable to do so by acids. With the assistance of an electric current, acids simply acted on and destroyed the whole of the enamel.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	$2.00	$5.00
Half inch (1 square)...	$1.00	3.00	7.50	24.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing as extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:
Saturday Morning, Sept. 30, 1876

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Centennial at Philadelphia; Geological Outline of Santa Cruz Range, 217. Small and Large Mining Companies; Comstock Papers; California Mines, 224. Some of the Mines of Nye County; The Juniata, 225. Gems and Precious Stones; California State Fair, 228.

ILLUSTRATIONS.—Women's Pavilion, International Exhibition; Structure of the Santa Cruz Mountains, 217. The Juniata, 225.

CORRESPONDENCE.—Alta Mine and its Magnificent Machinery; Alpine County—Its Mines and Resources, Past, Present and Future, 218.

SCIENTIFIC PROGRESS.—The Color and Fragrance of Plants; New Meteoric Mineral, Daubreelite; A New Gas; Geographical; The Development Theory, 219.

MECHANICAL PROGRESS.—Steam Hammers; A Hill-Climbing Locomotive; The Saving in Steam Street Cars; Fountain Nozzle; Large Steam Hammer, 219.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 220.

MINING SUMMARY from various counties in California, Nevada, Arizona and Montana, 221-2-8.

USEFUL INFORMATION.—Interesting Facts About Grindstones; Judging Steel by the Eye; Imitation Marble; Combustible Silk; Crystalline Surface for Wood, Paper, etc.; Restoring Damaged Velvet, 223.

GOOD HEALTH.—Recipe for Curing a Taste for Liquors; Butter; Diphtheria; Headache from Eye-Strain; Extraction of a Living Insect from the Ear; Cause of Decay of the Teeth, 223.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 228 and other pages.

MISCELLANEOUS ARTICLES.—Work at Port Said; Captain Eads' Success, 218. To Encourage the Growth of Timber; Farm Machinery; Some Singular Phenomena in the Florida Mine; Quicksilver; A Big Strike, 222. The Wheeler Expedition, 223. Pacific Coast Awards at the Centennial, 225. State Fair Premium List, 228-9.

NEW ADVERTISEMENTS.

Talloch's Automatic Ore Feeder, S. F.; Saws, Emerson, Ford & Co., S. F.; Sacramento Boiler Works, Hall & Kelshaw, S. F.; Mariposa South Mining Co.—Sale; Union Stone Company of California—Sale.

FOUNDRY WORK AT SACRAMENTO.—Root, Nielson & Co., of the Union iron works, are quite busy in their foundry department turning out the iron for a large Howe truss bridge for the Sacramento river at Red Bluff; for the Odd Fellows' building at Reno, Nevada; and for the Tulare county court house, Visalia. This firm has also orders for lathes to be used in polishing large granite columns for Griffith's quarries at Penryn. A large amount of job work is done at this foundry for local purposes and for foothill, mountain and valley customers, who can get their work here to advantage. The proprietors of these works are all practical and experienced workmen.

NOTICES OF PATENTS.—We are obliged this week to omit our usual list of patents and also the notices of recent patents. When the force in the patent office was reduced recently, a circular was received stating that owing to that circumstance the business could not be transacted with that promptness which had formerly characterized the patent department. It must be owing to this, therefore, that our usual list of patents failed to come to hand on time this week. We will give the list in our next issue.

SUCCESSFUL ENGINEERING.—The reef at Hell Gate, the entrance to New York harbor, was successfully demolished by the explosion last Sunday. Great preparations were made for the event, and thousands of people were present. Although very effective, the blast did not make so much of a "spectacle" as was anticipated. There is now plenty of water for vessels to pass over the place where the reef was before the explosion.

Small and Large Mining Companies.

We frequently hear complaints from various mining camps on this coast that, "the camp will never amount to anything until some big company takes hold of it." There is no doubt that many camps have been "brought out" by big companies; but how about the hundreds of other prosperous camps which never had any big companies? Something must have brought these camps to the front, and if it was not a big company what was it? In truth, it is not always best to tie to the large companies with the capital stock in eight or nine big fat figures on paper. Large companies are good things, no doubt, to carry out large operations, but they are not always blessings.

We ourselves, like many others, believe that more can be accomplished to develop a camp with small companies of honest, hard-fisted miners, with some capital of course, than when one large company takes hold of the whole thing. With the small companies a dozen or two claims are prospected at once, and if any one or two of them are moderately successful it incites others to renewed exertions. They generally pay their way pretty well and stick to the camp where all their interests are. With the large companies, with their offices in San Francisco, London or New York, the superintendent or resident manager reigns supreme. If you don't work for him you don't work at all, and of course under such circumstances a man will become arbitrary and overbearing.

When there is one large company "running" a camp much less interest is felt in the smaller ones. If these claims do not come up to what the big one is supposed to, purchasers are scarce. We are speaking, of course, of the smaller camps, not referring to Virginia, Eureka and such places where they are all large companies. A great deal can be accomplished by half a dozen energetic men with a few thousand dollars, provided the money be expended prudently. One of them can act in one capacity and one in another, and expensive salaries, incident to large companies, are saved. As for milling machinery, there are now-a-days so many custom mills or works, that it is by no means a necessity for every mine to have its own mill. We think really that as much harm has been done by companies trying to get extensive works before they knew what their mines were, than by anything else. It not only costs money to build mills but a great deal of money to maintain and run them. Moreover, everybody does not know how to do it. Some companies would do first rate as far as the mining goes, but when they come to take hold of a mill they fail; and the worst of it is they will never acknowledge the failure. It is a mighty hard thing to get a miner to confess he does not know everything worth knowing about metallurgical processes. But a man who has worked half his life underground, and has a general knowledge of milling or smelting, is not always competent to take charge of metallurgical works on his own hook; nor on the other hand is the metallurgist always able to manage the mining department.

When a few men who understand their business take hold of a mine, they know how to make every dollar count in the work. It is not always so with big companies. The employees are only directly interested as far as their salaries are concerned. To keep them running they often do things which small companies would not do. If it is found that a mine is worked out or will pay no longer without heavy outlay, why not drop it? A mine cannot be expected to last forever. Everybody can't find a Comstock ledge, and everybody need not think he has one when he has a mine. Small companies can do better with small ledges than large companies can; and a number of small companies and some capital can do more than a few large companies with large capital.

BULLION SHIPMENTS.—The bullion shipments from prominent mines have been as follows since our last report: California, Sept. 20th, $125,974.56; Ophir, Sept. 21st, $22,077.49; Con. Imperial, Sept. 20th, $10,912.44; Northern Belle, Sept. 19th, $12,009.45; Comanche, Sept. 19th, $7,535.22; California, Sept. 21st, $71,264.01; Tybo Con., Sept. 18th, $8,739.45; Justice, Sept. 22d, $20,211; Sept. 23d, $16,118; total to Sept. 23d for month, $98,209; California, Sept. 25th, $66,152.49; Ophir, Sept. 26th, $25,348.80; Leopard, Sept. 24th, $7,600; California, Sept. 26th, $86,281.48; Con. Virginia, Sept. 25th and 26th, $85,247.89; Leopard, Sept. 24th, $7,685.63; Northern Belle, Sept, 24th, $17,366.63, Tybo, Sept. 22d, $12,831.01; total this month, $43,755.11.

THE SACRAMENTO BOILER WORKS.—These works are located at No. 37 Fremont street, corner of Mission, in this city. The proprietors were established in business in Sacramento City for some nine years. Messrs. Hall & Kelahaw are practical boiler makers, and also manufacture hydraulic pipe, oil or water tanks, gasometers, girders, bridges, and do all kinds of sheet iron work and repairing.

ON FILE.—"Tybo District," J. D. P.; "More of the Mines of Nye County," A. C. K.; "Items from Ward District," Fox; "Alpine County Mines," Victor Harlaud.

MECHANICAL ORE CONCENTRATION.—The continued article on this subject is deferred this week, as certain engravings to accompany it were not completed in time.

Comstock Papers.

NO. 6.

The Pioneer Locators on the Comstock—Their Fats and Their Fortunes.

As some account of the history and subsequent fortunes of the men who first located claims on the Comstock lode, or who, through the purchase of interests, the construction of mills or otherwise, became prominently identified with its early annals, might prove of interest to the general reader, we will at this stage of our remarks and before proceeding to speak of the era of its active development, give to the public such scraps of information on these points as we can now recall to mind or have been able to pick up from conversations with Washoe pioneers. It may be observed at the outset, that a large proportion of these men, once seemingly so favored of fortune or who enjoyed such rare opportunities for the easy acquisition of wealth, are now dead, only moderately rich, or abjectly poor. Although but little more than seventeen years have elapsed since the occurrence of these events, more than half the first locators on the Comstock lode are dead, while very few of the survivors are possessed of large pecuniary means; results attributable, in good degree, to their liberal and improvident habits, coupled very often with a rough and careless life.

Comstock Himself

Soon spent the proceeds realized from the sale of his different pieces of mining ground, amounting, perhaps, to twelve or fifteen thousand dollars altogether. After remaining about Virginia City for five or six years, during which he made many prospecting tours into the country adjacent, he left his old stamping grounds and went to Montana, where he perished from a pistol shot through the head inflicted by his own hand while laboring under temporary insanity. This condition of mind was induced by hardships and exposure suffered while on an exploring expedition in the mountains of that Territory during the winter of 1869. Failing in these prospecting tours to find any mineral deposits of value, he never succeeded in restoring his wasted fortune, but died leaving neither money or possessions behind. For a number of years Comstock, as was the case also with many of his companions, made some money testifying in the courts of Nevada in regard to the early location of claims along the great lode that now bears his name, issues involving millions of dollars being sometimes dependent upon the testimony of these men.

Fennimere, "Finney," "Old Virginny,"

(For by all these names was he known,) the first mentioned being, no doubt, his true and proper cognomen, died in destitute circumstances near Virginia City, which was named after him, a couple of years after the outbreak of the Washoe excitement, a few of his old cronies having contributed to his support towards the last. His death was caused by advanced years and a rather free indulgence in alcoholic stimulants, a habit to which he appears to have been long addicted. As already stated, he received nothing for his interest in claims upon the great mother lode, nor did he, like many others, benefit by his knowledge of the locations first made along it, his demise having happened before any of the more important legal contests came on. Of all the original claim owners none fared so badly, in a pecuniary point of view, as "Old Virginny," a man who, in so far as there was any merit in being early on the ground, deserved to have profited from this circumstance above all others.

Peter O'Reilly,

Who realized more from his Comstock claims, perhaps, than any other of the original locators along it, having in the fall of '59 received from John O. Earl and Judge Walsh $36,000 for his interest in the Ophir ground, had for several years before been a resident of the Washoe country. Besides mining, he also engaged in farming, having been the owner of a well cultivated piece of land, situated two miles below Dayton, on the Carson river. O'Reilly was a man of good appearance and possessed of more education and intelligence than most of his companions, though exceedingly visionary and at times supposed to be a little flighty on some subjects. He engaged in a number of unprofitable enterprises, among others the erection of a capacious and costly stone edifice, commenced in the fall of '59 at Virginia City, having been the first structure of large dimensions undertaken in that place. He did not live to see it finished, having died the next year in a lunatic asylum, very far from being the Crœsus that, in his dreams of great wealth, he imagined himself destined to become.

McLaughlin, The Winters Boys and Hammack.

Patrick McLaughlin the same fall disposed of his Ophir ground to Morrison & Hurst for the trifling sum of $2,500, nor did he ever after succeed in raising any large stake out of Washoe. He left the country poor, and has of late been following the laudable but ill requited and uneventful calling of a sheep herder in California, a bonanza that yields him probably from ten to fifteen dollars per month of net profits. Of the Winters Brothers, John D., Joseph and Theodore, who at one time owned amongst them extensively in the best mines at Virginia City and Gold Hill, all are living on or near a large ranch owned by Theodore on Putah creek in this state. These boys removed with their parents from California to the "Eastern slope" some years before the discovery of the Comstock lode, having been residents of Washoe valley at the time of that event. They followed farming and freighting over the mountains, having belonged to what was in early times denominated the "bullwhackers' brigade." The mother of these boys was a woman of great energy and decision of character, and the sons took after her, exhibiting at times rather an excess of action and animal spirits. What with the sale and working of their mining properties, they made at first a good deal of money; but being no niggards, it went at the same time pretty freely, Theodore being now the only one of their number who has much property left.

A. G. Hammack, one of the primitive stock of miners on Gold canyon, managed to secure, partly by location and partly by purchase, considerable interest in the Central, Chollar and Yellow Jacket grounds, the 100 feet he held in the latter having been received from the owners for running short open cut on the claim. He sold his interest in the Central for $20,000, got several thousand dollars besides for his other interests and left in the fall of '59, returning to his family in Alabama, who were said to have been in needy circumstances. Hammack enjoyed a good reputation among his companions for honesty and square dealing, and possessed many strong traits of character. He is reported to have been killed during the Rebellion, fighting on the Confederate side, though his advanced age, over sixty, renders this statement somewhat problematical.

California Mines.

Although the State of California has a reputation throughout the world as the "land of gold," the citizens of her metropolis are much more interested in the silver mines of the adjoining State than in the gold mines of their own. In fact, as a general thing they manifest a remarkable apathy in connection with them. They do not care to post themselves about the California mines, much less foster them, but utilize their spare time and cash in developing the silver interests of Nevada. We all acknowledge that the Comstock is the most wonderful and richest of all ledges; but that it is the only thing in the mining line which is worthy of attention is by no means true. There are in California to-day, hundreds of gold mines which only need a small capital and intelligent labor to develop to good paying properties.

But of the mines here that are paying well now, very little is known. As most of them are private companies with no stock for sale, little attention is paid to their operations. The local papers published in the vicinity of these mines speak of them occasionally, but as most of the city papers only refer to such mines as are dealt in at the stock boards, the class of mines referred to are not widely known. The PRESS has always made a specialty of collating the mining news of the week from all parts of the coast and presenting in the "Mining Summary" the latest news from all these mines, whether on or off the boards. We flatter ourselves that by so doing we have benefited the California mines particularly, for the reasons above mentioned.

A glance over the "Mining Summary," published on other pages of this issue will show that among the mines mentioned this week only, many of them are paying handsomely, and that more real genuine work is being done than most people imagine. Taking a few items as they appear in the "Summary," they prove that California mines are by no means "played out." On the Main Feather River company's claim in Butte county, work has been commenced to tap the the river bed by a novel system. In Calaveras county the Champion mine has just cleaned up $11,000 from 65 tons of ore, an average of about $170 per ton. They do not find so very much ore outside this State that actually works up to that figure. In the St. Lawrence mine in El Dorado county, on the 800-foot level, exceedingly rich ore has been found. In Inyo county the base bullion yield is increasing, and a number of these new mines are yielding immensely rich ore in large quantities from large ore bodies. In Mariposa county several old mines are being reopened. The North Bloomfield hydraulic mine in Nevada county shows $15,800 as the partial proceeds of a 22 days' run, with a profit to the company of $8,000. This mine is not fairly in its work yet, but when all opened will increase the yield for many years. In the Cold Spring gravel claim, in the same county, they have struck the channel where formerly the gravel has yielded $100 to the pan. In Placer county, in the upper part, are immense bodies of gold bearing gravel deposits which will all in time be worked. Those now being worked are paying well. In the same county, in the Old St. Patrick, they have just struck rich rock in the new shaft. The new 20-stamp mill of the Green Mountain company in Plumas county started up last week. In Trinity county the other day, some boys struck a pocket which has yielded to the hand $30 to $40 per day. In Tuolumne county the *Independent* mentions a mine which is taking out from $20,000 to $25,000 a month. Other mines in the county are mentioned as paying very well.

Some of the Mines of Nye County.

[From our own Correspondent.]

A ride of some 80 miles south from Austin, most of the way through Smoky valley, with an occasional glimpse of a farm house in the distance, brought us towards evening to

Jefferson Canyon

And district. It only required a moment's glance at the general geological features of the surrounding country; the bold and massive croppings of quartz, extending as far as the eye could reach, bordered on one side by the slate as country rock, and the other by broad belts of granite, to leave a most favorable impression as to its prospective value as a metalliferous district. After what had been said in my letters from Austin so highly commendatory of her mines, the account of the "marriage supper" where "the best wine was reserved to the last," was very naturally suggested, particularly after reaching Barcelona and Belmont, both extensive mining camps with numerous locations, and where, it may be stated, barring some slight modifications, were encountered similar formations, croppings and ledges, as at Jefferson. They, in fact, while not so large as regards the veins, in many respects bear a very striking resemblance to those of Gold Hill and Virginia City. Although some of the

Mines of this Region

Are somewhat under a cloud, in other words depressed in the stock market, yet intrinsically they are as valuable, and stand in the estimation of the community as high as ever. You are aware that there are laws psychical as well as laws physical. If the law in regard to equality of action and reaction belongs to the one, it must be alike applicable in the other. If the one has its cataclysms, its ebb and flow of tide, so must the other. In the physical world the storm cloud bursts in a moment, as it were. Its work of desolation is done, to be followed, perhaps, by years of uninterrupted sunshine. In the great "struggle for existence" arising from the varied play of forces, rational, mental and passional, and from the clashing of different interests, storm clouds meet and burst and temporary disasters follow; finally a reaction comes, the financial atmosphere is purified, and the errors and mistakes of the past set up as beacons. So the great world, gathering up new strength from its lessons of wisdom, and following the eager tread of ever expectant hope, marches onward to other struggles and for further conquests.

With all the losses, failures and mistakes heard of in mining operations, mining as a business has been made profitable, and can and will be made even more so, and a great future may safely be predicted for this and neighboring localities.

The Jefferson Mine,

Whether taking its name from the district or vice versa it matters not, although at present taking out but little ore, being engaged principally in making further developments, has the name of having had in the past some of the richest ore in the State, giving assays from $25,000 to $27,000 per ton, whether of pulp or otherwise was not learned. The entire product of bullion from its location to date, so far as could be ascertained, approximates $300,000. Owing to the absence of the superintendent, only a few facts were obtained as to its present condition and workings. The company have a good 15 stamp mill with a White furnace attached, and about 20 men employed about the mine, where good hoisting works and the usual necessary appurtenances were found. The greatest depth attained is about 600 feet, on which level a drift had been run on the ledge over 150 feet. A winze 100 feet or more was being lowered from the 400-foot level towards the 600-foot, with the view of getting a better circulation, when more men would be put on.

This ledge is very well defined from the very surface, from two to nine feet wide, usually known as the Prussian ledge. The company are also running, from the 320-foot level, a crosscut, now in 140 feet, with 100 more to go before cutting the other ledge of the company's, the Jefferson proper, in which, if we did not misunderstand Mr. Fleming, the foremen, some $800 rock had been found.

The Prussian

Has a vein fully 10 to 12 feet wide, and 50 feet of ledge matter between the two formations, dipping to the east at an angle of about 45 degrees, and may be set down as a true contact vein—the character of the ore, chloride, changing with depth to the black sulphuret, and perhaps to ruby, as in the Jefferson location. After sinking to the depth of 300 feet, a very large body of water was struck and the work stopped, as it was thought the machinery was not capable of handling it at that point.

I learned from Mr. A. Bray, formerly of the Golden Chariot, Idaho, and who had been recently sent up by the company as superintendent, that the prospects of the ledge were such as to recommend the sinking of a new double compartment shaft 1,000 feet east of present workings, at the foot of the mountain, where the ground is 100 feet lower than the present depth attained. By sinking 600 feet at this point the dip of the ledge would be reached, the present engine being of sufficient capacity to meet all the requirements. The mine thus far has yielded in the neighborhood of $175,000. In connection with the property there is an excellent 10-stamp mill, and room for the addition of 10 more, and an assay office completely furnished, at a cost of some $2,000. All the usual and necessary appliances found in any well regulated mill were here, including self-feeders, settlers, tanks and pans. Weight of stamps, 800 pounds. Engine and boiler from Booth & Co.'s. The power of former sufficient for 20 stamps.

In Jefferson canyon work was going on at three different mines, located near together on the same ledge, with very flattering prospects, although still very near the surface. The Rappahannock, located by Geo. Savelon, in 1872, had one that worked as high as $732, second class, $400; ledge, three to four feet; character of ore, chloride and horn silver. The Hillside—Harris Bros.—first class, $600; second class, $432; and third class, $250. The Troy had similar ore. As the owners are all working men and of limited means, it is to be hoped that their anticipations will be realized.

Jett District.

The Jett district, a recent discovery, is situated 15 miles west of Jefferson canyon, in the Toiyabe range, and the same district south of Ophir canyon. The first location made was the Wildidle, by Jett & Davenport. Incline 100 feet; getting good smelting ore all the way down, said to average $80 to $85 per ton.

The Centennial,

Is represented by the Volmer Bros., principal owners and among the staunch business men of Belmont, as one of the most promising ledges of the district. It was located on the 4th day of last July, by James White and John Terrill, is of mammoth proportions, and traced by the croppings for more than 2,500 feet.

The impression prevails that if it only holds out in width and in quality of ore as depth is attained, that the receipts of the coming assessor will be considerably swelled. Be this as it may, the average of assays, at different times and from many different places on the course of the ledge, was entirely satisfactory to the owners, giving in silver $81.40 per ton, and 60 per cent. lead. The vein from wall to wall is now six feet. A furnace test will soon be made, which, I trust, will not only fully but satisfactorily settle the question as to the richness of the argentiferous ores of the county and district. In addition to the Wildidle and Centennial, several other locations have been made; among the most promising spoken of are the Jett and the Hollis, which exhibit good smelting ore. Wood and water are said to be abundant, and expectations run high for the future of the district.

Some eight miles from Jefferson, on stage route to Belmont, is Barcelona City, in the center of Spanish Belt district, where there is a perfect swarm of locations.

The Barcelona Consolidated,

At the foot of a 200-foot incline, has a ledge, represented to be as much as 40 feet in width, lying between the two great formations of this section, with slate on the hanging wall and porphyry on the foot wall, and at no great distance from the granite, with dolomite occasionally making its appearance in the vicinity of the ledge. A cross-cut had been run from the 200 foot level, cutting the vein at 32 feet east of the incline—14 feet more bringing it to the hanging wall, and giving them that width of good ore, represented by Mr. W. V. Price, in charge of mine, as averaging for first class $200 per ton, and consisting of copper glance, antimonial silver, chlorides, together with some other varieties, and occasionally a little native silver.

If Mr. Farish, the superintendent, had not been absent, no doubt a much fuller account, with interesting details, could have been obtained in reference to the mine. It is looked upon as one of the leading mines of the district and exceedingly promising. A. C. K.

Pacific Coast Awards at the Centennial.

The awards of medals and diplomas at the Centennial exhibition have nearly all been made by the president of the Centennial commission. There are still some 4,000 to be passed upon. We give below those made to Pacific coast exhibitors, as far as yet made public:

California.

San Francisco—J. W. Gashwiler, silver and gold ores; John S. Frink, silver ores; William Willis, silver ores; Jas S. Pierce, gold gravel and cement; J. A. Pritchard, silver ores; Thomas Ball, quicksilver ores; Joel F. Lightener, gold and silver ores; Bradley & Rulofson, photographic designs; Will & Finck, table cutlery; Tiburcio Parrott, sulphur and quicksilver; W. Leots Oliver, gold ores; B. B. Minor, silver and gold ores; W. F. Palmer, axes, hatchets, adzes, chisels, drawknives; Newman & Co., glass demijohns covered with tule packing; Consolidated Tobacco Company of California, cigars and cut smoking and granulated tobacco; J. S. Harbison, honey; Adolph Asman, caviar prepared from cod roe; Hopgood & Co., canned salmon; Miller & Sievers, cones of California *coniferæ*; Oscar Tiffany, fruit-drying machine; Mission Woolen Co., blankets; Joseph Neumann, raw silks and silk cocoons; Herzog & Co., imitation of horse-hair gavel; Louis Herrison, railroad axle and independent wheels; Mrs. A. G. Supplee, needlework; Thomas Houseworth, landscape photographs; C. E. Watkins, photographs.

Temescal—San Jacinto tin manufacturing company, tin and tin ores.

New Almaden—J. B. Randol, quicksilver ores.

Lake county—Great Western quicksilver mines, ores.

Napa City—George Fellows, quicksilver ores.

Cherokee Buttes—Louis Glass, gold, gravel and cement.

Chico—George A. Dietz, fruit dryer.

Woodland—R. B. Blowers, dried fruits.

Dutch Flat—T. B. Ludlow, Cedar Creek mining company, gold, gravels and cement.

French Corral—V. G. Bell, gold gravel and cement.

Nevada.

Virginia City — John Lambert, gold-bearing silver ores; John W. Mackey, gold-bearing silver ores; S. L. Jones, gold-bearing silver ores; Theodore Winters, gold-bearing silver ores; T. C. Kyles, gold-bearing silver ores; J. A. Myrick, gold-bearing silver ores; Henry Donnelly, gold-bearing silver [ore; James G. Fair, gold-bearing silver ore; S. T. Curtis, gold-bearing silver ore.

Austin—Melville Curtis, silver bullion, silver pulp, etc.; Theodore Hale, native sulphur; A. Curtis, silver ores.

Churchill county—B. F. Leet, salt and saltpeter; Browning, crude soda.

Eureka—Thomas Wren, silver and lead ores; John Shaw, gold-bearing silver and lead ores; James M. Haggin, gold-bearing silver and lead ores; J. J. Corrigan, gold-bearing silver and lead ores; Rhodes & Wasson, borax and salt.

Pine Grove District—E. R. Willis, gold-bearing ores.

Cortez Mining District—S. Wenden, silver and lead ores; Joseph Trask, silver ores.

Battle Mountain—Joseph Richards, copper ores.

Morey District—W. F. Randolph, silver ores.

Pioche—Captain H. H. Day, silver ores; T. A. Butler, silver ores; Charles G. Heath, silver ores and rock salt.

Gold Hill—Charles C. Stevenson, amalgamating machine.

Unionville—J. C. Fall, silver ores.

Cornucopia Mining District—Dr. J. M. Goodfellow, silver ores.

Belmont—J. Grimes, silver ores; L. Hanchett, silver ores.

Oneota Mining District—John Howell, silver ores.

Mineral Hill—Captain F. H. Haskins, silver ores.

Tybo—B. Judson, silver and lead ores.

Hamilton—Captain F. Drake, silver ores.

Reveille Mining District—George B. Clark, silver ores.

Oregon.

Portland—Koshland & Bros., hemlock and oak-tanned harness leather; McDoren Bros., oatmeal; Oregon pickling company, preserved fish, salmon; Oregon furniture manufacturing company, burlap, maple and shittim wood; A. Booth & Co., Oregon preserved salmon.

Clifton—J. W. & A. Cook, salmon in pickle and cans.

Columbia River—Myler & Jewett, canned salmon.

Salem—Benjamin Forstner, patent perpetual paper-hits.

Oregon City—D. D. Prettyman, Oregon City mills, flour from winter wheat; Oregon City woolen mills, fancy cassimeres and blankets; John Marion, pruning shears.

Baker City—J. C. Jackson, gold ores.

Utah.

Salt Lake City—General P. Edward Connor, ores; P. R. Chambers, silver ores; Colonel William Johns, silver and lead ores; W. B. Wells, silver and lead ores; D. K. Bentley, silver and lead ores; Walker Bros., silver and lead ores.

Lucien District—G. N. Adams, lead ores and arragonites.

St. George—W. S. Barbee, silver ores.

Bingham Canyon—Nez Perces and Montreal mines, silver and lead ores.

Washington Territory.

Olympia—W. O. Bush, cereals:

Eagle Cliff—William Hume, canned salmon.

British Columbia.

Victoria—F. M. John, specimens of prepared fish; Holbrook & Cunningham, canned salmon; A. Loggie & Co., salt salmon front in barrels and kits.

The Juniata.

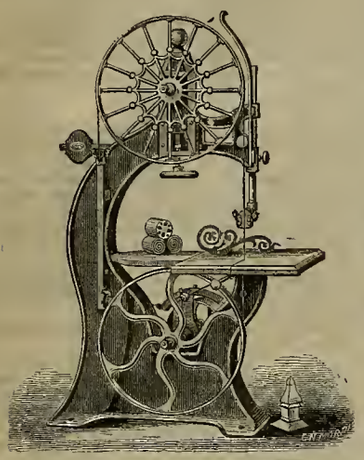
Many a school-boy of the last generation will find his ear ringing with schoolhouse songs at the thought of "The Blue Juniata." Our illustration fitly portrays one of the many entrancing scenes along the gentle river. The location is on the line of the Pennsylvania railroad, and travelers on that line can recall the landscape.

Massiveness, softness of outline, and variety, are the distinguishing peculiarities of the Juniata scenery. The miniature river, in its course of 100 miles through the numerous outlying mountains, has apparently overcome the obstacles in its way by strategy as well as by power. At many places it has dashed boldly against the wall before it and torn it asunder; at others it winds tortuously around the obstructions—creeping stealthily through secret valleys and secluded glens. At some points the mountains appear to have retired from the attacking current, leaving numerous isolated hills standing, as sentinels, to watch its progress. But the severed mountains, the towering embankments, and the sentinel-like hills, are all toned into form and molded into shape by the action of the elements and the foliage of nature, leaving no abrupt precipices and but few naked rocks to mar the uniform beauty.

PACIFIC MACHINERY DEPOT,

H. P. GREGORY & Co., Nos. 14 & 16 First Street,

P. O. Box 168. **San Francisco, Cal.**



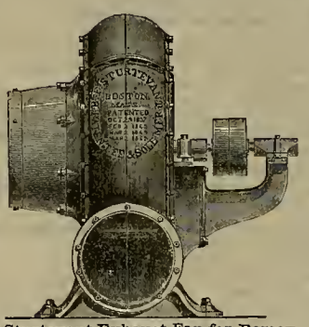
SOLE AGENT FOR THE PACIFIC COAST FOR

J. A. Fay & Co's Wood-working Machinery,

Blake's Patent Steam Pumps,

Tanite Co's Emery Wheels and Machinery,

Fitchburg Machine Co's Machinists' Tools,



Sturtevant Exhaust Fan for Removing Shavings and Sawduet from Machines.

Sturtevant's Blowers and Exhaust Fans,

J.A. Roebling's Sons Wire Rope,

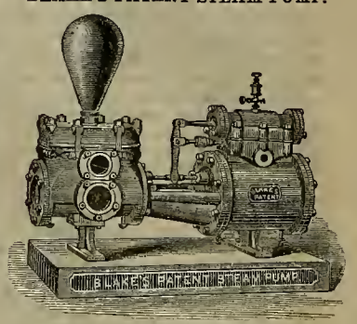
Pure Oak Tanned Leather Belting,

Perin's French Band Saw Blades,

Planer Knives,

Nathan & Dreyfus' Glass Oilers, and Mill and Mining Supplies of all Kinds.

BLAKE'S PATENT STEAM PUMP.



Over 8,500 in Successful Use in the Unite States.

DEWEY & CO.,

PATENT AGENTS

Office—224 Sansome Street, San Francisco

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

DEWEY & CO., Patent Solicitors,

San Francisco, 1876.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

Much Obliged, Etc.

PORTLAND, OON., June 26th, 1876.

DEWEY & Co., Patent Solicitors, S. F.—*Gents:* I am much obliged to you for courtesy shown me, and am well pleased with the manner in which you have done my business, and a-sure you, will cheerfully recommend you to my acquaintances needing such services. Hope to have a case again before long, of my own. I have been an inventor all my life, but let others reap the benefit, or had work stolen from me. Please have the extra copies of my patent, etc., mailed to me direct, and oblige Yours truly, J. H. WOONRUM.

Newspaper Fileholders.

Dewey's new elastic fileholders (black walnut), size of the PRESS, *Harper's Weekly* and *Scientific American*, for 50 cts. Larger sizes, to suit any newspaper, 75 cts. By mail, postpaid, 10 cts. extra. Cash with all orders. Patent allowed. Address, DEWEY & Co., Publishers, San Francisco.

THE MINING AND SCIENTIFIC PRESS is the leading journal of America. New processes and mechanical inventions are illustrated and discussed in its weekly issues. It is a 16-page sheet, handsomely printed, for $4 per year. Dewey & Co., publishers, San Francisco. —[Mt. Lincoln News, Alma, Colorado.

MINERAL CITY, WHITE PINE Co., NEV., May 2d, '76.

MESSRS. DEWEY & Co.—*Gentlemen:*

I have just received Canadian letters patent for Fuse Lighter. Also, Canadian letters patent for the Drill Extractor. I return you my thanks for the able manner in which you have conducted the business.

Yours respectfully, JOHN W. PLATT.

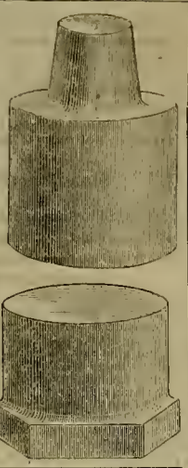
PATENTED

CAST STEEL SHOES AND DIES.



Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

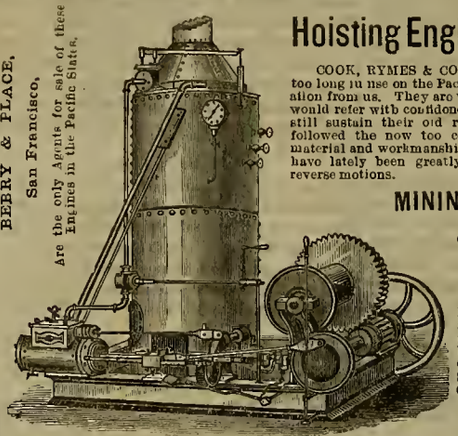
Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Cut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,
59 Nevada Block, S. F.

BERRY & PLACE, San Francisco, Are the only Agents for sale of these Engines in the Pacific States.



Hoisting Engines. Mining Engines.

COOK, RYMES & CO.'S celebrated Hoisting Engines have been too long in use on the Pacific coast to require any special recommendation from us. They are well known from Alaska to Mexico. We would refer with confidence to any one of the hundreds in use. They still sustain their old reputation, the manufacturers not having followed the now too common practice of reducing the quality of material and workmanship to compete with cheaper engines. They have lately been greatly improved by adding large drums, and reverse motions.

MINING HOISTING ENGINES.

(Manufactured by the same parties.)

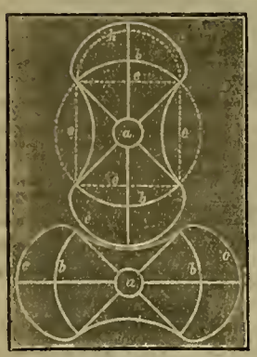
Our new Mining Engine is built from plans and specifications of several of our MOST SUCCESSFUL MINING ENGINEERS, and the result is the most complete

Double Drum Hoisting Engine

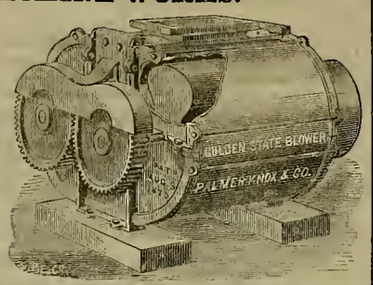
Ever built. Their advantages will be seen at a glance by any one familiar with the necessities of a mine. These engines may be seen in use in Opbir, Con. Virginia, Chollar, Europa, Niagara, Leviathan, Phil Sheridan, and several other mines on the Comstock Lode. For sale only at

BERRY & PLACE,
(Succeeors to Treadwell & Co.)

GOLDEN STATE IRON WORKS, CO-OPERATIVE,
FOUNDRY and MACHINE WORKS.



Mining —AND— Milling Machinery OUR SPECIALTY.



GOLDEN STATE SUCTION AND PRESSURE BLOWER FOR VENTILATION OF MINES. BLAST OR EXHAUST FOR FURNACES OR REDUCTION WORKS.

They have no superior. The casing is made in sections, so as to be easily accessible. They run easily, not rapidly, and the perfect contact of wings gives a uniform and powerful blast.

Of Twenty Years' Experience in opening and working Mines, building mills and working gold and silver ores, specially those termed *Rebellious*, is open to engagement. Address, E. B. SMITH, this office.

Thanks for Prompt Attention.

STOCKTON, June 26, 1875.

Messrs. Dewey & Co., S. F.:—

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

NOW'S THE TIME.—Everybody interested in mining and agriculture should subscribe for the Centennial year for either the RURAL or the SCIENTIFIC PRESS, published by Dewey & Co., San Francisco. They are the best journals of the kind in this country, and deserve the support of all those whose cause they espouse. Everything of interest connected with the Centennial, appropriate for these papers, will be collated. Send in your names.—*Mountain Messenger.*

"SPEAKS WELL," ETC.—We would return thanks for an exchange and back numbers of the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., of San Francisco, Cal. It is a well edited, interesting, and valuable journal, and speaks well for our Pacific neighbors.—*U. S. Milling and Manufacturing Journal.*

BLACK DIAMOND FILE WORKS.

Arizona.

BULLION.—Wallapai *Enterprise*, Sept. 15: Two bars of bullion from the Hackberry mill, which we saw in the store of Messrs. Davis & Randall, to-day, were stamped as follows: The first 1,183 ounces, 915 fine, value, $1,396.41. The second was only 883 fine, weighed 1,212 onnces and is wortb $1,383.74. It is seldom the huilion prodnced at this mine is under 960 fine.

THE "63" mill at Cerbat is about ready to start in working ore. Mr. Blakely has removed with his family to the "63" mine, and will soon have a force of men at work taking out ors.

Montana.

WILLOW CREEK MINES. — Cor. Helena *Independent*, Sept. 14: Morley runs a five-stamp mill, and Getchell is putting up a two battery mill. We visited the mines, and, to say the least, were agreeably surprised to find them so extensive and rich. The main paying or producing lodes are located on a spur or hog back that extends laterally east from the main range east of South Boulder. The Strawberry lode, owned hy Moreland & Roheson, lies first to the east. It is developed to a depth of 30 feet, and shows 100 feet of qnartz on the surface, which pays $29 to the ton. Whether this immense body of rich ore represents the lode or a fortunate enlargement, remains to be proved. Some of the ore has run up to $80 per ton, and Mr. Moreland, proprietor of the east half, could work 100 men if he had stamps to reduce the ore.

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

Obsidian or volcanic glass is sometimes nsed for jewelry and ornemental purpoees, and especially for monrning jewelry. It doee not command a high price, althongh the variety which is iridescent is beautiful and ie much admired. Obsidian ie very abundant in Lake connty, near Clear lake, in Inyo county and in Mono county. It is never found crystallized. The fractnre ie perfectly conchoidal; it heats with sherp edgee and has been need even in pre-historic ages for arrow-heads, knivee, epeare, etc. The Aztecs used knives of obeidian to cnt ont the hearte of the human eecrifice which they offered to their idols.

Obsidien ecratchee glase elightly. Specific gravity, 2.34 to 2 39. B. B. fuses with difficnlty to one opaqne, scoriaceoue mass. The following ie an analysie of obsidian: Silica, 83,-38; protoxide of iron, 5.46; alnmina, 3.79; soda, 4.53; lime, 2.42; wster, .15=99.73.

Obsidian was well know to the ancients. It ie said to have taken its name from Obeidianns, a Roman, who first brought it from Ethiopia. According to Pliny it was also called liparen, from the island of Lipari, from which it was obtained. It was nsed for mirrors, pleced in walls. The inhabitents of Quito, not many years ago, made the same uee of it.

When, in the early deye of California, it was first discovered at Cleer lake, a company was formed to make hottles and other glassware of it, but, of course, without snccess.

Hanyne occure crystallized in the isometric system in lavas of Vesnvius. Hardnees, 5 5 to 6; specific gravity, 2.4 to 2.5; color, light blue, sky hlne, asparagus green; etreak slightly blue to nearly white, snhtraneparent to translucent. Its chemical composition is as follows: Silica, 32; alnmina, 27.4; lime, 9.9; soda, 16.5; enlphnric acid, 14 2=100.0 Hanyne is sometimes nsed in jewelry, and is need for rings, esr-rings, hrooches, etc., but ie not very highly prized.

PARTIES who have heen engaged in jnmping land in Astoria, Oregon, have heen enjoined by an order from the State Circnit Conrt for the district.

THE Servian war still continnes, and the Turke are still committing atrocities. The latest newe ie to the effect that tbey recently massacred 700 Armenian Christians.

THE training ship *Jamestown* has arrived in port from a crnise to Honolulu. Wm. H. Perritt, one of the hoye, wae drowned on the 2d inetant while practicing making sail.

COMMODORE AMMEN, of the United States navy, ie preparing a paper for the American geographical society concerning the resulte of the varions surveye for an interoceanic ehip canal acroee Central America, made nnder the direction of the navy department.

TERRIBLE euffering is heing experienced in Puerto Principe, formerly one of the richeet citiee of Cnha. Forty thousand ratione are distrihuted in the market place to the poor twice a week. Property and housee can he hought at very low pricee. The Spaniarde are fortifying the approaches to Cienfuegoe from hoth land and sea with heavy gnns detsched from forts.

California State Fair.

Contrary to nsual cnstom during fair week in Sacramento, the weather thie year was very pleesant and cool most of the time. The Sacramento deilies failed to publish the entries at the fair this year. Therefore the premium list in another part of this issne will give a fnller idea of what was exhibited than has been otherwise publiehed.

The deily receipts at the fair gronnd were reported larger than usual thie year, hnt to the eye the crowds seemed lees nnmerons than at previoue seasons.

The display of horees was fine indeed, hnt not so notable as on some former occasions.

Among the horned etock we noticed the absence of eeveral of the moet famous (if not the best) herde in the State. Theee present, however, were worth coming a long way to see. Thie pert of the show lacked mnch in numbers in comparison with that of the year previous. We regret not having notee snfficient to do justice to the very fine etock in this department at present.

At the Pavilion

Things were arranged in hetter order than ever before, and as a whole the display was hetter than usual. The frnit exhibit was all very fine, although the number of exhibitors were few.

The Sacramento heet sngar company, among other choice eamples, showed some fine crystallized cubes made hy the new Wadeworth machine.

Sewing machines occupied a large spnce, ee gay and lively ae ever. Useful and ornnmental merchandiee and home mannfactured wnree were abnndent and choice in variety.

Fisk & Gill exhibited electric burglar alerms, electric engines in operation, and gave electric shocks free to visitors, oansing mnch merriment. They are mannfecturers of electricnl instrnmente and their ehow was one of the most engaging in the fair.

The Angora robe and glove mannfactnring company gave an exhibit worthy of a world'e fair; we shall speak of the articles exhibited at another time.

In the fine art department were many good pictnres and as many poor ones. Lnssier & Hill'e collection, altogether, we think was nnsurpeesed. Considerng Mr. Hill'e age and experience, hie modern and ancient harveet scenee were considered remarkable productione.

In the Lower Hall.

Here, appropriately at the hace of the whole concern, the *Fair Daily Gazette* was iseued free hy H.S. Crocker & Co. It imparted much life to that realm of the fair.

The Sacramento plow compeny ehowed the California frnit drier, (Dietz patent) in fnll size working machine. The semi-pyramid of its dried frnite made a good exhibit and attracted mnch attention. The samples embraced a good variety, including figs, raisins, tomatoes and common fruits.

We have not epace to mention hut a little of whet was creditable in hoth halle of the pavilion, emong others the floral display, which was very rsre in some of its features.

The Agricultural Implements

Were mostly displayed at the fair grounds. The circnlar cutting edged gang plow, exhibited hy Baker & Hemilton, and teeted in the field, attracted more attention probahly than any other one implement. Hundreds who saw it operate in a dry alfalfa field spoke favorahly of its working. In due time we expect to give an illnetration of it in our columns. In the meantime, gentlemen, make the most of yonr old gange, and never wait for the wagon or any other newfangled notion nntil it is thoroughly proven.

Byron Jackeon, of Woodland, hed a veteran looking eteam wagon working as eteedily es an old ox team and twice as obedient. It ran his improved eeparator, which wonld have threshed a stack of grain as lerge as the State capitol (including the legislature when in session) if properly placed on hie combined patent eelf-feeding table and derrick. Hie are ingenious and practicehle inventions.

Joseph Enright'e straw hurning engine, from San Jose, a handsome piece of machinery, worked qnietly and admirably.

Rice'e "straw-hnrner" was exhibited hy Marens C. Hawley & Co., with lots of other first-claes ngricultural machinery. Their Perpetnal hay baling prees wae much observed and favorably mentioned.

Brewster & Co., Roseville, Placer county, ehowed several of their iron sectional harrowe. They are hona fide, eubstantial implements which are meeting with euccese. They will hear the cloeest examiuation, and we can advice armeie to give them a trial.

Perkineon's flexible harrow, on the ground from Santa Roea, is highly recommended. It was recently illnstrated in the PRESS.

Naeh & Cutts' grain separator had the field to itself. It is a California invention worthy of the consideration of our farmere.

The Sacramento plow company are doing a good husinees in the manufacture of Ready'e gang and single plows. Tbe gang has been well tried and ie very popnlar in many parts of the State. Ready'e slip share, made of the best steel, ie a new patented improvement calculated to meet with favor, eepecially as a home prodnction. Mr. Ready aleo exhibited a new mower of simple oonstruction yet to be tested in thie State.

Haswell's Champion horse-power and pnmp combined ettracted much attention for its novelty. Drawings (which the inventor promiees ns), are necessary to give n good idea of the machine.

Lenikotter Broe.' horee-power for pnmping hae heen well tried and with euccess. They are simple and durable, and we should think calculated to give ample eatiefaction to farmers and othere. They also exhibited from their store, corner of 10th and J streete, an improved valve for snction and lift-pnmps which we may deeorihe hereafter.

The Pacific artesian and prospecting auger, Price & Morgan, patentees, Oakland, Cal., ie apparently a great improvement for well horing. We expect to give drawings of it in fnture. It hringe the dehrie to the snrface in a manner similar to the screw of an anger.

The Receipts.

We are not eble to give at this time the exact receipts hy the society during the fair, hut the *Bee* gives the following summary of the result: "The receipts of the week will not fell short more than $4,000 of last year'e show, when the fair lasted 10 daye. The expenees thie year were so mnch lees than leet that the profit will equal if not exceed last year'e figures."

State Fair Premium List.

The following are the awards for excellence in the eeverni departments mentioned, at the State fair at Sacramento, September, 1876:

Implements and Machinery.

Strsw hurning portable engine, California manufacture—Jos. Enright, prem and diploma, $25.

Imported portable straw hurning engine—M. C. Hawley & Co., diploma.

Portable Saw Company and Sweepstake Plow Company—Baker & Hamilton, honorable mention.

Patent shingle macbine, California manufacture—M. C. Hawley, $5.

Threshing macbine (Buffalo Pitts)—Baker & Hamilton, diploma.

Sulky and bay rake (Tiger Rake)—Baker & Hamilton, diploma.

Perpetual bay press—M. C. Hawley & Co., honorable mention.

Hay press, California manufacture, (Miller Press)—M. C. Hawley & Co., $40.

Feed Cutter—Keller & Co., diploma.

Sweep horse power, California mannfacture—Wm. Laufkotter, premium, $10.

Post anger, California manufactnre—M. C. Hawley & Co., $5.

Well auger—M. C. Hawley & Co., $5.

Horse power for pumping, California manufacture—Baker & Hamilton (Gillis power), diploma.

Header, California manufacture, S. B. Bowen, $50.

Imported header—Keller & Co., diploma.

Mowing machine, imported—Sacramento plow company, Superior mower, diploma.

Seeder—Keller & Co., Gorbam seeder, imported, diploma.

Broad-cast Seed Sower, California mannfactnre, $10.

Combined reaper and mower, imported—Baker & Hamilton (Buckeye), diploma.

Harrow, California manufactnre—E. Perkinson, (flexible harrow), $10.

Double shovel plow, California mannfactnre—Sacramento plow company, $5.

Cultivator, California manufacture—Sacramento plow company, $10.

One-horse cultivator, California manufacture—Sacramento plow company, $5.

Windmill, California manufacture—M. R. Bose, $25.

Farm gate, California manufactnre—E. L. Brooks, $15.

Grain separator, California manufacture—Nasb, Miller & Co., $5.

Farm feed mill, California mannfactnre—William Berringer, $10.

Apparatus for raising water for irrigating purposes, California manufacture, $20.

Pump well, California manufacture—Mr. Rose, $10.

Gang plow, California mannfacture—Sacramento plow manufacturing company, $100.

Gang plow (deep tiller), California manufacture—Baker & Hamilton, Sweepstakes Plow Co., $20.

Imported gang plow—M. C. Hawley & Co., John Deere plow, diploma.

Assortment of imported single plows—Frank Bros., Blackhawk patent, diploma.

Display of cast cast etesl, casting and chilled plow—diploma.

Sod plow, California manufacture—Sacramento plow company, $10.

Stubble plow, California mannfactnre—Sacramento plow company, $10.

Farm wagon for general purposes, California manufacture—J. F. Hill, $15.

Spring market wagon, California manufacture—J. F. Hill, $15.

Street goods wagon, California mannfacture—J. F. Hill, $5.

Two horse family carriage, California manufacture—J. F. Hill, $5.

Assortment of springs and axles—J. F. Hill, diploma and $10.

Imported farm wagon (Bain wagon)—Baker & Hamilton, diploma.

Hay loader (Foust's hay loader)—Keller & Co., diploma.

Plastering lathe, California manufactnre—T. A. Scheller, prem recommended.

Artesian and prospecting anger, California mannfactnre—Price & Morgan, prem recommended.

Patent portable field fence and gate, California manufacture—Von Bregman & Bryant, honorable mention.

Engine, Eastern mannfactnre—M. C. Hawley, diploma.

Hot air engine—Huntington, Hopkins & Co., diploma.

Fruit drier—Sacramento plow company, prem and diploma recommended.

One mortising machine, one scroll saw, one wood turning lathe; one circnlar sawing machine—Cshorn & Alexander, diploma for eacb.

One lawn mower, one sprinkler—Hnntingion, Hopkins & Co., diploma.

Beehives—C. A. Davis, $3 and diploma.

Fanning mill, $5; grain separator, diploma—Nash, Miller & Co.

Regulator windmill—M. C. Hawley & Co., diploma.

Refrigerator, California manufacture—E. K. Howes & Co., $5.

Feed cooker—George McDaniel, diploma.

Pump—Wm. Lanfkotter, $10.

Pump valves—G. D. Hopper, prem recommended.

Beer valves—G. D. Hopper, diploma.

Washing machine—E. K. Howes & Co., diploma and $5.

Butter worker—E. K. Howes & Co., $5.

Churn—E. K. Howes & Co., $10.

Clothes horse—E. K. Howes & Co., $5.

Milk cooler—D. N. Thorp, diploma.

Improved Little Giant machine for hydraulic mining, R. Hosken, special prem and diploma recommended.

Display of pumps—M. C. Hawley & Co., diploma.

Display of cordage—Tubbs & Co., of San Francisco, silver medal).

Hardware.

Five fire and hurglar proof safes—Detroit safe company, hy W. G. Williams, agent, Sacramento, $20.

Display of window blind and shutter trimmings (fastener and regnlator)—Bullard & Byam, Sacramento, $5.

Display of brass work—Hnntington, Hopkins & Co., Sacramento, diploma and $20.

Display of door trimmings—Huntington, Hopkins & Co., Sacramento, $5.

Display of locks—Huntington, Hopkins & Co., Sacramento, $5.

Display of window trimmings — Hnntington, Hopkins & Co., Sacramento, $5.

Display of lamps—C. E. Aiken, Nebraska, $10.

Display of general hardware—Huntington, Hopkins & Co., Sacramento, $10.

Display of table cutlery—Huntington, Hopkins & Co., Sacramento, silver medal.

Display of pocket cntlery—Huntington, Hopkins & Co., Sacramento, $5.

Hand saws—Hnntington, Hopkins & Co., Sacramento, $5.

Pruning shears—Hnntington, Hopkins & Co., Sacramento, $5.

Pruning knives—Huntington, Hopkins & Co., Sacramento, $5.

Display of anti-friction metal — Huntington, Hopkins & Co., Sacramento, $5.

Display of sbot—Huntington, Hopkins & Co., Sacramento, $5.

Display of block tin pipe—E. B. Mott, Jr., Sacramento, $5.

Three combination locks—Detroit safe company, by W. G. Williams, agent, Sacramento, diploma recommended.

One double chronometer bank lock—Detroit safe company, hy W. G. Williams, agent, Sacramento, diploma and silver medal recommended.

Window blind fastener and regnlator, Bullard & Byam, Sacramento, diploma recommended.

Cracking picks—John Henry, Sacramento, diploma recommended.

Mechanics' tools—Hnntington, Hopkins & Co., Sacramento, special mention recommended.

Table cutlery—Huntington, Hopkins & Co., special mention recommended.

Pockst cutlery—Huntington, Hopkins & Co., special mention recommended.

Railway car trimmings—Huntington, Hopkins & Co., diploma recommended.

English and American guns and pistols—Hnntiogton, Hopkins & Co., special mention recommended.

Horseshoe nails ready pointed—Huntington, Hopkins & Co., special mention recommended.

Tree pruner (Water's patent)—Huntington, Hopkins & Co., special mention recommended.

Burglar proof windows—George C. Batee, Sacramento, special mention recommended.

Eighty boxes horseshoe nails—Union horseshoe nail company, Chicago, Ill.; Hnntington, Hopkins & Co., Sacramento, diploma recommended.

Game trap—George U. Mayherry, Sacramento, diploma recommended.

Cooking stove for wood—L. L. Lewis, $5.

Parlor stove—E. B. Mott, Jr., $5.

Cooking stove for coal—L. L. Lewis, $5.

Warming furnace—L. L. Lewis, $5.

Cooking range, L. L. Lewis, $10.

Parlor grate—E. B. Mott, Jr., $3.

Ornamental iron vases—E. B. Mott, Jr., $3.

Specimen of marbleized iron—E. B. Mott, Jr., $3.

Portable range, E. B. Mott, Jr., $5.

Laundry stove—L. L. Lewis, $5

Display window blinds—Taft & Bennett, Sacramento, $5.

Display pine door, $10; best display turning latbe work, $5; column and pedestal, special mention; display fancy molding and scroll sbwing, $5—Hartwell, Hotchkiss & Stalker, Sacramento.

Display cedar ware, $5; display pine wars, $5; display oak ware, $5; display wooden ware, $25—E. K. Howes & Co., San Francisco.

Premium flonr safe — J. H. Taggart, Sacramento, special mention and diploma recommended.

Display of soap—Withington & Bagley, Saoramento, silver medal.

Display of stove polisb — Hun'ington, Hopkins & Co., Sacramento, $5.

Manufactures.

Display of leatber—Brown, McKay & Co., of Benicia, silver medal and $10.

Set double harness—J. T. Stoll, silver medal and $10.

Set single harness—A. T. Nelson & Son, $10.

Display of Mexican saddles—J. T. Stoll, $10.

Display of saddle and bridles—S. Roth, $10.

Display of saddle trees—M. Shink, $5.

Improvement on single harness—to shorten croup strap, raise hreecbing and hreast collar with bnt one buckis instead of four, as on ordinary barness—S. Roth, special premium recommended.

Improvement on Stoll's jockey saddle—bis own invention—J. T. Stoll, special mention.

Display of horse collars and borse boots—A. T. Nelson & Son, special mention.

Best exhibition of silk goods by one factory—R. Dals & Co., $25.

Best display of woolen goods hy ons factory—Capital woolen mills, $100.

Donble carpet coverlet—R. Dale & Co , $5.

Mackinac blanket—Capital woolen mills, $5.

Stocking yarn—Capital woolen mills, $3.

Silk hat—J. C. Meussdorffer, $5.

Soft hat—D. H. Quinn, Sacramento, $5.

Exhibit of men'e hats and caps—J. C. Menssdorffer, Sacramento, silver medal.

Collection of furs—D. H. Qainn, Sacramento, $25.

Display of colors in printers' ink—Horace P. Fletcher, San Francisco, diploma recommended.

Display of men's and hoys' boots and shoes—James Parsons, Sacramento, silver medal.

Display of ladies' and girls' boots and shoes—James Parsons, Sacramento, silver medal.

Pair ladies' gaiters—James Parsons, Sacramento, $3.

Pair gent's dress shoes—James Parsons, $5.

Pair Congress gaiters—J. Kaerth, Sacramento, $5.

Pair ladies' slippers—J. Kaerth, $3.

Two-horse family carriage—Carvill mannfacturing company, diploma and $30.

One-horse family carriage—California carriags mannfacturing company, diploma and $25.

Top buggy—Carvill manufacturing company, diploma and $20.

Two-seated open carriage — Carvill manufaoturing company, $20.

Trotting wagon—To J. F. Hill.

Farm wagon for general nse—To J. F. Hill.

Spring market wagon—To J. F. Hill.

Street goods wagon—California carriage mannfacturing company, $5.

Carriage for children—To Richard Dale.

Assortment of carriage trimming and material—Waterhouss & Lester.

Carriage springs—California carriage manufacturing company (Dolan & Scherb spring), diploma and $10.

Display of carriage wbeels, hubs, etc.—Waterbouse & Lester.

Exhibit of express wagons, farm wagons and carriages—J. F. Hill, of Sacramento, special prem recommended.

Best ladies' phaeton and best trotting huggy on exhibition—California carriage mannfacturing company, special prem recommended.

Best open hnggy on exhibition, Eastern manufacture—Studebaker Bros., special prem recommended.

Miscellaneous.

Display of California tobacco—O. A. Davis, $25 and silver medal.

Exhibit of hops—W. A. Haynie, $10.

For the most meritorious exhibition in the juvenile department, the committee awarded the Society's gold medal to Miss Carrie M. Taft.

Display of drugs, chemicals and perfumery, etc.—Kirk & Co., Sacramento, diploma.

Three wooden slat window shades—E. W. Brady, Davenport, Iowa, diploma.

Display of home manufactured candies and candy work—W. F. Peterson, Sacramento, special prem or medal.

Display of mirrors—Whittier, Fuller & Co., San Francisco, diploma.

Best general display of confectionery, including foreign work—H. Fisher, Sacramento, special prem or medal.

Two mammoth cucumbers—P. Wetzell, Sacramento, special mention.

Display of ornaments of California wood—Mrs. R. W. Brehm, San Francisco, special prem.

Fancy cigar case or stand—Mrs. Henderson, San Francisco, diploma.

Glass bottle puzzle—Mrs. N. S. Allen, Sacramento, special mention.

Model of portfolio for engravings (California invention)—Mrs. R. W. Lewis, Sacramento, diploma.

Printed advertisement of domestic patterns—L. Bien, Sacramento, special mention.

Display of ornaments made of California wood—G. F. Atkinson, Sacramento, special mention.

Display of California manufactured shell jewelry—R. W. Jackson, San Francisco, special prem and diploma.

Specimen shell work—R. W. Jackson, San Francisco, $5.

Gilt Edge yeast powder—H. G. Boisseller, Stockton, $5.

Display of blacking—Huntington, Hopkins & Co., Sacramento, $3.

Pottery, silver medal; roofing tile, $5; terra cotta, diploma; Buckinghem ware, diploma; stone ware, diploma—Bergman Bros., Sacramento.

Display of California marble—Aitken & Luco, Sacramento, $20.

Exhibit of salt—Theo. Winters, Reno, Nev., $3.

Wm. Gwynn, Sacramento—Hydraulic cement, $5; lime, $5; pressed brick, diploma; fire brick, $3.

Dressed stone—Aitken & Luce, Sacramento, $5.

Aquarium of fishes—E. B. Mott, Jr., Sacramento, silver medal.

Lubricators (California invention), machinery, oil, etc.—Huntington, Hopkins & Co., Sacramento, diploma recommended

Axle grease—Pitcher & Palmer, Sacramento, diploma recommended.

Display of coals (California and other varieties)—Jacob Hoehn, Sacramento, diploma recommended.

Salamander felting company, Seward Cole manager, San Francisco, diploma and special mention.

Display of glue—C. Weisel & Co., Sacramento, $5 and diploma recommended.

Guild & Church pianos—Special prem recommended.

Smith's organs—Special prem recommended.

Display of paper hangings and borders—C. H. Krebs, Sacramento, $5.

Electric machine—Fisk & Gill, Sacramento, diploma.

Breech-loading shotgun (California make)—A. Flohr, Sacramento, $5.

Sporting rifle (California make)—A. Flohr, Sacramento, $5.

Game-bag (California make)—A. Flohr, Sacramento, $3.

Surgical instruments—G. A. Stephenson, diploma.

Diploma and special attention recommended to R. Phillip for display of die-sinking etcuci1, etc. Also, a diploma to J. P. Dixon for Dixon's reticule bracket; diploma to Henry Eckhart for display of [illegible]. Also, recommended that a gold medal or diploma be awarded the National fire alarm telegraph company, Fisk & Gill, agents, Sacramento for a specimen of the system. Also, that a special medal or a silver medal be awarded A. Flohr, Sacramento, for display of firearms, cartridge-carrier, shot bag, gun material and fishing tackle. Also, a diploma to A. Hallidie, of San Francisco, for fire extinguishers, and a diploma to H. C. Kirk & Co., for display of drugs and perfumery.

Toilet soap—Alta soap company, San Francisco, diploma

Samples of paint (California make)—O. H. Krebs, Sacramento, $5.

Prussian blue—Whittier, Fuller & Co., $5.

White lead—Whittier, Fuller & Co., $5.

Jesse Healy & Co., of San Francisco—Pacific rubber paint, exhibited by Whittier, Fuller & Co., silver medal awarded.

Examples of paint as exhibited by I. L. Merrell & Co.—honorable mention.

Display of California minerals—Charles Allman, Sacramento, silver medal.

M. S. Hammer, Sacramento—Hammer's compound syrup glycerine of tar, diploma recommended.

Eugene Ruby—Display of cleansing soap, Alta Soap Co., San Francisco, box borax soap, diploma and special and honorable mention recommended.

F. M. Leaf & Co., Sacramento—California yeast cake, diploma and $5.

G F. Atkinson, San Francisco—Smith Bros., chemical refined borax, $5 recommended.

Sample varnish—J. L. Chadderdon, San Francisco, $5 and diploma recommended for display; also, a diploma recommended for artist and finishing brushes, and a diploma and $5 recommended for wax flower material.

I. L. Merrill, San Francisco—diploma recommended for sample of asbestos from the Merrill mine, Placer county, California; also, a diploma recommended for steatite roofing, soapstone pulverized, improved and pulverized talc and fire brick.

S. Cole, San Francisco—diploma recommended for samples of Eestern, Californian and Italian asbeetos, and a premium of $5 recommended for his sample of asbestos material and silver medal recommended for sample of steatite boiler and steam pipe covering.

Display] of mechanics' tools—W. F. Palmer, San Francisco, $10.

Display of chandeliers and globes—Bush Bros., Sacramento, $10.

Display of home production of manufactured mechanics' tools—W. F. Palmer, San Francisco, diploma and silver medal recommended in addition to the premium offered.

Display of chandeliers and globes—Bush Bros., Sacramento, diploma recommended.

Display of garden and lawn wire work—A. S. Hallidie, San Francisco, diploma and silver medal recommended.

Family sewing machine—Wheeler & Wilson, San Francisco, medal and $100.

Special prem recommended to J. A. Stewart & Co., for best pleating machine; also, special mention of miniature steam engine for running sewing machines, exhibited by Samuel Hill (made by Ed. F. Verrill); and honorable mention of sewing machine attachments exhibited by D. W. Campbell, of Sacramento.

A dispatch from Melbourne says that the steamship *Dardening*, from Melbourne to Sydney, foundered near Jervis bay during a hurricane on the 10th instant. Sixty of the crew and passengere were drowned.

Woodward's Gardens embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Housee, Menagerie, Seal Ponds and Skating Rink.

The Itch, which is a protean disease, and undoubtedly of animalcular origin, can only be effectually and permanently cured by sulphur. Glenn's Sulphur Soap presents the remedy in its most agreeable and effective shape. Sold everywhere.

A refrigerator car containing 4,000,000 of salmon eggs left Sacramento by the passenger train on Tuesday last, consigned to Professor Baird, U. S. fish commissioner, and in charge of Livingston Stone. The eggs are made up into packages, addreseed to such State fish commissioners as have applied for them, and will be delivered to the expresse companies as the car passes the station nearest their destination. The first will be delivered to Utah, and the last about a week later, to the Centennial exhibition.

Knight's American Mechanical Dictionary is a book for all persons who make, buy, sell, use, or want to know anything about tools for machines, or are curious as to the history and development of mechanic art. It is a descriptive word-book of tools, instruments, machines, chemical and mechanical processes; civil, mechanical, railway, hydraulic and military engineering; a history of inventions; general technological vocabulary; and digest of mechanical appliances in science and the industrial and fine arts, etc. For circulars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is the title of an illustrated work for miners and prospectors by Chas. H. Aaron, which will be issued immediately by Dewey & Co. Mr. Aaron has managed to give a great many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, 'Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, hae something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amelgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, went of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Nolce's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leeching apparatus, with two or three different arraagements, a small mill, sampliog tailings and settling tanks, dichloride of copper, etc.

The book is a serviceable one for miner's and prospector's use. Price, post free, (in leather,) $2.00. Address Dewey & Co., Mining and Scientific Press, 224 Sansome street, San Francisco.

Mining and Other Companies.

Mariposa Land and Mining Company

of California. Location of principal place of business, San Francisco, Cal. Location of works, Mariposa county, Cal. Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh day of September, 1876, an assessment, No. 7, of one dollar ($1) per share was levied upon the capital stock of the Corporation, payable immediately in United States currency, to the Secretary, at the office of the Company, room 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal., or to the Assistant Secretary at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the ninth day of October, 1876, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday the thirtieth (30th) day of October, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

LEANDER LEAVITT, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

Mariposa South Mining Company—Location

of principal place of business, San Francisco, Cal. Location of works, Spanish Belt Mining District, Nye county, Nev.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1), levied on the eighth day of August, A. D., 1876, the several amounts set opposite the names of the respective shareholders, as follows:

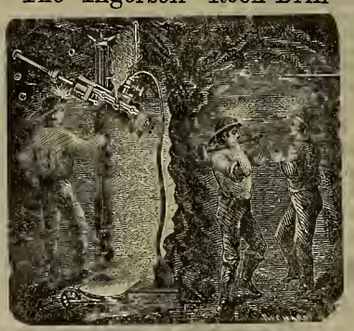
Machinery.

The Ingersoll Rock-Drill



Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

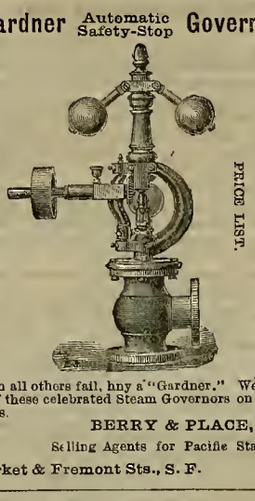
Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and HAS AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

426 California Street

The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE. EVERY ONE WARRANTED.



SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

☞ When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for Pacific States,

Cor. Market & Fremont Sts., S. F.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

DEETKEN'S

ROASTING FURNACE,

For Gold, Silver and Copper Ores.

The roasting capacity of the Furnace, per 24 hours, is from 6 to 50 tons, according to percentage and nature of the sulphureted ore, with an expenditure of one and a half to two cords of wood, and two to three shifts of unskilled labor, according to amount of ore handled. The Furnace is adapted for chloridizing, as well as oxidizing, roasting, and for the manufacture of sulphuric acid. In point of cheapness of construction and efficiency in working, the Furnace is far the best in use. Millmen in need of a cheap and efficient Roasting Apparatus will apply to

G. F. DEETKEN,

Consulting Metallurgist, Grass Valley, Cal.

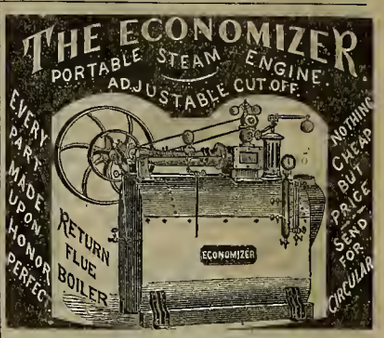
Furnace can be seen on application for permit, at Grass Valley.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 426 California street, Room 1.



—FOR—

Cotton Gins, Printers, Cheese Makers Laundries, Cabinet Makers, and All Manufacturing where Light Power is Required.

A. L. FISH & CO.,

Sole Agents for California,

9 and 11 First Street, - - San Francisco.

Marine Screw Engines

And BOILERS for driving Model Yachts from one to ten feet in length, and Row-Boats or Skiffs 16 feet and upwards in length; either plain castings, partly finished, or complete ready for use, so constructed that a speed of from six to twenty miles per hour can be easily obtained.

The Engine can be quickly detached from the Yacht or Boat, and is then suitable for Agricultural, Domestic, Mechanical, Commercial or Amateur requirements, when small power only is needed.

☞ 100 Scroll Work Designs free on receipt of Stamp.

GEO. PARR, Buffalo, N. Y.

NOTICE TO PARTIES ORDERING FURNACES.

The mining public is hereby notified that all persons who represent themselves to be my agents or to have authority under my patents to build and use, or to contract with others for the right to build and use a Cylindrical Rotary Roasting Furnace (except in Lander county, Nevada,) are frauds, and any person or persone that constructs one of my furnaces either with or without additions, alterations, or supposed improvements, or attempts to use one constructed under a contract with any such unauthorized person, will be prosecuted as infringers of my rights on the premises. I have made arrangements to have all my furnaces constructed by the Etna foundry, in this city, and no other foundry has a right to make one without my written consent. For rights to build and use, address

GEO. W. WHITE, Patentee, care of Etna Foundry.

San Francisco, Aug. 22d, 1876.

LEVI STRAUSS & CO.,

Patent Riveted

Clothing,

14 & 16 Battery St.,

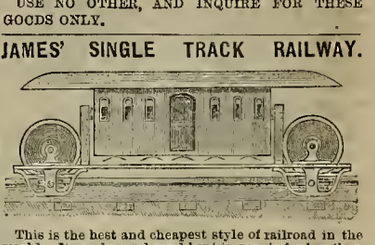
San Francisco.

These goods are specially adapted for the use of FARMERS, MECHANICS, MINERS, and WORKING MEN in general. They are manufactured of the Best Material, and in a Superior Manner. A trial will convince everybody of this fact.

Patented May 12, 1873.

USE NO OTHER, AND INQUIRE FOR THESE GOODS ONLY.

JAMES' SINGLE TRACK RAILWAY.



This is the best and cheapest style of railroad in the world. It can be made and kept in repair for less than the cost of a county road. It can overcome any grade, and make any curve. Can be run on wood or iron (wood the best). It places railroads within the reach of any village. Can be used to great advantage in transporting coal, ore, gravel, rock, lumber, or any class of freight. Any company or persons desiring a cheap and safe railroad will do well to correspond with

DAVID B. JAMES, Visalia, Tulare Co., Cal.

D. LANGELL'S ASTHMA & CATARRH REMEDY.

Having struggled twenty years between life and death with **ASTHMA**, I experimented by compounding roots and herbs and inhaling the medicine. I fortunately discovered a sure cure for **ASTHMA** and **CATARRH**. Warranted to relieve any case of Asthma instantly, so the patient can lie down to sleep. By mail, **$1.00** per box. Address

An intelligent lad, 13 years old, wants a permanent home in the country. Address J. B. PORTER, dentist, Oakland, Cal., or at this office.

GOLD MEDAL

AWARDED TO

San Francisco Steam Pumps.

PREMIUM AWARDED TO W. C. WILCOX & CO., FOR BEST STEAM PUMPS. Wilcox's Patent. 1875.

We are prepared to furnish PUMPS UNDER CONTRACT, guaranteeing their ability to perform any specific work for which steam pumps are adaptable, such as

RAISING WATER FROM MINES

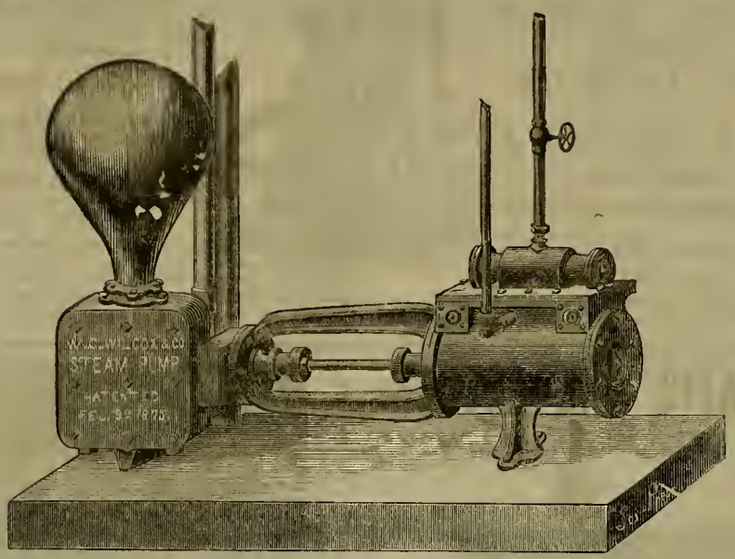
FOR WATER WORKS,

FEEDING BOILERS, RAISING WATER FROM WELLS; STEAMER AND SHIP PUMPS, ETC.

We would also call the attention of those interested, to our Direct Acting Deep-Well Pumps for raising water from

Any Desired Depth.

Also to our Especial Construction of Pumps FOR HANDLING QUICKSILVER or heavy liquids.



AFTER ONE OF THE

MOST THOROUGH TRIALS

Ever Had in the United States,

BETWEEN COMPETITORS

—OF—

Best Established Reputation,

In which, at great expense, the different Steam Pumps were tried under every test known to experts, the Examining Committee of the Tenth Industriel Fair of the Mechanics' Institute have awarded to us their

GOLD MEDAL

—FOR—

Best Steam Pumps on Exhibition.

We claim thet our Pumps are the **best** ever made in **simplicity** of construction, economical use of power, **durability** and perfect adaptebility for generel uses, and we ask all persons interested to investigete **our title to this claim.** Selesroom at our Mechine Shop, 114 and 116 BEALE STREET, SAN FRANCISCO.

W. C. WILCOX & CO., Proprietors.

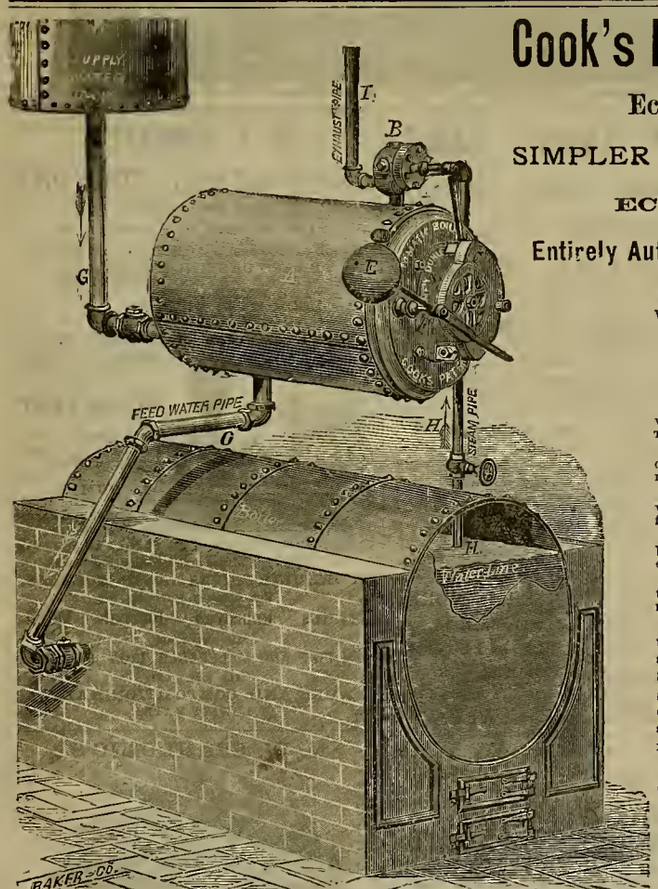
Cook's Patent Automatic Boiler Feeder & Regulator.

Economy in Operation. Absolute Safety from Explosion.

SIMPLER THAN A PUMP, AS IT REQUIRES NO ATTENTION.

ECONOMY IN FUEL.

Entirely Automatic, Reliable & Durable.



Cook's Automatic Boiler Feeders

WERE AWARDED THE HIGHEST PREMIUM OVER ALL MACHINES EXHIBITED AS BOILER FEEDERS AT THE CINCINNATI EXPOSITION AND THE ST. LOUIS FAIR.

The cuts show the operation of the Feeder. It was described in detail in the MINING AND SCIENTIFIC PRESS of May 20, 1876.

This Feeder will discharge from 40 to 200 gallons of water at one movement, where a pump would require hundreds of strokes to do the same work.

The water is kept exactly at the proper line, whether running fast or slow, without attention from the engineer.

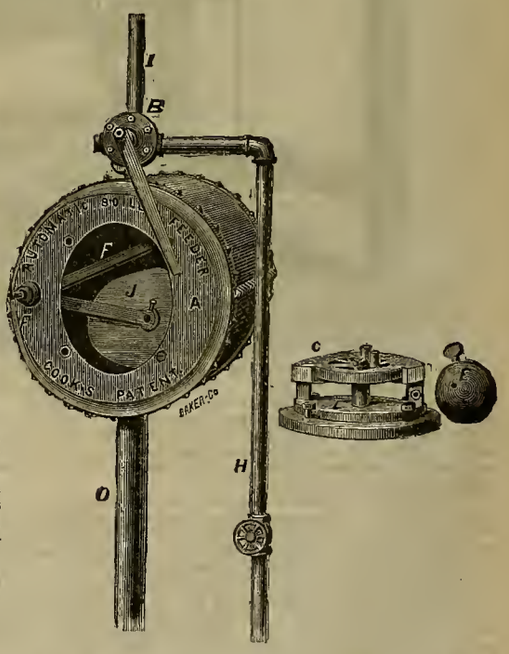
Feeders, Heaters and Regulators Combined are made on this principle. Simple and economical.

The control of feeding water to the boiler is taken out of the hands of the engineer and left to unerring natural laws.

These Machines are now introduced on this coast for the first time, although they are extensively used in the Eastern States. They supply the boilers with great regularity, and keep the water at exactly the same level. As a protection against explosion they are simply perfect, leaving nothing to be desired.

ONE OF THESE FEEDERS CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS.

Address,
For Circulars and further information,



Pacific Iron Works, First and Fremont Streets, near Howard,

SAN FRANCISCO.

F. MANSELL & CO.,

SIGN PAINTERS,

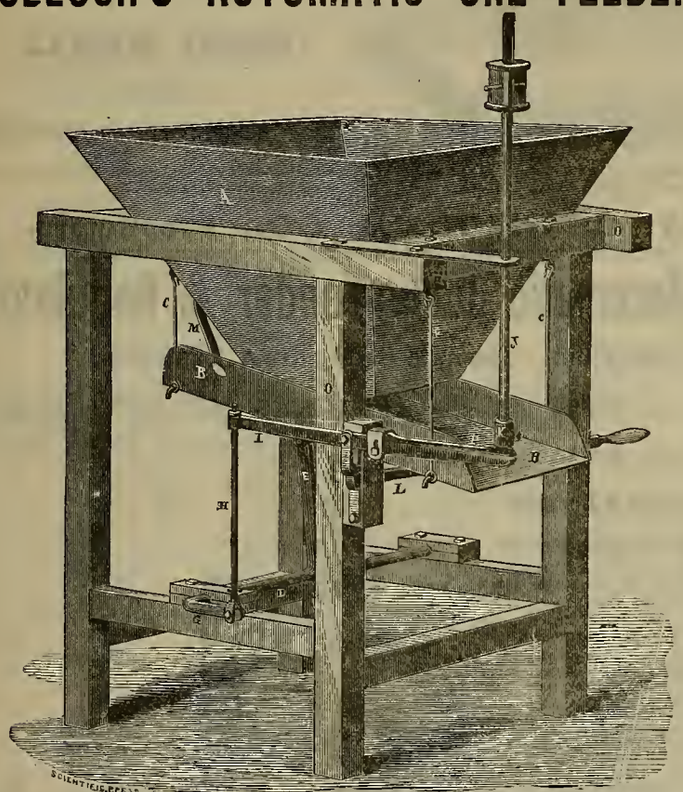
Large Assortment of

MORSE TWIST DRILLS.

HASKINS' PORTABLE HOISTING ENGINES, constructed especially for economical use in mining districts, with Compressed Air or Steam, adapted to all classes of underground work and made throughout on the interchangeable plan, so that all parts can be duplicated when desired. Catalogues and Estimates given on application.

TULLOCH'S AUTOMATIC ORE FEEDER.



The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone $48 a day. Mr. Green, of the Phœnix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Presto writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 417 Market Street, S. F.

SANTA CLARA, CAL., April 6th, 1875.

MESSRS. DEWEY & CO.—*Gents:*—We have just received Patent No. 160,535, for J. T. Watkins & Co's Mammoth Road Grader, which was patented through your Agency. It is the neatest and best that we have ever received. We feel proud of it and thankful to you for the care and attention that you have given it, and when we have anything to do in that line of business we will surely give you a call. Very respectfully,

J. T. WATKINS & CO.

VOLUME XXXIII. Number 15.

What a Patent Agent Ought to Be.

[For the MINING AND SCIENTIFIC PRESS, by JOHN L. BOONE.]

A patent agent ought to be careful and honest, because he is the repository of his clients' secrets. No class of property is more highly valued by its possessors than that which derives its origin from invention. No matter how trifling the idea may be, the person who conceives it is apt to place a much higher estimate upon its value than others, and he is therefore jealous of its possession. This jealousy is exceedingly commendable, however, on account of the fragile nature of the tenure by which he holds possession, and because his title cannot be permanently established until the patent is actually allowed and issued. An improper exposure or unwise placing of confidence in a third party by the inventor or his confidents is liable and often has cost the inventor not only time and money to obtain his rights, but has entailed the entire loss of his invention.

It is therefore necessary that the patent agent or attorney should not only have the confidence of the inventor, but that he should carefully guard the interest of his client and see that no injudicious exposure or explanation is made that parties liable to create trouble can get hold of. The utmost confidence ought to be maintained between an inventor and his attorney or agent.

A patent agent ought to be patient. Inventors are proverbially tedious. They like to talk about their inventions, especially to the person whom they have employed to prepare their patent papers and attend to prosecuting their applications. This is also excusable, because it relieves the mental pressure. It is the inventor's safety valve. Fear of exposing his secret to others compels him to keep it locked up in his brain, and there it lies unfolding itself, expanding in value and importance and permeating every tissue of the human anatomy until the accumulated pressure is relieved by a distribution of the burden with a confident, and the patent agent is usually that confident.

The agent should patiently listen, for the talk of an inventor is valuable to him. It gives him the inventor's peculiar ideas, and if he is a student of human nature, it enables him to frame the case so that the inventor will be satisfied with it in every particular.

The patent agent should be accommodating; inventors are often whimsical, the very nature of their undertaking is apt to lead them to peculiar theories and incorrect conclusions, although the general result of their theories and conclusions may be correct. These theories the agent must not combat, unless they are vital and enter into the essence of the case. He had better let their possessor retain them than incur his distrust and possible enmity by opposing them. The inventor will find his errors when he comes to enter upon the actual and practical field of operation.

The patent agent must be familiar with the law of patents, otherwise how can he guard the vulnerable points of the invention? Every specification must be prepared with a view to its having to pass at some time or other through the ordeal of a judicial examination, and a judgment as to its validity and scope, and unless the person who prepares the specification fulfills the legal requirements, and in a legal manner sets forth the description and claims, the patent will not stand.

No general knowledge which he may possess will make up for the want of legal knowledge; it is the one thing that may defeat the end sought, if it is not properly possessed and properly employed.

The patent agent must be a mechanic, theoretical, at least. In this particular patent agents must be qualified by nature, and not by education, although education is necessary to enable him to dress his mechanical points in proper language and render his points plain, certain and intelligible. Technical knowledge of each particular art, trade, or profession is not required, but a general knowledge of the various steps and requirements are necessary. A person who possesses the inventive faculty, if otherwise qualified, makes the best patent solicitor; he can then see each invention through the same medium and in the same light that the inventor himself sees it; he can pick out and embody the small mechanical points that form the real safeguards of a patent, and thus more absolutely prepare the case for the scrutiny of judicial investigation and the criticism of mechanical experts.

Few men possess all of these qualities, therefore we might say that few men are competent to serve as patent solicitors. The want of proper qualification in patent agents is the cause of so many worthless patents being issued from the patent office. The inventor must absolutely depend upon the preparation of his case for his security and defense, and it therefore behooves him to examine into the character and qualifications of the person in whose hands he places his invention and secret.

The safest and best guide for inventors who require the services of a patent agent is to choose those who have been long in the business and who have acquired a settled reputation for integrity and capacity. Mushroom patent agents exist everywhere. They employ the most specious means to entrap the uninformed inventor, but their services are an actual damage nine times out of ten. It is an hundred fold cheaper to pay a competent attorney or agent a fair fee than to accept the services of such men for nothing.

AN IMPORTANT DECISION.—A recent decision by the Commissioner of Patents and concurred in by the Secretary of State and Secretary of the Interior of the United States, establishes a feature in connection with our trademark laws that is of great importance to foreigners. It is that subjects of Great Britain, residing and doing business in a foreign country, cannot register trademarks under our law. The case under which this decision was rendered was as follows: On the 11th day of May, 1875, Messrs. F. Chevalier & Co., of San Francisco, California, registered the words "Old Castle" for whiskies. They retained undisputed possession of this mark until February, 1876, when Walter and Alfred Gibbey, of London, England, filed an application to register the same mark, and demanded an interference with Messrs. Chevalier & Co. We were retained by Messrs. Chevalier & Co. to defend their interest, with the above result. The decision is important, as it regulates the status of British subjects residing and doing business in a foreign country in regard to trademarks in the United States.

MARTIN FARQUHAR TUPPER, the English poet, is on his way to California.

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

Q. Lazulils (Azure Stone).

A beautiful blue mineral, sometimes used as a gem. Is named from the Arabic word *azul*, signifying the heavens. Crystalline form, monoclinic; hardness, 5-6; gravity, 3.057; luster, vitreous; color, azure blue to fine deep blue; streak, white; subtransluscent, opaque; fracture, uneven; brittle. When pure it has the following composition: Phosphoric acid, 43.88; alumina, 31.79; protoxide of iron, 890; magnesia, 9 89; water, 5.56=100.00.

In a matrass yields water and loses its blue color. B. B. on charcoal intumesces slightly, assumes a glassy appearance, but does not fuse. With borax forms a clear, colorless globule; with cobalt solution gives a fine blue color, when strongly heated. Colors blow pipe flame slightly green. Scarcely acted on by acids in its natural state, but after heating becomes soluble.

This mineral occurs both crystallized and massive. The massive varieties traverse clay slate.

Good specimens of lazulite are very pretty, but they are neither fashionable nor much admired in jewelry.

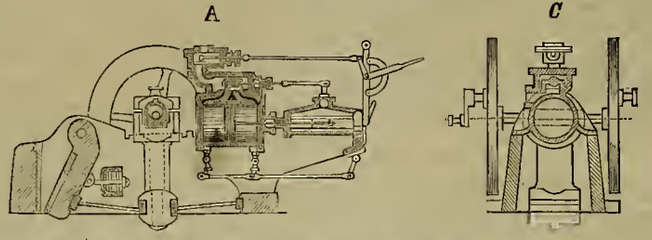
R. Cyanite, Kyanite.

Triclinic; hardness 6.-7.25; specific gravity, 3 45-3.7, (white 3 559), (blue transparent 3,675); color generally pale blue; crystals often soft on lateral surfaces and hard on extremities; luster, vitreous, pearly; streak uncolored; translucent, transparent. Although generally blue it is sometimes white (rhœtizite), also gray, green and black. When pure has the following composition: Silica, 36.8; alumina, 93 2=100 00; often impure from admixture with oxide of iron and other foreign substances.

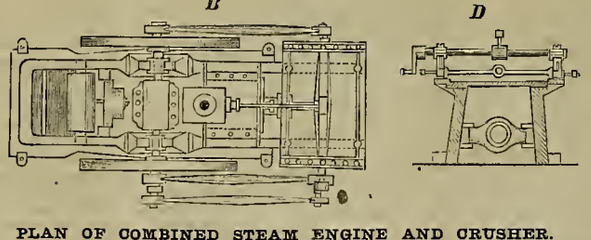
B. B. unaltered. With borax fuses slowly to a colorless glass; with cobalt solution gives a dark blue color. Occurs in gneiss and mica slate. Found both massive and in crystals.

The electrical properties of cyanite are remarkable, for, according to Cleaveland, the crystals when electrified are sometimes positive and sometimes negative. When cyanite is found in pieces sufficiently large, and when transparent and of a pure blue color, it is much prized as a gem, being substituted for the sapphire. The name is derived from a Greek word signifying blue. Cyanite is found in numerous localities in the Eastern States, but is as yet unknown on the Pacific coast.

BONANZA BOUNDARIES.—If Mr. Attwood's statement is correct, that branch fissures carry the different ore bodies in the Comstock lode, we imagine the limit of each bonanza may be easily estimated, as the foot wall of the main fissure would form the boundary.



ROCK CRUSHER COMBINED WITH STEAM ENGINE.



PLAN OF COMBINED STEAM ENGINE AND CRUSHER.

[Copyrighted.]

Mechanical Ore Concentration and Separation.—No. 8.

(Written for the PRESS by FRANCIS F. M. CAZIN, M. E., Santa Fe, New Mexico.)

Breaking the Ore.

We will continue the discussion on how far breaking the ore should go and with what machinery it should be done. Would it serve any practical purpose to break, into the size of a pea or bean, ores carrying the metallic part disseminated very finely in the rock (gold in quartz). Would not the single pieces carry both rock and valuable parts connected? What could separation by specific gravity do with them unless first broken so as to really set apart the particles of one quality from the particles of the other? By loosening one from the other their mixture may be dealt with by the proper action, utilizing the difference in their gravity.

It takes the experience belonging to the trade to decide the size to which a special ore should be broken or divided, but with proper consideration of the above remarks the correct conclusion can always be come at as close as required by practice.

Crushing Machinery.

Once the size is decided upon, the selection of machinery is a matter of experience. The breaking machinery may be distinguished in machines for breaking into one coarse, two middle and three fine sizes; but the action of either will infringe on the department of the others. They are: 1st, crushers; 2d, rollers or grinders, and 3d, stamps or pulverizers. One and the other may be combined, or be a separate contrivance.

Leaving the Blake and Dodge crusher for consideration further on, we give engravings, *A*, *B*, *C* and *D*, showing the construction of a rock breaker combined with a steam engine.

The difference between this crusher and Blake's is that the crushing jaws have no alternate ribs, but are flat, it being considered that they will maintain shape for a longer time and do more uniform work without ribs than with them. The scale to which the figures are drawn is one-fourth of an inch to one foot. The jaws can be so arranged as to break the rock in pieces from two inches down to three-fourths of an inch. The motion of the movable jaw is regulated by more or less lining being put in between the swing crank and its base where fitting to the crank shaft. From 200 to 250 revolutions will give proper effect for breaking ores, and 160 to 180 for breaking to a small size. The rock in passing the crusher is broken so as to yield 80 per cent. of the coarser kind, and about 20 per cent. of the smaller sizes, but with loose sand rock the percentage of smaller rock is higher.

THE INTERNATIONAL EXHIBITION OF 1876.—Bayard Taylor, the eminent traveler and writer, who has been a careful observer and attendant of all the great exhibitions throughout the world for the past 25 years, says of the display at Philadelphia: "Taken as a whole, the exhibition surpasses all its predecessors in beauty of position, convenience of arrangement and variety of interest."

GENERAL NEWTON announces that the roof at Hallet's point has been swept away, and says: From 180 feet distant from the shore line to the line of buoys, the bottom slopes from eight feet of depth at low water to 20 feet outside the line of buoys. There is not less than 20 feet depth at low water. The divers have been examining the reef, and report a thorough break-up.

THERE is a grasshopper invasion in some counties in Texas, and they are destroying vegetation. Sowing has been delayed until it is ascertained whether the hoppers will remain long enough to deposit their eggs.

EDWARD BITTENBENDER, who murdered his brother and was sentenced to life imprisonment, committed suicide in the county jail last week.

CORRESPONDENCE.

Some of the Mines of Nye County.

[From our own Correspondent.]

The South Barcelona.

Which is a southern extension on the Barcelona Consolidated has a similar character of ore, carrying, however, much more of the ruby silver. In addition to the work heretofore done in the development of the mine, two drill holes had been made, one 170 feet east of air shaft, and another 180 feet further east in a line with a large joint tunnel, seven feet by seven in the olear, now being vigorously run by the Barcelona Consolidated and the Barcelona South, which will strike the main Barcelona ledge at the depth of 680 feet from the surface, in accordance with surveys made on the ground. This tunnel has been extended 310 feet and is within 30 feet of the Oriental ledge, crossing which there will be only 300 feet more to run bsfore tapping the main ledge, when some rich developments may be expected, as some very high grade rnby ore is said to have been strock by the diamond drill in one of the perforations alluded to, at the depth of 138 feet, for which point the South Barcelona tunnel is now driving. A nice little vein of cinnabar was cut in its oourse, which went, after retorting, as high as 40 per cent., and may prove of great value

Mr. Harvey, to whom I was referred, in absence of the superintendent, for information in regard to the South Barcelona, was nnfortunately not interviewed as to some points of interest, particularly as to the amount of ore extracted, or as to yield per ton. Madam Rumor, (sometimes good anthority), put much of it at from $40 to $50 per ton, some lots at $180, with a little choice first class, as high as $800. It also is numbered among the promising mines of the district, hut it may be several months before its trne status can be fully determined, as this will depend much on the result of developments in progress.

The Spanish Belt,

Adjoining the last described, has an incline on the ledge 118 feet. A cross-cut had heen run 20 feet through the vein without reaching the hanging wall from which they were taking ore, principally low grade. It had been worked only ahout two months. The indications were considered very good, with some assays as high as $270 per ton.

The Barcelona Central,

Mr. J. B. Hollis, euperintendent, was sinking a straight shaft, which was down about 75 feet on the east side of the ledge. Assays from near the surface went all the way from $50 to $1,000 per ton.

The Mariposa South

Has an incline 110 feet, following the hanging wall, and a cross-cut 10 feet, said to prospect favorably, with some good ore found all through the vein. The tunnel is 320 feet in length; crossed one very promising ledge and had not reached another for which it was running. The outcrop of the back lode was very large, it is said, and carrying good ore.

The Valenciana—tnnnel, 215 feet; cross-cnt 80. Ledge not yet reached. The San Francisco had a nice stratum of ore exposed, but little work has been done. Along the same helt were the Homming-Bird, the Summit, the Pennsylvania and other locations not at present worked.

On the North

Of Barcelona City about a mile, the Eclipse had sunk a shaft 85 feet and run a cross-cnt 40 feet—all ledge matter, with some good ore.

The Transit, lying next north—tunnel 300 feet—had just cut into ledge 8 feet, ore so far low grade, formation good; ledge well defined. The Spanish Consolidated, Original Yellow Jacket, not far from the last mentioned, had crossed a fine little vein two and a half feet in width, thonght to be a spur from the main ledge, giving assays from $50 to $80, the latter expected to be reached by a run of 60 to 70 feet further.

Silver Hill,

Abont three miles from town, on the same mineral belt, the property of Messrs. Barrows, Ditmar & Harding, has had abont $400 worth of work done on the claim, the ledge being traceable for more than a mile. Assays from croppings, $18 to $68 per ton. Tunnel now running to reach the ledge at the depth of 200 feet.

San Pedro Mining Company,

Mr. L. A. Gould, superintendent and chief owner, has commenced to run a seven by seven feet tunnel, similar to that of the Barcelona Consolidated and the Sonth Barcelona, for one or two ledges standing out in bold relief at a considerable hight above the surface and extending along the side of the mountain. The principal ledge will be tapped at the depth of 400 feet. Here was noticed, and being got in readiness for operation, one of the Morse diamond tunneling drills, a similar pattern having been seen on exhibition last year at the Mechanics' fair, in your city. Immediately adjoining and belonging to Mr. J. R. Seymour, of Belmont, are the Cosmopolitan—linear extent, 1,500 feet—and the Clipper, below, 600 feet. A short incline had beeu run on the former, and a cut of 90 feet in length and 10 feet in depth had been made on the other. The San Pedro, as well as the Cosmopolitan and Clipper, gives good fair assays, and all havs the usnal favorable indications of the district.

A Cinnabar Discovery.

Abont three miles southwest of Barcelona City, a very promising vein of this mineral is said to have been found, on which about a dozen locations have been made. A brief description of the Maryland, belonging to Messrs. Oberdorf, McCrea et al, will snffice for all and close the accounnt of Spanish Belt. Ths cinnabar is found in a vein running through the granite, in connection with spar, near the surface, cropping out from 10 to 15 feet, but said to change to porphyry as it was followed down the distance of 12 feet, the greatest depth as yet reached. It assays from two to 24 per cent., and was looked npon as an important discovery.

Belmont District.

Belmont, 90 miles south of Austin, is rather a neat and comparatively flourishing mining village, of about 500 inhahitants, giving a good support to at least one weekly joornal, the Belmont *Courier*, and very justly hoasting of having one of the handsomest brick structores in the State, wherein even-handed justice is meted out, it is presumed, in strict accordance with law—*lex scripta* as well as *lex non scripta*, as the lawyers would say. At any rate, several intelligent gentlemen of the legal fraternity were met with here, together with many mechanics, miners and citizens, directly or indirectly interested in the development of the mines of the country, who were unmistakahly very appreciative readers of the MINING AND SCIENTIFIC PRESS. A constant reader and a wide-awake mechanic of the place gave me some very interesting facts in reference to the

Pecuniary Value of Your Paper,

Which I regret not noting down at the time, as the illustrations were so apropos and so much to the point; the gist of the matter, however, being that he had realized many times the amount of the subscription, in a moneyed point of view, saying nothing of the intellectual treat served upfrom week to week in the columns headed, "Scientific and Mechanical Progress," or under the more general caption, "Useful Information." Many oases might be reported of the valne of the PRESS in this respect, where single articlss led to the realization of larger or smaller amonnts; one gentleman in Sacramento having, from a paragraph on "Lead Pipe," made the snug little sum of $500 within the space of a couple of months. I hope you will pardon this little disgression, as it might meet the eyes of some one who thinks he cannot afford to subscribe for the PRESS, when, in fact, if he only knew it, he cannot well afford to be without it.

The Mineral Deposits of Belmont

District, are bounded with granitic rock on the west, extending in a northerly and soutberly direction, and on the east by the slate and quartzite. In accordance with the view of Mr. W. F. Leon, superintendent of the El Dorado South, a gentleman of much prnctical experience and apparently well versed in the geological formation of the country, there is here one large, true fissure or mother vein, from its gangue and salvage helieved to be similar in kind and cheracter to some of the most celebrated mines of the world.

Excepting abont 250 feet at the southern extremity, the vein is plainly traceable throughout the entire property of

The El Dorado South,

Which consists of 1,000 feet, covered hy U. S. patent to W. F. Leon & Co., saiö to be the first issued for mining property and signed by Andrew Johnson. It presents all the characteristics of a true fissnre vein; the formation, slate. The contents of vein consist of a "camphory" looking quartz, richly clouded with black and antimonial snlphurets of silver, which are represented to be in a more or less advanoed state of chlorinization ahove the water line.

The pay stratum is found at times permeating the entire vein, at other times in chloride strata above the solid ledge. The ores consist chiefly of beautiful crystallizations, including native or metallic silver, a combination of silver and antimony, horn or chloride of silver, sulphurets of silver and iron, stromeyerite, stetefeldtite and carbonate of copper; the best ore heing associated, uanally, with the oxide of oopper and irou. In such cases, the percentage of silver is very great, amounting at times, to 25 per cent. of the entire mass. Formerly the mine was worked by an incline from the croppings. Large quantities of chloride and sulphuret ores were extracted, yielding to date over $1,000,000, the average per ton being given at $100. It is now bsing systematically opened by a perpendicular double-compartment shaft, to tap the ledge at the depth of several hundrsd feet, after which there will he sofficient backs of ore to rnn the company's 20-stamp mill for many years, the same being so conveniently situated that the ore can he dumped into its ore-chambers from the shaft. Tbe pay shntes formerly worked were from three to fiftesn feet in width. The depth of the Leon ehaft, alluded to, is at present in the neighborhood of 420 feet. The 300-foot level has been extended nbout 90 feet, and the 400-foot level about 200 feet. In connection with this property of the company, they also own the Arizona, from which large hodies of chloride ore have been taken. On the south of the company's ground is the Josephine, although as yet worked to no great depth, nnd it seemed to be the general impression among miners here that nll the bodies of ore fonud in the former will run also into the Josephine, and, in consequence, considerable hopes are entertained for the fntnre. Owing to the absence of the snperintendent of

The Belmont Mining Company,

Another leading mine of ths district, only a few facts were obtained, but sufficient, it is hoped, to show something of its great value, past, present and prospective. Its past history is well known to have heen an exceedingly prosperons one up to about one year ago, having yielded to that date, according to different estimates, from $900,000 to $1,300,000, the latter amonnt being believed as nearer the correct figures. Dnring the past year the work has been vigorously prosecuted in making further developments, having now reached the perpendicular depth of 530 feet. The east vein was cut at the depth of 430 feet and the west vein, supposed to be the celebrated High Bridge ledge, at the bottom of the shaft, whence levels are now being run, one from the cross-cut from shaft 60 feet on the east vein and another on the hack ledge, extending 100 feet. There is a stope of ore between the 200 and 300-foot levels 350 feet long by 150 feet deep and 6 feet thick, from which very high grade ore is now being extracted, thought to he the richest ever taken from the mine, and if any one will take the pains to calculate the cubical contents from the figures given above, it will be seen that the quantity is by no means inconsiderable, and as the ore is estimated to average somewhere from $150 to $250 per ton, with samples running as high as $600, the prospects for a good yield for some time to come ought to be looked upon, to say the least, as flattering.

The immense body of water encountered a year or so ago has oow been pretty thoroughly drained by means of their fine pumping machinery, consisting in part of two 10-inch Cornish pumps, costing, with setting up, it is said, about $25,000, and at present in splendid condition, giving entire satisfaction to the company.

From 35 to 40 miles sontheast of Belmont is the Tybo mining district, an unusually lively camp, made so particnlarly through the operations of one company.

The Tybo Consolidated,

Comprising the Two G, from which most of the ore is derived, the Bunker Hill and other olaims, has two furnaces in snccessful operation with daily capacity for 40 and 60 tons respectively and now prodncing about 175 tons of bullion per month, although not being worked up to their full capacity; the bullion running from $400 to $500 per ton.

The company's large 20-stamp mill will bs started up together with one of the White roasting furnaces, recently procured, ahout the 1st of December, for the purpose of working a large amonnt of low grade milling ore already on the dump, with much more within sight in different portions of the miue. It was not until very lately auy process was known here for its profitable reduction, until a quantity was tested in one of these furnaces at the Jefferson mill, where the ore was found to chloridize as high as 94 per cent. The ledge is well defined, average width 6 feet, in some places as much as 20 feet, and the wider the vein the richer the ore, just the reverse of the fact as observed in the Austin mines. It is denominatsd hy experts a "contact fissure" hetween the limestone and porphyry. As the lime is bounded hy the slnte aud the porphyry by the granite, these, in a broader sense, might be viewed as the walls of the ledge, particularly as what is called porphyry at certain points examined seemed to bs nothing more nor less than a metamorphoeed granite.

The Two G

Is a remarkable mine in view of the fact that the surface, so far, bas scarcely heen scratched, the greatest depth of main shaft only 230 feet, although, owing to the trend of the mountain as related to the conrse of the vein, a greater depth from surface has been reached in one direction. Six levels have been opened, the fifth and largest abont 700 feet, the ore bodies holding out well in all the winzss, drifts and stopes and improving in character with the developments. There is more thau enough of ore in sight to keep the mill and furnaces running for the next 12 months if sinking and drifting were stopped to-day. But these move forward like clock-work simultaneously with the working of the furnaces, which not only pay all running expenses as well as for progressing developments, bot leave a considerable margin for profits besides. At leaet two more furuaces will be found necessary and will be eréoted during the year.

Every facility for information was furnished by Mr. W. W. Bausman, in charge of the books, and by Mr. M. D. Howell, the snperintendent, and hy Mr. F. Nowell, the foreman, for a thorough examination of the entire undergronnd workings, to whom great credit is due for the perfect system, exhibited not only in all the interior developments hut also in regard to all the exterior arrangements, whether of mill, mine or furnace, as compared with some bungling end "dead work" occasionally encountered.

Work is progressing on the Bunker Hill, another mine of the company, from which some good ore has been worked. It is called a western extension and looked upon as promising.

The Virginia,

Adjoining the Two G on the east and on higher ground, has a linear extent of 1,500 feet wide, and has been opened by a shaft 80 feet deep; ore vein, two and one-half feet wide and taking out ore similar in character to that of the Tyho Consolidated, and at the same depth may show a vein fully as large and valuable. It is owned by Messrs. Dimick, O'Connel, Garrett and Josleyn, citizens of Tybo or vicinity, and is looked upon, prospectively at any rate, as of great value. There was another location made hers by Messrs. Garrett, Josleyn and others, which probably should have had precedence in the order of mention from priority of location, which exhibits on the surface, or at the depth of 65-foot shft, ore similar in all respects to the above mentioned.

The Thunderstorm,

Owned by Mr. Rosenthal and others, one-half mile helow the mill of the Tyho Consolidated, is said to have been pronounced by the State geologist, and at least one distinguished professor, as a true fissure vein. It is very conveniently located for advantageous working, as it crops out at a considerable elevation on the mountain side, requiring hut n very short tunnel to tap the ledge at a great depth. Published nssays have appeared, running from $35 as high as $2,500.

An account of the numerous extensions on what is viewed as the main lode of the district, together with some notes from outside districts not visited, are necessarily omitted owing to the already too protracted length of the present communication, so that it will be drawn to a close by a brief mention of a claim known as

The Independence,

A consolidation of two locations, on what is snpposed to be a parallel lode, and situated a thousand or more feet distant from the Two G hoisting works and on the sonth side of the main ledge, the property of Mr. Luse and others of Tybo. A shaft had bsen sunk 65 feet, showing a two and ons-half foot ledge, with about 18 inches of pay ore, mostly milling, with some black sulphurets of silver. Some ore was seen on the dump said to assay from $100 to $150, or even higher figures, with average samples given at $114, which is considersd favorable for the class of ore in this locality.

The mines of Eureka will probably he heard from next. A. C. K.

In the Mountains.

(Written for the PRESS.)

After providing ourselves with the necessaries for a long drive, we left our stopping place upon the South Yuba for a trip to Webber lake and other places of interest. For the first twelve miles we travelled over the graded toll road mentioned in a former letter, which is for the most part exceedingly well built and is kept in good order. This part of the road leads us over the monntains between the valley of the South Yuba and that of Canyon creek, upon which latter the dam of the North Bloomfield gravel mining company is situated. This dam—(known as Bowman's dam, from the original owner of the ranch which now forms the lake)—is very strongly built across a narrow pass through whioh the creek runs, and the lake formed by it covers an extent of abont 1,000 acres. This dam is now heing raised and strengthened, and when finished will give thirty feet more depth of water and a probable area to the lake of about 1,200 or 1,500 acres. A flume leads from this dam along the mountain side, and carries water to the mines of the company. The establishment of the company at this point is a good illustration of moontain hospitality in its hest forms. The traveller is always welcome, and nobody ever need pass the station hungry, hut it is against their rules ever to receive payment for what one may eat.

Soon after leaving Bowman's dam we strike the

Old Henness Pass Road,

Famous before the advent of the railroad as the great road to Virginia City. Little now remains to show tbe immense amount of traffic which formerly passed over this road, except the ruined wayside houses which are scattered along at intervals of two or three miles.

The road, althongh neglected, is in a pretty fair condition for a mountain road, and hns many points of interest. Throngh this pass the late Mr. Judah, formerly engineer of the C. P. R. R., made surveys and reported favorably upon this route for the railroad. It is stated, on good authority, that if the road had been built here the grade from Alta to the summit need not to have exceeded 70 feet to the mile, and from the summit to Truckee it might have been made not to exceed 25 feet, while the difficulties of construction and maintenance would have been considerahly reduced.

Rain commenced falling just before our noon camp, and we made the remaining fifteen miles with alternate rain and sunshine. At Jackson's ranch, one of the former stopping placee, the hotel and most of the other buildings have been crushed hy the snow, and all is now desolate, where, in former times, as many as seventy-five large teams, with a proportionate amount of other travellers, could be seen stopping for the night. This place, for which $30,000 were refnsed at that time, could now be bonght for a few hnndred.

Webber Lake.

Towards night we arrived at "Webber's," glad enoogh to rest from our rough ride, and ready to do justice to the supper awaiting us.

Webber lake is a beautiful sheet of water, nearly round aud about a mile in diameter. It is situated a short distance beyond Henness

Continued on Page 238.

MECHANICAL PROGRESS.

The Care of Machinery no Mystery.

The *Mill Stone*, a monthly journal published at Indianapolis, Ind., one of the many good papers printed in the interest of special trades at the West, gives to its readers the following sound advice on the watchful care necessary in operating machinery:

To correctly plan and devise improvements in machinery involves the exercise of a considerable degree of original genius; and to fully develop such improvements, and to bring them into the most practical shape, requires, in addition to this, the application of acquired knowledge of the construction of the machine or mechanical combination, in such manner that each of the different parts thereof may be properly proportioned and arranged with reference to the particular function which it is designed to fulfill. When this is done, and the work completed, its useful mission has commenced, and inventive talent or skillful instructors need not be employed upon it, unless it should be to modify or add further improvements. Yet, however complete in itself, or however effectually it may perform its work, it is not endowed with the faculty of self-preservation, and, unless it be properly cared for, will be subject to numberless accidents and injuries, involving not only its own immediate or ultimate destruction, but, in many instances, the loss of life or limb to those employed in its operation. This necessary care requires, not the expert mechanic or professional skill, but simply the exercise of common sense. It is by prompt attention to the little things that the maximum efficiency and durability is attained, with properly designed and constructed machinery. When the bearings of shafts and the spindles are not oiled sufficiently, not only does the increased friction require a greater amount of driving power, but the bearings are roughened or destroyed in a proportionate degree. When the caps of journal boxes are left too loose, the journal wabbles, and, if there is gearing attached to the shaft, its teeth are badly worn out of shape; while, if the caps are screwed down too tight, the oil is forced out, the journal heats, and both the shaft and bearing are soon rendered worthless. These matters are of no small moment, and the aggregate loss resulting from inattention to them is very great. It is not confined alone to the machinery of mills and other manufacturing operations, but occurs in a very much greater degree in machinery employed in agriculture. Many a thresher, horse-power, or harvester has been branded of bad construction, and been prematurely disabled, when a few drops of oil, or one or two turns of the wrench, were all that were required to set things to rights. Many other items might be mentioned, in which attention to little details, requiring only an application of ordinary common sense, will guard against great and unnecessary waste of power and damage to machinery; but these are sufficient to illustrate the almost self-evident proposition that, while talent is required to originate, and practical knowledge to construct machinery, its most efficient operation, and the profit in its use resulting therefrom, can only be secured by bringing to bear upon its management the plain, ordinary principles derived from every day observation and experience.

WAVE POWER.—Additional experiments made in England with Mr. Tower's machine for obtaining motive power from the motion of a ship among waves, says the *Iron Age*, have attracted renewed interest in the invention, and also in the general scientific question which it undertakes to solve. The machine has at least the merit of simplicity, consisting in principle of a weight supported on a spring so that it can oscillate on the spring through a considerable range in a vertical line. The scale of the spring, and, consequently, the natural period of oscillation of the weight, can be varied at will. When it is so adjusted that it synchronizes with the waves, the oscillations become very violent, and a large amount of power can be obtained from them. In practice the springs consist of highly compressed air, pressing on the rims of hydro-pneumatic cylinders, and the arrangement is such that the vessel containing the compressed air forms the moving weight. The inventor has designed a machine for working an auxiliary propeller of a sailing ship of 1,800 tons displacement. The moving weight in this case is 200 tons, and it is shown by calculation that it would give about 30 horse power in the long swell met with in the tropical calms, 260 horse-power in the average ocean waves, and more than 600 horse-power in a heavy head sea. The space occupied by the machine is represented as comparing favorably with a steam engine of the same power.

PNEUMATIC RAILWAY.—A pneumatic railway, for the dispatch of messages between Paris and Versailles, just completed, is nearly 13½ miles in length. The tubes, made of brass, are three and a-half inches in diameter, and two-fifths of an inch thick. They are laid at a depth of eight feet from the surface, on a flooring of wood, and are pitched both inside and out.

SHIP SAFE.—A proposed safe for vessels is a buoy with proper compartments for bullion, jewels, etc., and not liable to be sunk or lost for years, as has frequently been the case with ordinary bullion safes when the vessels carrying them have been lost. The idea has been patented by J. L. Goutey, of New Orleans.

LIQUID INDICATOR.—Dr. Simens has designed an instrument by which a stream of alcohol and water mixed in any proportion is measured in such a manner that one train of counter wheels records the volume of mixed liquid, while a second counter gives a true record of the amount of alcohol contained in it. The principle on which this measuring apparatus acts may be shortly described thus: The volume of liquid is passed through a revolving drum, divided into three compartments by radial divisions, and not dissimilar in appearance to an ordinary wet gas meter; the revolutions of this drum produce a record of the total volume of passing liquid. The liquid, on its way to the measuring drum, passes through a receiver containing a float of thin metal filled with proof spirit, which float is partially supported by means of a carefully adjusted spring, and its position determines that of a lever, the angular position of which causes the alcohol counter to rotate more or less for every revolution of the measuring drum. Thus, if water only passes through the apparatus, the lever in question stands at its lowest position, when the rotation motion of the drum will not be communicated to the alcohol counter; but in proportion as the lever ascends, a greater proportion of the motion of the drum will be communicated to the alcohol counter, and this motion is rendered strictly proportionate to the alcohol contained in the liquid, allowance being made in the instrument for the change of volume due to chemical affinity between the two liquids. Several thousand instruments of this description are employed by the Russian government in controlling the production of spirits in that empire, whereby a large staff of officials is saved, and a perfectly just and technically unobjectionable method is established for levying the excise dues.—*Nature.*

METALLIC RAILWAY CARS.—The building of metallic railroad cars has been in course of experiment for some time. Steel freight cars are suggested, as they are far less in weight than those constructed of wood, thus saving wear and tear of the trucks. It is claimed that a steel car can be made weighing no more than seven tons, that will carry twice that weight of freight. If the tracks are of steel, a car of 10 tons weight can be made that will carry 25 tons of freight. The construction of these vehicles is also stronger and more durable than the wooden cars. Already many iron cars are in use, and freight cars of sheet iron have been made at Pittsburg, and the belief is expressed that the new style of freight car can be successfully constructed. But before it can be generally introduced its cheapness in the long run must be made apparent, as that is the element which, after all, will decide whether cars are to be made of wood, iron, or steel. At present wood is much the cheaper and most easily worked material, and it will continue to be used until iron or steel can underbid it either in actual first cost or else in the demonstration of a much greater durability that will compensate for increased original expense.—*Philadelphia Ledger.*

MONSTER MACHINES.—The growth of the guns has necessitated a corresponding increase in the size and power of the machinery by which they are produced, and nearly all the plant of the Royal gun factories is about to undergo a transformation. *Iron* says: "Two very remarkable lathes are being made in the Dial square with the view of being prepared to turn out rapidly a succession of 80-ton guns, and if requisite to set to work upon monsters yet more tremendous. These lathes are to be nearly 80 feet long, and fitted with double saddles and quadruple gearing, and they will be capable of slicing off iron shavings eight inches broad, and thick in proportion, at a cut. A remarkable crane has been planned and is about to be erected in rear of the Royal gun factories, Woolwich. It may be described as a circular traveler. On a strong pedestal about 30 feet high, two arms or branches will radiate horizontally like the hands of a watch, the extremities of which will rest upon a circular platform supported by columns. The branches will be moved by steam power all around the compass, pivoting on the center, and it is estimated that with sufficient tackle they will lift 1,000 tons."

AN IMPROVEMENT NEEDED IN SLEEPING CARS. A writer to the *Railroad Gazette* says: "The recent accident on the St. Louis, Kansas City & Northern railway, at which the treasurer of that road and some other passengers lost their lives by reason of the 'shutting up' upon them of the upper berth in which they were sleeping, should induce the Pullman Palace car company to take at once the necessary steps, by some efficient appliance, to prevent the possibility of such a horrid fate to any passenger. Surely some simple means can be devised to insure the rigidity of the berths, even after the spring gets loose, at some point where the passenger can get out; and every one of the hundreds of the Pullman coaches should have the upper berths secured in that manner without a moment's delay."

LEASING FARM MACHINERY.—A company has been formed in England who propose to furnish machinery to farmers, manufacturers and others, on a purchase-hire system similar to the practice of sewing machine and piano manufacturers in this country, of periodical payments extending over a term of one, two and three years. The English company has a capital of $5,000, divided into shares of $50, and was lately registered as a legally organized corporation.

SCIENTIFIC PROGRESS.

A Chance for Applied Science.

The address at the opening of the British Science Association was made by the President, Dr. Andrews, and was very able. Among many other things he said: In the application of science to the useful purposes of life, chemistry and mechanics have run an honorable race. It was in the valley of the Clyde that the chief industry of this country received, within the memory of many here present, an extraordinary impulse from the application by Neilson of the hot-blast to the smelting of iron. The Bessemer steel process and the regenerative furnace of Siemens are later applications of high scientific principles to the same industry. But there is ample work yet to be done. The fuel consumed in the manufacture of iron, as, indeed, in every furnace where coal is used, is greatly in excess of what theory indicates; and the clouds of smoke which darken the atmosphere of our manufacturing towns, and even of whole districts of country, are a clear indication of the waste, but only a small portion of the waste, arising from imperfect combustion. The depressing effect of this atmosphere upon the working population can scarcely be overrated. Their pale, I had almost said etiolated, faces are a sure indication of the absence of the vivifying influence of the solar rays, so essential to the maintenance of vigorous health. The chemist can furnish a simple test of this state of the atmosphere in the absence of ozone, the active form of oxygen, from the air of our large towns. At some future day the efforts of science to isolate, by a cheap and available process, the oxygen of the air for industrial purposes may be rewarded with success. The effect of such a discovery would be to reduce the consumption of fuel to a fractional part of its present amount; and although the carbonic acid would remain, the smoke and carbonic oxide would disappear. But an abundant supply of pure oxygen is not now within our reach; and in the meantime may I venture to suggest that in many localities the waste products of the furnace might be carried off to a distance from the busy human hive by a few horizontal flues of large dimensions, terminating in lofty chimneys on a hillside or distant plain. A system of this kind has long been employed in the mercurial mines of Idria, and in other smelting works where noxious vapors are disengaged. With a little care in the arrangements, the smoke would be wholly deposited, as flue-dust or soot, in the horizontal galleries, and would be available for the use of the agriculturist.

PHYSIOLOGICAL EFFECT ON CONDENSED AIR.—The *Engineer* says: M. Bert, of Milan, has for a long time been conducting a series of experiments with a view of determining what are the physiological effects of condensed air on the human system. Many engineering works of the day involve the necessity of workmen carrying on their operations under various pressures of air, to say nothing of the fact that the rise and fall of the barometer involve us all in changes differing only in degree from that which the diver experiences when he descends from the surface of the water to a depth of fifteen or twenty fathoms beneath it. M. Bert thinks that the influences of ordinary changes of air as indicated by the barometer are due exclusively to the varying quantities of oxygen contained in the air inhaled. The pressure of oxygen and the consequent amount of it which finds its way into the blood, he shows, depends upon the centesimal proportion of it in the air and upon the barometrical pressure; and he says that the mischief which operatives in air-tight dresses so often experience from the density of the air they are compelled to breathe, might be completely obviated if an atmosphere were composed of air and nitrogen nicely adjusted in proportion to the pressure under which the mixture was passed along the tubes. Although it has been stated on good authority that a man may follow avocations involving the breathing of condensed air in certain cases not only without injury but even with advantage, there are also many cases in which injury is believed to result, and M. Bert's experiments may prove to be of great benefit to them.

LIGHTNING RODS.—Dr. Mann read a paper at the science conference at South Kensington, whose purpose was to show how unimportant is the form of lightning conductors, whether rods, ropes or pipes; and that the real desideratum is that they shall be of sufficient size to afford an unobstructed path for the passage of the electric fluid. He insisted on the necessity of a goodly number of points, and above all upon the indispensability of large earth contact, saying that a lightning discharge passing through a large rod with an ample earth contact is only a gentle stream of low tension; but that, if the size of the rod or the area of its contact with the earth is diminished, the tension is increased, and the fluid has a dangerous tendency to discharge itself laterally by chance outlets.—*Journal of Telegraph.*

SCIENCE TEACHING IN ABERDEEN.—The citizens of Aberdeen are about to form an association to establish a school of chemistry and agriculture, in which botany and physiology will also be taught. Chemistry has hitherto been taught in the Mechanics' Institution in the city, but the school there has not sufficient accommodation, nor the proper appliances for the modern laboratory.

Notes on Blowpipe Analysis.

H. B. Cornwall writes: In a note published in the *American Chemist*, March, 1872, I stated that Van Kobell's iodide of potassium and sulphur test for bismuth gave also a marked reaction with lead compounds. The characteristic yellow sublimate which it affords with lead compounds is nearly as volatile as the real sublimate obtained by it with bismuth compounds, both of them being formed at a greater distance from the assay than the simple yellow coatings of oxidee of lead and bismuth which frequently accompany them. The iodide of potassium and sulphur mixture constitutes a simple and very delicate test for lead, even in presence of a very large amount of bismuth, as experiments will show, and I direct the students to rely chiefly upon it, remembering only that the iodide of lead (?) sublimate is much more volatile than the simple yellow coating of oxide of bismuth or lead, which always lies near the assay. A few precautions are necessary in using the mixture as a test for lead, and also for bismuth to a certain extent.

Mercury compounds will often afford a yellow, sometimes a reddish sublimate with the mixture; sulphide of arsenic in large quantities, a yellow sublimate; sulphide of antimony, an orange, sometimes a reddish sublimate; cadmium compounds the yellowish brown coating of cadmium oxide, which might mislead beginners. All of these can be removed by a preliminary treatment with a moderate oxidizing flame, to such an extent as not to interfere with the lead or bismuth reaction, and they should be so removed when present in large quantities. Finally, some tin compounds yield a yellowish sublimate with the iodide mixture, but it is very near the assay, and quickly becomes white on continuing the blast. These facts have partly been brought to my notice during practice with classes, and therefore will be of interest mainly to beginners, who are most liable to be deceived by the reactions given. The mixture is, however, highly to be recommended in testing for lead, having given indications of that metal in bronze and cadmiferous calamine, when all other blowpipe tests failed; the lead in the bronze was overlooked by an experienced chemist.

Experiments with Preserving Wood.

The *Polytechnic Review* makes a summary of some valuable experiments which have been made with preserving wood with different mineral solutions. The tests were made with railway sleepers. Of pine sleepers impregnated with chloride of zinc, after 21 years of service, the proportion that had been renewed was 31 per cent.; of beech sleepers impregnated with creosote, after 22 years, 46 per cent. had been renewed; of oak sleepers, not impregnated, after 17 years, 49 per cent. had been renewed; of oak sleepers treated with chloride of zinc, at the expiration of 17 years, 20.7 per cent. had been renewed. In all of these cases, the conditions to which the wood had been exposed were very favorable—the road-bed being a very good one, and permitting of excellent drainage.

Test samples taken from sleepers that were allowed to remain at the expiration of the respective periods named, exhibited a perfectly sound cross-section.

The following statement contains the results of a similar set of observations made upon the Kaiser-Ferdinands Nord R. R., viz:

According to these observations, the proportion of renewals was, with oak sleepers (not treated) after 12 years' service, 74.48 per cent.; with oak sleepers, treated with chloride of zinc after seven years, 3.29 per cent.; with oak sleepers, impregnated with creosote oil, after six years, 0.09 per cent.; with pine sleepers, impregnated with chloride of zinc, after seven years of service, 4.46 per cent.

The practice of the Kaiser-Ferdinands-Nord R. R., since the year 1870, has been to employ only oak for sleepers, which are impregnated either with chloride of zinc or with creosote oil.

ON THE GEOLOGICAL AGE OF VEINS OF MERCURY.—Attention has been called, says *Iron*, to the fact of native mercury presenting itself, in various parts of France—the Cevennes, Heranlt and Aveyron—in places but little below the surface of the soil, betraying its presence by its effect on vegetation, and through that on animal life. Virlet d'Aonst recalls the fact that the Abbe Sauvage pointed out the existence of the same metal in the most recent tertiary formations in the neighbourhood of Montpellier, and that Daniel Sharpe mentioned a Portuguese mercury mine, worked at the end of last century, which was situated in the upper tertiary sands. At Guadaloczar (San Luis Potosi) the author of this note has seen cinnabar extracted from the calcareous formations of the chalk period, which the mercury had penetrated; as, however, mercury is frequently met with in the argentiferous veins of the country, it may be concluded that it is of their age. In Spain, whilst the famous mercury mines of Almaden, in Andalusia, are situated in silurian strata, those of Mieres, in the Asturias, lie in the coal strata. In the latter locality the mercurial emanations have penetrated to the alluvial strata, probably old, which rest upon the coal formations, and have impregnated them over considerable surfaces; they form patches in the soil which might serve as indications of the generating veins.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the mines mentioned.

California.

ALPINE.

I X L MILL.—Alpine *Chronicle*, Sept 24: Within tbe next two weeks 70 tons of machinery will be shtpped from the Vulcan iron works, San Francisco, for this mill, 35 tons having been shipped last Monday. A large force of mechanics from San Francisco will be on the ground on Monday next; quite a large amount of timber is on the ground, and grading will be finished on Saturday next.

MORNING STAR.—Last week United States Deputy Mineral Surveyor Erich G. Gaertner surveyed thie mina for a U. S. patent.

OCCIDENT.—This mine was this week surveyed by U. S. Surveyor Gaertner for the purpose of applying for a U. S. patent.

MOUNTAIN.—This week tbis mine was surveyed by Mr. Gaertner for the purpose of reporting to the Directors and stockholders.

STRAIGHTENING.—The curve of tba road at the I X L mill site is being straightened—a much needed improvement.

LADY FRANKLIN.—A contract has been awarded by tbis company to H. C. Ginn for the furnishing of timbers, lagging and cordwood.

AMADOR.

MINING AT AQUEDUCT CITY.—*Dispatch*, Sept. 3: We understand that a company of Italians are now working a gravel claim of 40 acres in Aqueduct City, about 10 miles above this place. They have their derricks and other machinery in full operation, and have already worked down about 30 feet. The mine is said to have paid splendid wages from the top down as deep as they have gone. There are plenty more good mines in the same vicinity, if parties will only work them.

CALAVERAS.

GOOD CLEAN-UP.—Calaveras *Chronicle*, Sept. 30: We have cheering intelligence from the Josephine mine at West Point. A large quantity of rock from it has been put under the stamps since the completion of the mill lately erected in connection with the mine, and a clean-up was made a few days since. The quartz paid an average of $20 per ton—an encouraging yield for unassorted rock. Considerable ore still remains on the dumps, and work in the mine is actively progressing. Scarcity of water for milling purposes retards operations somewhat, a difficulty that the first rains will obviate. The outlook for the Josephine is flattering.

MILL STARTED.—The mill at the Lamphear mine was put in motion last Saturday, and has been running day and night ever since. The machinery works splendidly, and the rattle of the stamps sounds like business. That's the music to which dull times marches out of camp. The battery is crushing rock from the Lamphear and Quaker City mines.

LAMPHEAR MINE.—Work continues energetically at the Lamphear mine. Sinking tbe shaft is progressing rapidly, and the 100-ft north level is also being extended. Good rock is found in both places and the development are altogether favorable.

GOOD YIELD.—Crushing of 40 tons of ore from the mine of Fields & Co., at West Point, paid an average of $21 per ton. The mine has proved very remunerative from the outset and shows no signs of "letting up."

EL DORADO.

A BONANZA.—El Dorado *Republican*, Sept. 30: The St. Lawrence is rapidly developing into a bonanza indeed. Since our report of last week a ledge four feet and a half wide has been discovered in the cross-drift at the 300-ft level, about 80 feet from the main shaft, in a position to be easily worked, and as far as tested is shown to be very fine ore. The parties who previously worked the mine came within two or three feet of making the same discovery, and if they had the works would not, probably, have been closed down to this day. It now seems evident that the main ledge was lost at or near the 500-ft level, and that the small ledge they were following, though rich, would not pay for so expensive a manner of working, though on a smaller scale would have paid handsomely. The present company are exceedingly fortunate in being able to reap the benefits so nearly within the grasp of their predecessors. Upon the fact of this find being made known hotders of stock felt that they were in the biggest kind of luck, while those who had neglected to purchase were quite chagrined, as the stock at once went up 400 to 500 per cent. There can now be no possible doubt about the St. Lawrence being one of the best, if not the best, mine in the State.

NORTH SMA MINES.—*Mountain Democrat*, Sept. 30: "E. L. C." writes us as follows concerning mining operations and interests in the vicinity of Georgetown: The Rosekrans mine is getting fine prospects and have a ledge some three feet in width, with gold well distributed through it. The Taylor mining company are sinking their shaft. Last week they made about six feet. the rock is very hard. They expect to strike the ledge in about 20 feet, when they will get along much faster. The Volcano quartz company (Graves Bros. & Co.) had 17 tons of rock crushed at the Woodside mill last week, which yielded the nice sum of $3,200, nearly $200 per ton. They now have about 100 tons, which they estimate will yield $75 per ton, and having visited the mine and examined the rock I do not think this an over-estimate. They have a cut sluiced in on the ledge about 25 feet, and one can find gold all along the ledge, which is from 15 inches to three feet wide. The shaft is down about 50 feet and the ledge shows gold all the way. Taken all in all, it is one of the best prospects ever found in this section. They contemplate erecting a ten-stamp mill. Having a good water right, they will be able to get all the power they want at a very small expense.

A GRAND STRIKE.—After we had gone to press last week we received notice that an extensive and marvellously rich body of quartz had been developed in the lower level of the St. Lawrence mine. At the 800-ft level, about 80 feet from the shaft, a cross-drift into the foot wall developed a four-and-a-half-foot ledge of richer ore than has ever been seen in that mine. As the St. Lawrence has always been considered the keystone, as it were, of the quartz interest in this county, the news of this development was hardly less gratifying to the general public than the lucky stockholders in the St. Lawrence.

INYO.

MILLS FOR LOOKOUT.—Inyo *Independent*, Sept. 23: We hear that R. C. Jacobs is preparing to remove his five-stamp mill from the Sunrise mine, Panamint, to Lookout district; also that the Minnealta Belle company are getting in a small mill. This mine is said to be turning out grandly.

LAKE.

A TRIUMPH OF SKILL.—Lake *Democrat*, Sept. 23: The Sulphur Banks mine, in this county, is well known as one of the best paying mines in California, and the men who have control of it have thus far shown an ability in its management that has not only proven their skill as quicksilver miners, but developed a source of revenue that Lake county is justly proud of. Furnace after furnace has been erected there, and experiments are being made daily and successfully with the view to further develop the resources of the inexhaustible store of quicksilver and sulphur that lies buried at the extremity of the eastern arm of Clear lake. But of all the work being done there, no portion of it deserves so much notice or holds the attention of the visitor so closely and interestingly as the concentration works of Messrs. Adams & Carter. These works are distinctly separate from the mine, Messrs. Adams & Carter receiving the ore from the company and concentrating it for the company's reports, at so much per ton. The works have been built by the above named gentlemen at an outlay of $26,000. Two steam engines are required to drive the requisite machinery, and 16 Chinamen and eight white men form the working force that keeps the work moving night and day. The ore is fed into vats and ground into powder so fine that some of it floats off in a foam-like jelly. The pulverized ore, finally, after being submitted to a process that almost puts one in mind of a flour mill, is fed slowly on to endless rubber aprons, which revolve against a hundred or more tiny jets of water, the jets driving the sand and dirt down the apron, which is moving imperceptibly towards the jets and carrying the heavy powdered cinnabar in an opposite direction from which the water is washing off the dirt. The cinnabar sticks to the apron until it is washed off underneath; a stream of cinnabar going one way and one of dirt flowing the other, a complete separation taking place on the rubber apron. The cinnabar is then taken in charge by Alonzo Brandt, foreman of the sulphur works and the retorts, and from these retorts the yield of quicksilver is simply enormous.

MARIPOSA.

THE SCANLON MINE.—Mariposa *Gazette*, Sept. 23: This mine is one that has the most flattering prospects of any in the county. The vein can be traced on the surface for a distance of 3,000 feet, and throughout this distance shows a width of from three to ten feet of ribbing rock, the most favorable known to miners. The course of the vein is east and west. The mine lays in a most favorable position for getting the ore to the mill, and in addition to this, has one of the best water privileges in the State. From a lot of 21 tons of ore, we are informed that Mr. Tripp took 60 ounces of amalgam. This is a pretty good showing, and we hope soon to be able to place it on the list of dividend paying mines.

NEVADA.

HOMEWARD BOUND MINE.—Grass Valley *Union*, Sept. 20: We have most excellent reports from the Homeward Bound, and they come from men who have recently been underground there, as well as those who are regularly employed in the mine. The ledge is in the neighborhood of three feet thick, and is showing well in mineral, the gold being visible in much of the rock. It is the opinion of the experienced miners, who have worked for years down among the Wolf creek mines, that the Homeward Bound is giving now a splendid showing for future success. And there are plenty of other ledges in the district that can be turned into mines by having good work done upon them.

CHANGE OF SUPERINTENDENCY. — Mr. Robert M. Fryer, on account of impaired health, has resigned the superintendency of the works of the Fryer Noble Metal mining company, near this place. Mr. Fryer needs rest and recuperation, hence the resignation. Mr. Chas. E. Sherman, who is one of the most experienced metallurgists on the coast, is now superintendent of the works, and will transact all the business in connection with the same.

STRUCK IT RICH.—A prospector, who has for some time been engaged in relocating an old abandoned claim between the New York Hill mine and the North Star schoolhouse, struck a ledge last Monday of such richness that up to last evening the specimen quartz yielded $1,509.75, or an average of nearly $300 per day. He thinks he is "making wages," but is quietly prospecting his prospect.

LONE JACK.—*Foothill Tidings*, Sept. 30: Parties are working "on tribute" near the Homeward Bound mine on Lone Jack ground.

THE Yuba mill is going up with rapidity. The Ingersoll drill will be at work in a few days and the mine in all its parts is looking well.

Goon reports continue to come from the Homeward Bound mine. The ledge is strong and looks well, and all interested seem sure of a splendid mina when properly opened.

PLACER.

MINING ITEMS.—Dutch Flat *Forum*, Sept. 29: The various claims in this vicinity are being fitted up in readiness for the approaching season. Foremost among them is the Baker claim, on which work is being driven with all possible speed. The Baker shaft is about completed; it was sunk 12 feet last week. The Yankee tunnel was driven ahead 40 feet last week. Only a short distance remains to connect with the Baker shaft. The Cedar Creek company is engaged in sluicing out their supply reservoir situated just above town. It had become so filled with sediment that tha above work became a necessity. The South Yuba canal company are hard at work cleaning out their ditches, repairing flumes, building reservoirs, and generally preparing for the approaching winter.

TAILINGS.—Col. Ludlum, of this place, and Mr. Gould, of Gold Run, have just returned from San Francisco, where they have been representing this section of the county in the Association of Hydraulic Miners, and have been elected members of the Board of Directors. They report that the debris suits are in safe hands and will be faithfully attended to, and that the principle involved is one affecting our entire mining interest, nearly all the hydraulic mining companies in the State have joined in the defence.

SLATE QUARRY.—We are informed that some parties are engaged in prospecting a vein of slate, located about five miles below Emigrant Gap. The vein is a large one, and the owners are satisfied that they have a good thing. They have sunk several holes by the side of the ledge, and find it to be a good article, splitting into thin sheets, smooth and even, some of them six feet wide by eight feet in length. One of the proprietors, a gentleman who has had considerable experience in this line, pronounces it the best slate he has ever seen. The ledge is owned by parties in Penryn and San Francisco. We hope that the owners will use every endeavor to have it developed and put in good running order.

FOR some time past the San Francisco *Chronicle* and Nevada *Transcript* have been publishing articles in relation to the sale of the South Yuba ditch, it being asserted that Alvinza Hayward, the proprietor, was trying to dispose of the ditches and water rights to the city of San Francisco. We are informed by a reliable party that there is no truth in the statement; that the property is not for sale. The South Yuba ditch was bought by Mr. Hayward to furnish a continuous supply of water to his claims in Dutch Flat, and not for the purpose of speculation, asserted by the *Chronicle* and *Transcript*. The sale of the property to the city of San Francisco would result in great injury to the different mines in and about Dutch Flat, who depend upon the South Yuba ditch for their supply of water.

PLUMAS.

MINING ITEMS.—Plumas *National*, Sept. 29: The Bald Mountain company, of Forest City, of which Mr. G. G. Clough is President, will soon put in a steam engine to haul the gravel care to the dump-sheds, the first enterprise of the kind on the coast. The Bald Mountain is probably the most extensive tunnel claim in the State, and the dirt is wonderfully rich. The Gold Stripe mine, on Wolf creek, is paying big—$5,000 or $6,000 a month. The workmen in the Bell company's tunnel have crossed a large vein of quartz this week, which prospects splendidly, and the managers are highly elated with the prospects of the mine. A new town has been laid off up at the Wolf Creek mine, and promises to be a lively place. Mr. Jos. Halsted, of the East Branch company, was in town on Wednesday, and reports everything favorable and prospects first rate at the mine.

SANTA CRUZ.

NEW COMPANY.—Santa Cruz *Courier*, Sept. 28: Articles of incorporation of the new mining company were signed and filed yesterday in the County Clerk's office. The trustees of the company are: W. N. Cummings, George Treat, Amasa Pray, Sr., W. D. Storey and S. T Jones. The capital stock is $300,000, divided into 30,000 shares of $10 each. Their mine is located at the upper end of Gold gulch, six miles north of Santa Cruz. The value of this rock was shown by a statement of a prominent San Francisco assayer in the *Courier* last week. It contains $39.78 gold and silver per ton. It is the purpose of the company to begin work immediately on their mine.

TRINITY.

FROM CINNABAR.—*Journal*, Sept. 30: Mr. Lawrence, in charge at the Altoona quicksilver mine, was in town this week. From him we learn that the brick necessary for the erection of two furnaces have been molded, and that the furnaces will be erected early next spring. Four hundred flasks of quicksilver have been produced at the Altoona this month.

TUOLUMNE.

GRAVEL.—Tuolumne *Independent*, Sept. 30: The Remington gravel claim, near Yankee Hill, looks encouraging. They have just cut through into the gravel, and is cleaning up to put in a couple of boxes got a good prospect. The flume will get into the pay dirt about 102 feet from the surface, but this is not expected to reach the bottom of the deposit, which prospects satisfactorily. The only question is as to the extent of the gravel bed in width, to establish it as a lasting claim. Whether this particular claim may prove as extensive as desired is, perhaps, yet to be tested; but we are perfectly satisfied that deep gravel claims, extensive and numerous, will be opened in that section of the county at an early day, and the success of this pioneer enterprise is most earnestly hoped for by every one who is looking for the good time coming.

AT the Riverside mine, in American Camp district, they are still pushing on their tunnel, which is now in about 300 feet, and the indications are that they will strike a shute this week. They are running on the vein all the way. The present tunnel runs in from the river, and will meet a point on the vein over 2,000 feet in depth from the surface. The vein is from five to seven feet in width. They have a fine mill of 20 stamps, which is run by free water. As soon as they get to a shute, more force will be put on to get out rock and start up the mill, while the tunnel will still go piercing the mountain. The advantage of draining the mine at a depth of 2,000 feet is a great feature, and saves an expense of thousands of dollars in pumping, besides the great economy in getting out ore by means of the tunnel.

THE five stamp mill now being erected on the Jones & Woodman mine is designed more especially as an aid to thoroughly prospect and test this vein as well as others they own. As we have said before, the mine is rich and extensive enough to justify a mill of 10 times this number of stamps, but the owners very wisely, we think, prefer to feel their way and not swamp their property, as too many have done in the past, by putting up machinery beyond their present means of payment. Slow and sure is better than going so fast that others may come in and take the cream. An assay of sulphurets was made last week from rock selected as showing no trace of free gold, with a result of $666 per ton. Some of their ore assays into the thousands.

MR. ROBERT SLOAN crushed 15 tons of rock from his mine in the American Camp district, last week, at the Riverside mill, which paid him at the rate of $60.

Nevada.

JERSEY DISTRICT.

SLUICING ORE.—*Silver State*, Sept. 25: S. J. Chambers informs us that J. B. Meder, lessee of the Jersey mine, has a new whim almost completed at the shaft. He has also built sluices at the Hot Springs, about a mile from the mine, for the purpose of concentrating the second-class ore. This new arrangement works admirably and the argentiferous galena, separated from the barren rock, is more than sufficient to pay all the expensee of running the mine.

BOB SCHMITT, owner of the Virginia mine, situated about two miles from the Jersey, has commenced work on the same, and at a depth of four feet from the surface has a vein six feet wide. The ore is argentiferous galena, like that of the Jersey, which it resembles in every particular. The district never looked more prosperous than at present, and there is no doubt of the richness and permanency of the mines.

SAN JACINTO DISTRICT.

ANTELOPE.—*Silver State*, Sept. 25: R. M. Howland, Superintendent of the Antelope mine, in San Jacinto, was in town last Saturday. He informed us that he is now drifting with all possible speed to the ledge, and that they expect to strike it big in a few weeks.

RAILROAD DISTRICT.

PROGRESSING.—Eureka *Sentinel*, Sept. 24: From Louis Loschenkohl, who lately paid a visit to Railroad district, we learn that everything in that section is progressing satisfactorily. The new ten-stamp mill is in successful operation and the mines are looking and yielding well. The mill is in charge of Professor Knisell, one of the oldest and most competent manipulators of ores on this coast. He has faith that he will yet be able to treat the ores of Railroad district without the aid of a roaster. The district seems to be on the high road to prosperity and its prospects are daily brightening.

SECRET CANYON DISTRICT.

NOT MUCH DOING.—Eureka *Sentinel*, Sept. 30: There is at present but little being done in the mines of Secret Canyon. It is believed that operations on a comprehensive scale will be resumed in the Geddes & Bertrand as soon as negotiations for the transfer of the control of the property to Gashwiler & Co. shall have been consummated.

TUSCARORA DISTRICT.

RICH ORE.—*Silver State*, Sept. 28: J. Arrowroot, of San Francisco, one of the big mining men of that city, passed here yesterday on his return from Tuscarora. He says that the Grand Prize mine in that district contains the richest ore he ever saw near the surface of the ground, and he is of the opinion that the district is one of the best in the State.

STAR DISTRICT.

SHEBA MINE.—*Silver State*, Sept. 28: Wm. Woolcock, who left Star City yesterday morning, informs us that a streak of exceedingly rich ore has been struck in the lower works of the Sheba mine. This ore is being assorted for shipment to San Francisco.

ELY DISTRICT.

ALONG THE LINE.—Pioche *Record*, Sept. 24: Mining matters in Pioche have brightened up considerably during the past week, and the present indications presage a change for the better. In the Meadow Valley everything is booming along towards completion. Men are busy excavating for the pumping machinery, which will, in all probability, be shipped from San Francisco this week. Everything around the mine presents an active appearance, and when the machinery is in place and in operation, it is pretty certain that this old favorite will give a good account of itself. A chloriding party, who have been prospecting in the Deedmons, report a daily extraction of six tons, with plenty more of the same kind in sight. The Huhn & Hunt mine has been bonded in the sum of $50,000 to Chicago parties, who, it is believed, will consummate the bargain and commence active operations in a few weeks. The general report from the other mines is "about the same." The Alpe mill starts up this morning, and the Newark mill starts up to-morrow morning.

MEADOW VALLEY.—Yesterday the Meadow Valley mine was again shut down, this time good and strong. What for is not known. What the little game of the trustees is is also kept well in the background. That they are playing a game of some sort is evident. They induced miners and workmen to accept an unheard of, one-sided proposition—all on the side of the company—and even from that they have seen fit to withdraw. If the mine starts up again within six months it is more than any one expects. The machinery that was to have been shipped on or about the first of October, we are now informed, will arrive sometime in December. It is a fact well known that the Meadow Valley has a promising future before it, and it is no part of the purpose of the management to let the small fry in on it.

WARD DISTRICT.

A VISIT TO WARD.—White Pine *News*, Sept. 30: Like many others, we had a curiosity to see the new and flourishing town of Ward, and to satisfy that curiosity we made a flying visit there the latter part of last week, and were well repaid for so doing. We will not undertake a description of the location of the town or of the mines, for the reason that Gen. Cadwallader, in our last issue, exhausted those subjects, and we could only corroborate what he so truthfully wrote. However, we can say this, that as development is made upon the mines of that district, large bodies of rich ore are being discovered, not only by the Martin White company, but by other parties who are prospecting in that locality. The Martin White company were running one water-jacket furnace very successfully, and it was producing bullion that is valued at $400 to $600 per ton. The company have received an abundance of charcoal, and will start up their other furnace the first of the coming week. The company have a large force of men employed in grading for the new mill site and making roads. Most of the machinery for the new mill has arrived, and it will be set up at the earliest possible moment. Everything about the company's works looks like business, and suggests the idea that it is a permanent institution.

WASHOE DISTRICT.

CALIFONNIA.—Gold Hill *News*, Sept. 28: Daily yield 600 tons, from the ore breasts and stopes of the 1500, 1550 and 1600-ft levels, all of which continue looking and yielding as finely as could reasonably be wished. Three hundred tons of this ore is hoisted through the C. & C. shaft, and the balance through the Con. Virginia shaft. The east cross-cut from the main south drift at the 1600-ft level has been connected with the winze from cross-cut No. 5 from the level above. The main south drift at this same level has been extended 26 feet during the past week, and is now 122 feet south of cross-cut No. 5, the face still continuing in rich ore. The direction of this drift was changed yesterday to a course south 38 degrees east, in order to connect with the California deep winze. The C. & C. shaft is now down 125 feet below the 1500-ft station. Rock working fine and favorable.

JUSTICE.—Daily yield, 155 to 160 tons, from the 600-ft level and other ore producing levels above, with a few tons from the 800-ft level, extracted in running the main drift. The ore stopes and breasts are all looking and promising very well, with considerable improvement both in quality and quantity as farther opened and developed. The north portion of the mine shows the best. At the 800-ft level a fine body of good milling ore is developing at the north end, adding very materially to the resources of the mine. Cross-cuts Nos. 1, 2 and 3 east, at this level, are looking about the same as at last report. Work is resumed at the 1000-ft level south, and the drift is advancing at a good rate in soft vein matter. In the north drift and northeast crosscut, at the same level, work is temporarily suspended by reason of a heavy flow of water being tapped. This also has caused work to be temporarily suspended at the bottom of the main incline. The water is decreasing and will soon be drained so that work can be resumed again. Of course this strong flow of water does not affect the ore production of the mine in the least.

CON. VIRGINIA.—Daily yield 350 tons to 400 tons per day, from the 1400 and 1550-ft levels, keeping the Brunswick, Trench and Bacon mills steadily running. All the ore breasts and stopes are looking splendidly, and the east portion of the 1550-ft level particularly so. The ore breasts at the north portion of the 1400-ft level show improvement, and are yielding unusually well. The main drift at the 1550-ft level is being enlarged and retimbered, consequently no ore is hoisted through the Gould & Curry shaft at present, but all the ore is hoisted through the Con. shaft. Work at the 1700-ft level will not be resumed until the retimbering of the double winze above that level is completed. The C. & C. shaft is now down 125 feet below the 1500-ft level and has all the water the pumps can manage, rendering sinking progress rather slow—about two feet per day. Rock hard but blasting well.

HALE AND NORCROSS.—The pumps have been working admirably for the last few days, and the water is reduced 210 feet. The water is thrown up to the tank of the main line of pumps a distance of 250 feet by two lively working force pumps—a No. 7 Cameron and a No. 5 Knowles. A large No. 8 Cameron has been sent for, which will arrive in a few days to take the place of either of those now in such arduous use, which may happen to give out. When the water is lowered 50 feet more the 1900-ft station will be reached and an extension of the main line of pumps will be made in that point. The balance bob pit at the 400-ft station for the pump is not yet completed.

SUPERIOR.—Drifting west at the 150-ft level, ten feet above the bottom of the shaft, goes ahead prosperously as usual, and the increased amount of fine looking quartz stringers coming in at the face indicates a near proximity to the main ledge. Water does not trouble.

CROWN POINT.—Daily yield as usual 60 tons, keeping the company's mill, the Rhode Island, steadily running. The main incline is steadily being sunk, and is now down some 30 feet below the 1800-ft station, with the bottom in favorable working rock. North drift at the 1700-ft level pushing steadily ahead toward connecting with the Yellow Jacket mine. Two cross-cuts have been started from this drift, 100 feet from the south line, going east and west in hopes of striking ore, but without any success as yet.

TWIN PEAKS.—The road to the mine is successfully completed, and sinking the new three-compartment working shaft is resumed under the most favorable auspices. This mine is very eligibly situated in the heart of the great, broad Comstock ore belt, a short distance east of Gold Hill, and showing a fine ledge of white Comstock ore from the surface down to a depth of 80 feet, the depth of the old workings. The main body of quartz developed is about 10 feet wide, and gave assays of nearly $100 to the ton, two-thirds of which was silver. This, however, is merely a surface feeder belonging to the main ore vein which this new shaft is expected to develop.

SUTRO TUNNEL.—Total length from month to face of header this morning, 14,444 feet. Very fair average progress is being made at present, the face being in favorable working material, composed of hard porphyry, with quartz and clay streaks. A heavy stream of water flows from the tunnel, sufficient to supply several mills in case they were needed. And the chances are that the mills will be needed sooner or later, for very excellent ore prospects and assays have been met with at various points thus far already, and the tunnel has penetrated the regular broad Comstock ore belt for over 2,000 feet. A bonanza may be run into by the Sutro tunnel at any time.

BULLION.—The north drift at the 1400-ft level, and the drifts east at the 1600 and 1500-ft levels are being driven ahead as usual, with good prospects. The main drift north, at the 1700-ft level, is being cleared of waste rock, etc., preparatory to reopening active work in a few days. At the 2000-ft level connection was made with the Imperial drift last Sunday, which is of great benefit to both mines in the way of ventilation. Work is resumed in the main northeast drift at this level. The face is in very promising material, showing near proximity to the ore vein.

DAYTON.—Sinking the shaft is resumed and proceeding steadily along, with the bottom in favorable ground. The cross-cuts at the 800-ft level are being

pnehed steadily ahead, and at the 500-ft level the crosscuts are showing improvement, showing more quartz which gives better assays.

Gould & Curry.—Good work is being done sinking the joint winze below the 1600-ft level at the Savage line. There is a strong force of men hurrying up work on the massive stone foundatione for the large and powerful new pumping engine.

Baltio Con.—Main west drift has cut through to what is considered to he the west wall. The vein matter passed through has heen of a highly favorable character, and next to the west wall a vein of splendid quartz of the white Comstock character ie found, carrying heavy mineral indications. Thie is now being drifted npon to the northward to ascertain its real value in that direction.

Yellow Jacket.—At the 2040-ft level the south drift is in dry, soft ground, principally quartz, and is now heing timbered. The east crose cut drift at the same level during the past week hae passed through eeveral clay seams running to the southeast, with some seepage of water.

Cosmopolitan.—The stopes continue their excellent yield of good milling ore, and the ore vein developed by the winze below the main adit level is showing finely. At the depth of 60 feet it ie over four feet in width, and a drift from the winze at that point is heing run north, taking out the ore. The Hope mill will commence running on ore from this mine next week.

Tecoan.—Shaft down 270 feet. Material at bottom hard porphyry with tough clay seame and occaeional stringers of ore, dipping to the southeast in the direction of the good ore body passed through by the shaft.

Baltimore ann American Flat.—The drifte north and south at the 1050-ft level are eteadily advanclng, the south drift showing more and better quartz in its face.

Utah.—Very good progress is heing made in the cutting out and construction of the pump tank and bob pit, further sinking of the shaft being suspended for the purpose.

Alabama.—Shaft 167 feet dcep, and sinking at present in fine looking streaks of ledge porhyry, clay and quartz. Some of this gives very fair assaye, and is in fact low grade ore.

Alpha.—Connection being made witb the Imperial at the 2000-ft level, giving valuable and much needed ventilation, work is resumed in the main northeast drift towarde the ore vein.

Aureola.—Shaft down 55 feet to-day. Heavy veins of solid quartz are coming in from the weet side, with layers of clay hetween; evidently the outskirts of the main ledge.

North Con. Viroinia.—The new machinery operates as smoothly and efficiently ae could be desired, and no trouhle is experienced in keeping the sbaft free from water.

Julia.—Drift east from the shaft at the 1800-ft level is in 247 feet; face in favorable working veiu matter. South drift at the same level is in 388 feet; face in low grade ore, showing constant improvement and giving good promise of running into a paying ore body. The south drift at the 1600-ft level is also showing well and very promising, passing through fine looking vein material, with occasional small bunches and streaks of pretty fair ore.

Lady Bryan.—The new joint shaft is getting along finely. The hottom ie in good working ground. According to the developed workings of the mine heretofore, thie new shaft should soon cut into a ledge of a dozen feet in width of low grade ore.

Imperial Con.—Ore extraction going ahead as usual at the 2000-ft level, and everything running all right again throughout the mine. The water is drained from the shaft and work going ahead ae hefore in the drift from the south winze, also in the north drift. Tbe connection made with the Alpha drift at the 2000-ft level is of great importance, giving an excellent and much needed circulation of air and cooling both mines considerably.

Florida.—The northwest drift at the 400-ft level is 500 feet in length, and the face ie in eoft and very favorable vein matter, with considerable quartz, heavily charged with iron pyrites.

Ward.—Total depth of shaft to-day, 633 feet. Hard blasting rock at bottom, with plenty of water, but the rock hlasts well and the water is easily handled. Two and three feet per day is the regular progress made.

Cholilas Potosi.—Daily yield, about 100 tons of ore, assaying $27 per ton from average car samples. No change to report of the old ore sections, the varione stopes and breasts holding out and looking ahout ae well ae usual.

Resumption.—The exploration of the ledge by means of the old tunnel and eide drifts continues with excellent success. Large quantitiee of fair grade ore are met with.

Prospect.—Drifting west at the 400-ft level toward the ledge. A hoisting tank ie used now to raiee the wster from the sump of the shaft, that heing much cheaper than running the pump and fully as efficient.

Silver Hill.—Face of the north drift at 444-ft level continues in fine looking vein matter, and at the 650-ft level the east drift shows no special change.

North Careon.—Sinking the shaft progresses at a very eatisfactory rate. It is cutting into the ore vein developed at the 300-ft level, judging from the seams and bunchee of ore met with.

Tahoe.—Very good progress continues to he made in sinking the shaft, the bottom being in very favorable ledge matter, with stringere of quartz and low grade ore coming in.

Sierra Nevada.—Owing to the great amonnt of water met witb at the 1700-ft level sinking the shaft is not yet reeumed. Prospecting operations at the upper levele go ahead as usual.

Buckeye.—Drifts north and south steadily advancing, with good prospecte, especially in the north drift. The Hope mill is engaged to run on ore from tbis mine shortly.

Mint.—Total depth of shaft 1,255 feet. Material at hottom easy working porphyry, quartz and clay, with very good ore body indications coming in.

Caloutta.—The diamond drill hae penetrated to the depth of 280 feet, passing through considerahle quartz, giving good aseays. Work driving ahead.

West Belcher.—The extraction of ore from the upraise and the main drift at the 300-ft level continues with plenty in sight.

Belcher.—Daily yield, 300 tons. The old ore hreasts hold out excellently well, although showing no particular improvement in any direction. South drift at tbe 1500-ft level driving shead as usual and looking well.

Ophir.—Daily yield continues to be about 300 tons. The varioue ore stopes and hreasts show no signs of giving out, more particularly at the 1600-ft level, where in the eastern portion especially, considerahle improvement is noticeable. The north drift at the 1200-ft level is also showing finely.

Lady Washington.—Shaft down 850 feet. It le now proposed to start an incline from the hottom of the shaft, or the 850-ft level, to follow the dip of the ledge.

Amazon & Glasgow.—The balir g tanks are doing good service keeping the water redneed in the shaft till this new pump can be put in.

Phil. Sheridan.—Shaft down 337 feet. Rock at hottom very hard hut hlasts well. Owing to the arrangement to catch the water flowing from the 200-ft level no trouble is found in sinking from tbat source. Crosscutting will be commenced soon.

Globe Con.—North and south drifts at the 300-ft level are showing well, the faces of hoth heing in fine looking vein matter, with streaks and hunches of low grade ore.

Herald.—The good bonanza indications developed in the incline still continue and will be furthor sought for by a drift to the northward.

Savage.—The reduction of the water and repalre of the incline proceed actively ae usual.

Continued on Page 244.

Continued from Page 234.

psss and about 100 feet helow it, heving sn sltitude of 6,500 feet above the sea-level. Dr. Webber, the proprietor, hss heen here about twenty-one yesrs, snd, after many trials, has succeeded in stocking the lske with what he calls silver trout, a kind which thrive and keep fat in these waters. There is a good hotel here, sccessible hy stage from Truckee, which is the railroad station for this place. The fishing here is excellent; there are plenty of boats on the lake, und the guest is kindly furnished with trolling lines and spoons, or with lines snd hait for still fishing, or, if preferred, he csn use the fly.

We went out one morning and csptured seven or eight before breakfast, weighing from a pound to two and one-bslf pounds, and st night a party, torch fishing, brought in twenty-two in a short time.

The air was keen enough in the early morning to make one think of winter, and s little snow fell during the night. Large bodies of snow which fell last winter csn he seen upon the mountains all sround, in some places still 30 or 40 feet deep although exposed to the sun on the southern sides of the mountains.
